PREFACE

ELSEWHERE in this issue of THE NEW INTERNATIONAL YEAR BOOK is recorded the death, after a short illness, of its late Editor, DR. FRANK H. VIZETELLY. The plan and organization of this YEAR BOOK, however, had been so fully developed by him that the present Editor has had little to do except to carry the work to its completion. Whatever the degree to which this record has reached the high standards set in former years is therefore due to the genius of its late Editor and to the loyal co-operation of his associates and staff. No change in the editorial policy has been made except in the reduction of the length of certain articles of less general interest in order to provide additional space in which to record the many surprising events of the year.

As in previous years, the YEAR BOOK covers the outstanding events and developments in all fields of interest during 1938: Sports and Spanish Literature; Botany and Boy Scouts; Theology and Geology; Military Progress and Peace Conferences—whatever the year has produced in agriculture, art, science, law, medicine, philosophy, politics, or other activity that our large staff of contributors and editors has considered to be worthy of note is recorded herein.

Economic and industrial conditions in the United States showed little change, either for the better or for the worse, during the first half of the year. But, in the words of MR. PHILIP COAN, whose department embraces each of the 48 States and the United States as a whole:

"The return of economic adversity, which began in 1937, made itself felt throughout the Nation in 1938. The Federal Government had recourse anew to widespread dispensations of public money. While business, under this stimulus, improved from June until early December, the year closed without definite indication as to whether the gain could be maintained without persistent administration of the stimulant. Legislation in the field of social planning, though less abundant than in most of the previous five years, included the enactment of a system for Federal regulation of wages and hours of employment in interstate industries—another and a potentially important Federal intervention in social and economic relations. Dissension within the Tennessee Valley Authority led Congress to investigate the conduct and policies of this foremost of the Federal ventures into the field of economic production.

"Elections to the 76th Congress brought about an altered alignment both among the lawgivers and among the people of the United States; the popular votes cast in the State primary elections and in the general election of November 8 not only strengthened the Republicans and anti-Administration Democrats in Congress, at the cost of the New Deal's supporters, but also made evident a considerable popular shift away from the liberalism of the Administration. The proposals and policies of President Roosevelt had won ample support in each of three previous elections to Congress; the turn of this long-persistent tide of sentiment, as seen in the vote of 1938, rendered the elections the most important domestic occurrence of the year. Since the apparent change in the people's views might affect the conduct of the Nation's affairs for some time to come, the articles on the United States and on the individual States give the election somewhat extended treatment, as a matter fundamental to the comprehension of events to come."

Full treatment of each phase suggested in those two brief paragraphs may be found under appropriate headings within this summary of the year. In addition, the separate activities in Engineering, in Mining, in the various fields of industry—Agriculture, Aviation, Automobile, Steel, Textile—in Finance and Banking, both at home and abroad, are each covered under the respective headings. Labor disputes during 1938 were fewer in number and of far less serious nature than in the previous year. The reduction was due in part to ameliorated conditions of labor, in part to the passage of the Wages and Hours Act, and in part to a definite swing in public opinion against methods, such as the "sit-down" strikes, employed by labor in recent disputes. As MR. LOUIS M. HACKER points out in his review of Labor and kindred topics, the newspaper headlines gave more attention to disputes within the ranks of labor in 1938 than to disputes between labor and employer.

The world at large, however, was in unrest almost from the beginning of the year. Great Britain, with its large interests extending over the entire globe, was kept continually agitated in the effort to maintain undisturbed trade relations and to keep the numerous foreign fires from spreading into a general conflagration. To that end she made concession upon concession, but whether in so doing she sacrificed her prestige was still a moot point at the end of the year, though her diplomatic efforts appeared then likely to be successful. The events which caused the major disturbances are thus summarized by MR. RONALD S. KAIN, Associate Editor in charge:

"Outstanding developments of the year in Europe were Germany's annexation of Austria in March; the Munich accord of September 30; the subsequent partition of large areas of Czecho-Slovakia among Germany, Poland, and Hungary, with the remnants of the republic becoming a satellite of the Reich; the consequent establishment of unquestioned German economic and military predominance in central and eastern Europe; the strengthening of the Rome-Berlin axis; the steady progress of Franco's Insurgent armies, with Italo-German support, in the Spanish civil war; the tightening of the Anglo-French alliance; Prime Minister Chamberlain's effort to appease the dictators by giving Hitler a free hand in eastern and central Europe, withholding aid from the Spanish Loyalists, and recognizing Italy's sovereignty over Ethiopia; the Anglo-Italian accord; the tension created between

PREFACE

Italy and France by the Italian agitation, launched November 30, for greater territorial and other concessions. Also the triumph of the radical wing of the Nazi party in Germany, followed by violent attacks upon the Jews and acceleration of the collectivist reorganization of the Reich for military and social purposes; the replacement of the Popular Front's rule in France by Daladier's middle-of-the-road government; the resignation of Anthony Eden as British Foreign Secretary in protest against the Chamberlain appeasement policy; and the Anglo-Irish settlement.

"In China the Japanese invaders made marked progress without administering a knockout blow to Gen. Chiang Kai-shek's Nationalist regime. Nippon's expansion on the Asiatic mainland was deflected southward by the determined opposition encountered from Soviet troops in the August clashes at Changkufeng and by the Anglo-French capitulation to Hitler at Munich. In October, Japan defied Britain by capturing Canton and isolating Hong Kong. France's possessions in Indo-China were endangered. The Arab revolt in Palestine offered another threat to the British Empire's security.

"In the New World, 1938 witnessed the strengthening of inter-American solidarity at the Lima Conference; the Mexican oil expropriations; abortive Nazi-Fascist revolts in Brazil and Chile; the victory of the Popular Front in the Chilean presidential election; the final settlement of the Chaco Dispute; and the conclusion of the Anglo-American and Canadian-American trade pacts. In all countries the growing world chaos caused increased armament expenditures. The world spent some 16 billion dollars on arms and munitions during 1938."

We welcome among the new contributors to the YEAR BOOK, Mr. DOUGLAS HASKELL, contributing editor of *The Architectural Review*, who has supplied the article on ARCHITECTURE; Mr. G. ROSS HENNINGER, editor, American Institute of Electrical Engineers, who has presented the articles on electrical engineering; Mr. CHARLES S. HUGHES, formerly of the U.S. Shipping Board, who has prepared the various articles on mineral production; Mr. H. CHARLES RAWLINS, editor of *Sport*, who has covered all branches of athletic competitions, and Mr. WALTER H. BEAL of the U.S. Department of Agriculture, who has developed the articles FERTILIZERS and SOILS.

As in the past, the co-operation of the officers of the various Departments of the United States Government and of their allied Bureaus, and of the officers of other Governments who have supplied valued information concerning their respective countries, is gratefully acknowledged. Appreciative thanks are also tendered to the officers of numerous Corporations, Companies, Associations, and Institutions who have contributed material that guarantees the accuracy of their respective interests. And finally, once again we pay a warm tribute of appreciation to the members of the editorial staff who have worked loyally, harmoniously, and efficiently under trying conditions toward the completion of this work. The surviving Editor cannot express too warmly his personal thanks to each and especially to his two Associates, Mr. RONALD S. KAIN and Miss HELEN READY BIRD, through whose experience and industry it has been again possible for this YEAR BOOK to take a proud place among its predecessors in the homes, the colleges, the libraries, and the newspaper offices of the country.

KEY TO PRONUNCIATION

E as in ale, fate. Also see *ē*, below.
ē " " senate, chaotic.
ē " " glare, care, and as *e* in there. See *ē*, below.
ē " " am, at.
ē " " arm, father.
ā " " ant, and final *a* in America, armada, etc.
 In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short *u* (*ū*).
α " " final, regal, where it is of a neutral or obscure quality.
ā " " all, fall.
ē " " eve.
ē " " elate, evade.
ē " " end, pet. The characters *ē*, *ā*, and *ā* are used for *ä*, *ae* in German, as in Baedeker, Gräfe, Händel, to the values of which they are the nearest English vowel sounds. The sound of Swedish *ä* is also sometimes indicated by *ē*, sometimes by *ā* or *ā*.
ē " " fern, her, and as *i* in sir. Also for *ē*, *oe*, in German, as in Göthe, Goethe, Ortel, Oertel, and for *eu* and *oeu* in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.
e " " agency, judgment, where it is of a neutral or obscure quality, *ē*.
i " " ice, quiet.
i " " quiescent.
i " " ill, fit.
ō " " old, sober.
ō " " obey, sobriety.
ō " " orb, nor.
ō " " odd, forest, not.
o " " atom, carol, where it has a neutral or obscure quality.
oi " " oil, boil, and for *eu* in German, as in Feuerbach.
ō " " food, fool, and as *u* in rude, rule.
oo " " foot, wool.
ou " " house, mouse.
ū " " use, mule.
ū " " unite.
ū " " cut, but.
ū " " full, put, or as *oo* in foot, book. Also for *ū* in German, as in München, Müller, and *u* in French, as in Buchez, Budé; to which it approximates in English.
ū " " urn, burn.
y " " yet, yield.
u " " the Spanish Habana, Córdoba, where it is like a *v* made with the lips alone, instead of with the teeth and lips.
ch " " chair, cheese.

D as in the Spanish Almodovar, pulgada, where it is nearly like *th* in English then, this.
g " " go, get.
g " " the German Landtag, and *ch* in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
H " " *j* in the Spanish Jijona, *g* in the Spanish gila; where it is a fricative somewhat resembling the sound of *h* in English hue or *y* in yet, but stronger.
hw " " *wh* in which.
K " " *ch* in the German ich, Albrecht, and *g* in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of *h* in hue, or *y* in yet; or the sound made by beginning to pronounce a *k*, but not completing the stoppage of the breath. The character *κ* is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of *kh* in the word Khan.
ñ " " in sinker, longer.
ng " " sing, long.
N " " the French bon, Bourbon, and *m* in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by *N*, as in the case of São Antão.
sh " " shine, shut.
th " " thrust, thin.
TH " " then, this.
zh " " *z* in azure, and *s* in pleasure.
 An apostrophe (') is sometimes used to denote a glide or neutral connecting vowel, as in *tā'b'l* (table), *kāz'm* (chasm).
 Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
 When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English and other words which are correctly accented. Pronunciation is discussed fully in THE NEW INTERNATIONAL ENCYCLOPÆDIA and in the NEW STANDARD DICTIONARY.

THE NEW INTERNATIONAL YEAR BOOK

ABEL, JOHN JACOB. An American pharmacologist, died in Baltimore, Md., May 26, 1938. Born in Cleveland, Ohio, May 19, 1857, he attended the University of Michigan from 1876 to 1879 when he became principal of the high school at La Porte, Ind., and superintendent of the public schools there in 1880. He returned to the University in 1882 and took his degree of Ph.B. in the following year. Upon graduation he did graduate work at Johns Hopkins University, and in 1884 went abroad, where he studied at the universities of Leipzig, Strassburg (M.D., 1888), Heidelberg, Vienna, Berne, Wurzburg, and Berlin. Returning to the United States in 1891, he was appointed lecturer and professor of materia medica and therapeutics at the University of Michigan. He remained there until 1893 when he was invited to become the first professor of pharmacology at Johns Hopkins. In 1932 he was retired as professor emeritus and then became the director of the Laboratory of Endocrine Research, where he worked until shortly before his death.

One of the earliest workers on hormones, in 1895 he began his researches that resulted in the isolation of the hormone which later enabled other scientists to obtain the pure crystalline hormone. Subsequently, he successfully isolated the external secretion of a tropical toad to obtain epinephrine. In 1926 he succeeded in isolating the hormone of insulin. These achievements classed him as of the first rank in science, and in 1927 he was awarded the Willard Gibbs Medal of the American Chemical Society in recognition of the scientific achievements by which he became accepted as the "chief of the forces of science in creating human happiness."

Considered the foremost authority on the chemistry of the ductless glands and known as the "Father of American Pharmacology," Dr. Abel was associate editor of the *Journal of Experimental Medicine* from 1896 to 1905, when, with Dr. C. A. Herter, he founded the *Journal of Biological Chemistry*. He edited this until 1909 when he founded the *Journal of Pharmacology and Experimental Therapeutics*. In 1932 he retired as emeritus. He organized and founded the American Society of Biological Chemists in 1906 (president, 1908) and the American Society of Pharmacology and Experimental Therapeutics (president, 1908), and in 1932 was elected president of the American Association for the Advancement of Science. A day or two before he died he was elected to membership in the Royal Society, London.

His lectures—Mellon, Harvey, Kober, and Willard Gibbs—all dealt with internal secretions, and

his writings with the subjects of his various researches. He was awarded the Research Corporation Prize (1925), the gold medal of the Society of Apothecaries, London (1928), the Philip A. Conné medal of the New York Chemists' Club (1932), and the Kober medal (1934).

ABYSSINIA (ETHIOPIA). See ITALIAN EAST AFRICA.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France and officially considered the highest; founded in 1635. The membership is limited to 40. The list of the Immortals in 1938, in order of their election, was as follows: Gabriel Hanotaux; Henri Lavedan; Maurice Donnay; Marcel Prévost; Henri Bergson; Mgr. Alfred Baudrillart; Henri Bordeaux; Joseph Bédier (q.v.); André Chevrillon; Georges Goyau; Édouard Estaunié; Georges Lecomte; Émile Picard; Louis Bertrand; Auguste de Caumont, Duc de la Force; Paul Valéry; Abel Hermant; Émile Mâle; Louis Madelin; Maurice Paléologue; Marshal Henri Pétain; André Chaumeix; Gen. Max Weygand; Pierre Benoit; Abel Bonnard; François Mauriac; Maurice, Duc de Broglie; Léon Bérard; Marshal Louis Franchet d'Espérey; Claude Farrère; André Bellessort; Georges Duhamel; Louis Gillet; Edmond Jaloux; Joseph de Pesquidoux; Lucien Lacaze; Mgr. Grente, Bishop of Le Mans; and Jacques de Lacretelle.

On June 9, 1938, Charles Maurras was elected to succeed René Doumic, on June 23, André Maurois to succeed Henri Robert, and on December 1, Jérôme Tharaud to succeed Joseph Bédier.

ACADEMY OF ARTS AND LETTERS, AMERICAN. A society founded in 1904 by members of the National Institute of Arts and Letters for the purpose of furthering and representing the interests of literature, painting, sculpture, architecture, and music. Its membership is limited to 50 chairs, vacancies caused by death being filled by elections from the membership of the Institute.

The membership of the Academy as of Nov. 10, 1938, consisted of the following in the order of their election: George de Forest Brush, Bliss Perry, Abbott Lawrence Lowell, Nicholas Murray Butler, Herbert Adams, Robert Grant, Hamlin Garland, Archer Milton Huntington, Newton Booth Tarkington, Charles Dana Gibson, Royal Cortissoz, Charles Downer Hazen, Wilbur L. Cross, Hermon A. MacNeil, James Earle Fraser, John Huston Finley, William Mitchell Kendall,

Edwin Markham, Robert Frost, James Truslow Adams, William Lyon Phelps, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, Paul Manship, Cecilia Beaux, Eugene O'Neill, Henry Dwight Sedgwick, Walter Lippmann, Frederick J. E. Woodbridge, M. A. de Wolfe Howe, Frank Jewett Mather, Jr., Stewart Edward White, Deems Taylor, Sidney Howard, Charles McLean Andrews, Van Wyck Brooks, Herbert Putnam, Jonas Lie, William Adams Delano, Charles Warren, Bernard Berenson, Frederick Shepherd Converse, Chauncey Brewster Tinker, Albert Spalding, and Sinclair Lewis. At the Annual Meeting held Nov. 10, 1938, the following members were elected: Willa Cather and Stephen Vincent Benét. In December Ellen Glasgow and Thornton Wilder were elected to membership.

From November to May of each year the Permanent Museum and the Art Gallery of the Academy are open and free to the public from 10 a.m. to 5 p.m. on week days and from 2 p.m. to 5 p.m. on Sundays. This season a special exhibition of the works of Charles Adams Platt, a former Academy member, are being shown in the Art Gallery.

All Officers and Directors of the Academy were re-elected for 1938-39. They are: President, Nicholas Murray Butler; Chancellor and Treasurer, Wilbur L. Cross; Secretary, William Lyon Phelps; Directors: Herbert Adams, Royal Cortissoz, Charles Dana Gibson, Robert Grant, Charles Downer Hazen, Archer Milton Huntington, and William Lyon Phelps. Administrative offices are at 633 West 155th St., New York City.

ACOUSTICS. See PHYSICS.

ADELPHI COLLEGE. A nonsectarian college of liberal arts for women located in Garden City, New York, incorporated in 1896. Adelphi was situated in Brooklyn, New York, until the autumn of 1929 when it moved to its present location in Garden City, where it has a campus of about 70 acres and three buildings. The enrollment for the autumn term of 1938 was 423 and for the summer session of 1938 was 72. The faculty numbered 49. The endowment was \$43,151, while the income for 1937-38 was \$178,348. The Library contained 31,804 volumes. President, Paul Dawson Eddy, A.M.

ADEN. See ARABIA.

ADULT EDUCATION, AMERICAN ASSOCIATION FOR. A membership organization founded in 1926 for the purpose of furthering the idea of education as a continuing process throughout life. During the last decade the Association has served as a clearing house of information concerning adult education activities; has assisted enterprises already in operation; has helped organizations and groups to initiate activities; and has conducted or sponsored studies and demonstrations. Over 70 books and pamphlets on methods and practice in adult education have been published by the Association or issued under its sponsorship. The *Annual Report of the Director of the Association* is published in May of each year; the *Journal of Adult Education* (the official organ of the Association) is issued in October, January, April, and June. Support for the activities of the Association has been derived from membership fees and from grants made by the Carnegie Corporation of New York.

During 1936-37 a change was made in the program of the Association. Emphasis formerly placed upon experimentation and demonstration was shifted to a study program. The Association is con-

ducting over a five-year period a study of the social significance of adult education in the United States in order to discover the meaning and estimate the worth of adult education as a social movement among the other social movements.

Studies published in 1938 were: *The Music of the People*, by Willem van de Wall; *Women in Two Worlds*, by Mary L. Ely and Eve Chapell; *Man-Made Culture*, by Frank Ernest Hill; *The Public Library—A People's University*, by Alvin Johnson; *Outposts of the Public School*, by Watson Dickerman; *Parents in Perplexity*, by Jean Carter; *Everyman's Drama*, by Jean Carter and Jess Ogden; *Rural America Reads*, by Marion Humble.

The 1938 annual meeting was held in May at Asbury Park, N. J. The following officers were elected: John H. Finley, president; James E. Russell, honorary chairman; Alvin Johnson, chairman; Linda A. Eastman, Hans Kohn, Alexander Meiklejohn, Agnes Seansongood, John W. Studebaker, vice-presidents; Jennie M. Flexner, secretary, and Harold Stonier, treasurer. Headquarters: 60 East 42d St., New York City. Director, Morse A. Cartwright. See LIBRARY PROGRESS.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. An organization founded in 1848 to advance science to give a stronger and more general impulse and systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and wider usefulness. On Sept. 30, 1938, its membership included 19,347 co-operating individuals. As a general association of the numerous American societies for the advancement of the special sciences, it consisted of 167 autonomous and independent associated scientific societies, 32 being local academies of science.

The Association holds two meetings during the year, one in the summer and the regular annual meeting in December. The last summer meeting was held in Ottawa, June 27 to July 2, 1938, with an attendance of about 1800.

The next meeting, the 103d, was held in Richmond, Va., Dec. 27 to 31, 1938. Although the registered attendance was about 2500, it is estimated that approximately 5000 were in attendance at the various sessions. About 40 affiliated and associated organizations met with the Association together with its 15 sections in connection with the Richmond meeting. Of the 1700 papers presented at the various sessions of the sections and societies, the prize of \$1000 for describing a noteworthy contribution to science was awarded to Dr. Norman R. F. Maier of the University of Michigan for a paper on "Experimentally Produced Neurotic Behavior in the Rat." At this meeting Dr. Charles F. Code, of the Mayo Foundation of the University of Minnesota, read his paper on "The Blood Histamine in Normal and Certain Abnormal Conditions" for which he received the Theobald Smith Award in medical sciences consisting of a bronze medal and a prize of \$1000.

The official organ of the Association is the weekly journal, *Science*. In addition it issues *The Scientific Monthly*, an illustrated magazine of timely articles of general interest by eminent men of science. The permanent endowment of the Association, the income from which is employed to advance scientific research, amounted on Sept. 30, 1938, to about \$242,550.

The president of the Association for 1938 was Dr. Wesley C. Mitchell, Columbia University. The president-elect for 1939 is Dr. Walter B. Cannon, professor of physiology, Harvard University. The

other officers for 1939 were: General secretary, Otis W. Caldwell; treasurer, John L. Wirt; permanent secretary, F. R. Moulton. Headquarters are in the Smithsonian Institution Building, Washington, D. C.

ADVENTISTS. In America the Advent Movement owed its origin to William Miller (1782-1849), who from 1831 taught not only that Christ was coming in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. For the early history of the Movement see *THE NEW INTERNATIONAL ENCYCLOPEDIA*, vol. i, pp. 158 ff.

Advent Christian Church. This Church holds simply to the general imminence of Christ's return but takes the position that the day cannot be determined. Headquarters of the general conference are at 160 Warren Street, Boston, Mass.

Seventh-Day Adventists. This denomination, which is the largest of the Adventist group, embraces 10 union conferences in the United States and Canada. It believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. On the basis of Biblical prophecy, including the prophecy of Christ himself, it teaches the imminence of Christ's second coming, and the end of this world.

The statistical report of the denomination for 1937 indicated 2508 churches in the North American division, 1033 ordained ministers, and 164,490 church members; Sabbath schools, which numbered 2978, had a membership of 151,003. Total contributions from all sources in 1937 amounted to \$8,350,325.41 for the North American Division, and \$4,262,854.21 for the other divisions.

The foreign divisions, including the Australasian, Central European, Chinese, Far Eastern, Inter-American, Northern European, Southern African, South American, Southern Asian, Southern European, and Union of Soviet Socialist Republic divisions, consisted of 5880 churches, 1452 ordained ministers, 288,268 church members, and 10,342 Sabbath schools, with an enrollment of 402,386. Throughout the world there was an increase in membership of 14,619 over 1936. The work was conducted in 385 countries and islands by 69 union conferences, 145 local conferences, and 333 mission field organizations, employing 28,029 evangelistic and institutional laborers, who are using in their work 714 languages and dialects.

The denomination maintains in the United States and Canada 129 educational institutions, which in 1937-38 had an enrollment of 19,271 students. There also are maintained in foreign countries 114 educational institutions with an enrollment of 12,799 students. The denomination has 19 publishing houses in North America and 56 in other countries. The principal periodicals are the *Advent Review and Sabbath Herald*, *Signs of the Times*, *The Watchman Magazine*, *The Canadian Watchman*, *Life and Health*, *Health*, *Liberty*. In all there are 310 periodicals published by the denomination, in 55 languages. Literature in all forms is issued in 194 languages, sales of which, in 1937, aggregated \$4,066,181.07.

The headquarters of the General Conference are at Takoma Park, Washington, D. C.

ADVISORY COMMITTEE ON EDUCATION. See EDUCATION IN THE UNITED STATES.

ÆGEAN ISLANDS, ITALIAN. The islands of Rhodes (Rodi), Castellrosso (Castellrizo), and the Dodecanese group between the island of Crete and

Turkey in Asia. Total area, 977 square miles; total population (June 30, 1936), 140,948, compared with 134,384 (1933), of whom about 90 per cent were Greeks. Rhodes, the capital, had 27,466 inhabitants. Grapes, tobacco, oranges, olives, and vegetables are the main agricultural products. The manufacture of oriental carpets, wine, olive oil, pottery, and tiles are important industries. Production in metric tons was: Barley, 2400 (1934); olive oil, 1100 (1937-38 estimate); tobacco, 100 (1934). In 1935, 660,427 gallons of wine were produced. In 1936, imports were valued at 111,030,000 lire; exports, 13,193,000 lire (lira averaged \$0.0729 for 1936). There is a weekly air-mail service from Brindisi and Athens to Rhodes. In 1937 there were 391 miles of roads. For the financial year 1934-35 the budget was 48,000,000 lire; State contribution, 3,000,000 lire (lira averaged \$0.0825 for 1935). Government is administered by a governor subject to the Italian Foreign Office in Rome. Governor, Caesar Mary de Vecchi, Count of Val Cisman.

AERONAUTICS. Air Transport. In a year when the shifting tides of national and international politics were to leave their mark on almost every field of endeavor, air transport progress was more affected than ever before by its intimate association with governmental agencies. Nowhere was this more apparent than in the North Atlantic where the air lines of five nations continued preliminaries to the establishment of regular scheduled transport.

The long-projected plans for an airship service between Germany and the United States, for example, failed of realization solely because of the inavailability of American helium. Otherwise the Zeppelin Company was completely ready for service. The *LZ-130*, initially intended to be an almost exact sister ship of the ill-fated *Hindenburg*, was substantially redesigned and rebuilt at Friedrichshafen to permit the use of helium rather than the slightly more efficient hydrogen. A request for 19,800,000 cu. ft. of helium was entered with the U.S. government in accordance with the terms of the helium export law which Congress had amended after the *Hindenburg* crash to permit sale for any "non-military" use. Germany's new airship terminal at Frankfort was ready for service. A preliminary schedule for a summer's demonstration flight was announced. Then Secretary of the Interior Harold Ickes refused to approve the export, doubting that Germany wanted helium solely for non-military use. On September 14 the *LZ-130* was christened *Graf Zeppelin* and, inflated with hydrogen, started through a series of flight tests. The request for helium was from time to time renewed in Washington. Permission was even sought to fly the ship with its hydrogen charge to the United States. But at the year's end the anti-Nazi sentiment in the United States had so increased that helium export seemed more remote than ever.

That same sentiment was at least a contributing element to the situation which minimized the effectiveness of the elaborate program of transatlantic airplane flights carried out by Germany during the summer. Deutsche Lufthansa, Germany's official air trust, announced in May that it would once more demonstrate the catapulted mail-plane technique as it had done in 1936 and 1937—this time with a program of 28 crossings. It also expressed itself as being ready to begin immediately on a scheduled transatlantic mail service. July 21 the mother ship *Schwabenland* anchored off the Azores and fired the Diesel-powered seaplane *Nordmeer* down its catapult. Some 17 hours, 42 minutes later it swung in over the mother ship *Friesenland*

anchored in Long Island Sound. The following Monday the *Nordmeer* began its return flight to Horta. Meanwhile, the *Nordwind*, a sister ship, had come in from the Azores. From then until the middle of October one ship arrived after a westward crossing every Monday morning and another took off eastward every Monday evening. Not content with that the Germans sent Capt. Alfred Henke on a non-stop flight from Berlin to Floyd Bennett Field, L. I., on August 11, in a big four-engined Focke-Wulf Condor land transport christened the *Brandenburg*. Finishing the 3985-mile journey with three companions in just under 25 hours, Captain Henke took off August 13 on a return crossing. This time with favoring winds he reached Tempelhof, Berlin's huge airport, in 19 hours, 54 minutes. Meanwhile, on the catapult program Capt. Joachim Blankenburg made headlines on August 1 by completing his 100th airplane crossing of the North or South Atlantic. On September 12 a third seaplane of a somewhat newer model, the *Nordstern*, flew into New York in the record time of 13 hours, 35 minutes.

Great Britain's transatlantic program of 1938 was characteristically severely curtailed by the Air Ministry's preoccupation with its armament program. After announcing no less than six projected flights in three different types of aircraft, the British actually terminated their efforts after a single round-trip crossing. That one, however, was technologically of great interest. On July 20 the unique pick-a-back combination of the flying boat *Maia* and the seaplane *Mercury* took off together from the harbor at Foynes, Ireland. After reaching an altitude of 3000 feet the two ships uncoupled and the *Maia* returned to its base. Twenty hours, 19 minutes later the *Mercury* splashed to a landing at Montreal, delivering a half-ton load of mail, newspapers, and news-reels. The same day it came to Port Washington, L. I. July 27 it was once more back at Southampton after a homeward flight which included four stops made necessary by the ship's limited capacity when launched without the assistance of the *Maia*. Capt. D. C. T. Bennett, accompanied only by a radio man, piloted throughout the trip.

The French, likewise distracted by concern over the condition of their air arm, also fell far short of an announced program of six round-trip crossings. After extensive rebuilding the *Lieutenant de Vaisseau Paris*—huge six-engined Latécoère flying boat originally launched in 1934—took off August 18 from Biscarosse, near Bordeaux, but soon turned back due to propeller trouble. August 23 it took off once more, landed at Lisbon, then pushed on to the Azores. After several days' delay due to weather, it took off August 30 and completed a 22-hour, 48-minute crossing to Port Washington, L. I. On September 6 it started homeward, reaching Biscarosse after a flight "without incident" on September 9. Further crossings were indefinitely postponed by the crisis in European affairs which lead to the pact of Munich.

Save for the continued regular crossings between the United States and Bermuda by flying boats of Pan American Airways and Imperial Airways this completed air-line efforts in the North Atlantic. While such flights continued to command fair public interest they cannot be said to have markedly advanced the actual establishment of scheduled service. Actually, what real progress was made toward that goal took place elsewhere. In Seattle, Wash., the first of 41-ton flying boats which the Boeing Airplane Co. is building for the Pan

American Airways made its first test flight on June 8, and late in November was announced as due for delivery to the air line on December 25. The second ship of the six was at that time undergoing final assembly and the remaining four were well advanced. In the same factory the year's end also saw the first of three big Boeing landplanes destined for Pan American Airways reach completion. The initial trial flight was made on December 31. Equipped with superchargers not only for each of the four engines, but for the cabin as well, these planes were designed for long flights at altitudes up to 25,000 feet. Both of these new Boeing types, flying boat and seaplane, were expected to play an active part in the North Atlantic during 1939. In fact, delivery of two or three of the flying boats was expected to mean the immediate opening of scheduled operation for the transport of mail, passengers, and express between the United States, and at least, England.

In England the De Havilland aircraft works completed some five big four-engined landplanes of the Albatross type, which are also scheduled for experimental crossings to Canada. The first of the ships to be tested suffered an accident during load-carrying tests when its unique plywood construction failed, with the spectacular result that the entire rear end of the fuselage broke off after a landing. But the weak spot was detected and strengthened on the remaining planes. Also being made ready for 1939 Atlantic work was a Short Brothers Empire boat redesigned to permit an increased gross-loading from 42,000 to 48,000 lb. At the year's end came word that the Short Brothers had also started work on three huge landplanes of 71,000 lb. gross and three flying boats of 74,000 lb. gross.

In France the Latécoère Co. completed designs for a flying boat of 146,000 lb. gross loading, and the Potez Co. was far enough advanced on the development of its six-engined flying boat that it built a one-third scale model—itsself large enough to be flown as an ordinary airplane.

Thus the lack of airplanes of large enough dimensions to carry transatlantic loads of mail, passengers, and express was being actively fought on at least three fronts. During October it was learned that the American Export (Steamship) Co. had not only completed plans for survey flights in 1939, looking toward air-line operations to the Mediterranean area to supplement its steamship service; it had also worked out an agreement with Pan American Airways, setting up spheres of Atlantic exploitation for both companies. By its terms it is understood that Pan American will have special rights to operate to England and Scandinavia; American Export Airlines will have similar privileges in the Mediterranean. To the countries between those areas both companies are to share equally. American Export was also able to complete a working arrangement with Italy's air trust, Ala Littoria, similar to that existing for some time between Pan American Airways and Imperial Airways.

The North Atlantic was, of course, only one small part of the international air-transport picture. Across the South Atlantic, Germany and France continued to operate weekly mail flights and both prepared to institute supplementary passenger service in the near future. Significantly both Great Britain and Italy sent missions to Latin America during the year to work out details for setting up transport services across the South Atlantic sometime in 1939. In the Pacific, Pan American Air-

DOUGLAS DC-4 TRANSPORT

This giant 40-passenger transport made its first test flight in June and was to be delivered to the United Air Lines in January, 1939

ways' spectacular Clipper service encountered its first tragedies. On January 12 the Sikorsky flying boat *Samoan Clipper* took off from Pago Pago, American Samoa, on the last leg of a flight to New Zealand which would have inaugurated a regular air express service between Auckland and Honolulu. A few miles to the south-westward the ship suddenly burst into flames and crashed into the sea. Instantly killed with his seven fellow crewmembers was Capt. Edwin C. Musick (q.v.), Pan American Airways' oldest pilot and trail-blazer for the long 8000-mile route between California and Hong Kong. On July 29 the *Hawaii Clipper* left Guam bound for Manila. At 12:11 a.m. (N. Y. time) a radio message consisting of a routine report of its 565 miles from Manila position was received at Guam; a few minutes later the Guam operator was unable to renew contact. No further certain trace was ever afterward found of the plane, Captain Terletsky, his crew of eight, and six passengers.

On the world's international overland air routes there were few important route extensions. Germany continued survey flights for a service to China and Japan via Afghanistan. Great Britain made final preparations for a flying-boat service between Australia and New Zealand. Germans and Americans operating in Latin America slightly increased their networks. Pan American Airways started a program of survey flights between Seattle and Juneau, Alaska, using a Sikorsky amphibian, flying an all-water route.

All over the world the generalization was true that all the major international air lines carried more traffic in faster and more comfortable planes than they had the previous year. Imperial Airways completed a program, begun the year before, of replacing its landplane equipment with luxurious four-engined flying boats of the Short Empire class. As a result, flying time was materially reduced all over the system and routes could be relocated to eliminate several crossings of non-British territory. London to Alexandria became a two-day, all-air journey; Alexandria to South Africa was reduced to four days, the route being shifted to the east coast and the African terminal being shifted from Capetown to Durban; from Alexandria to Calcutta new schedules were set at three days which brought the total London to Calcutta time down to five days, with a further three days' flight all that was required to put mail and passengers into Australia. By October, Imperial had also put into service the first of her Armstrong-Whitworth four-engined Ensign landplanes on the London-Paris run, and had begun service tests on its first De Havilland Albatross; both these ships had been considerably delayed by the press of military business in British factories, and were badly needed on Imperial's services to European capitals. The comparative obsolescence of Imperial's equipment prior to these deliveries had, in fact, aroused so much criticism in Parliament that in November, 1937, His Majesty's government appointed a board of inquiry headed by Lord Cadman which in April issued a complete report on Imperial, finding many things to criticize, but also in many ways defending the company's management.

Probably the most significant British transport development of the year, however, was the extension of the "Empire Air Mail Plan" to all Imperial routes; by this plan all first-class letters weighing less than half an ounce dispatched from England to any portion of the empire reached by Imperial planes were carried by plane as a matter of course

and without extra postage. Such a plan had been used by the air lines of several Scandinavian countries since 1926 and had been used on Imperial and British Airways lines to the Continent since 1936.

During 1938 England's number two company, British Airways, rose swiftly in prominence. Operating routes to Scandinavia, Germany, and Paris, it continued to purchase high-performance Lockheed transports from the United States and steadily increased its patronage. In August it was this line which so dramatically carried Prime Minister Chamberlain to Germany for his three conferences with Hitler. The Cadman report had recommended that British Airways be definitely recognized as His Majesty's "chosen instrument" for development of British lines to the continent while Imperial concentrated on lines to various parts of the British Empire. Also during the year British Airways was selected to make surveys for and project a route to South America for 1939.

Thus matters stood until late November when Sir Arthur Kingsley Wood, appointed Secretary for Air in May, announced a plan to combine Imperial and British Airways into a single corporation, largely government-owned and directed. Shareholders in the two extant companies were to be reimbursed on a "fair and reasonable" basis, but at the year's end the ideal had not yet been completely accepted and had been attacked as "Tory Socialism." It seemed certain, however, to go through as a part of Britain's determination to maintain a leading position in world air transport.

Air France continued to operate its long services to South America and to French Indo-China, cutting running time on the latter service to a six-day schedule to match Imperial Airways through the use of Dewoitine type 338 air liners. On its European services it also speeded schedules through the use of Bloch-type 220 transports, low-winged twin-engined monoplanes which cruise at 200 m.p.h. while carrying 16 passengers. As a result of this improved service, Air France took a marked leadership over the British in London-Paris traffic.

The Royal Netherlands Airline continued to justify its reputation as "the most thoroughly Americanized air line in Europe." Adding steadily to its fleet of Douglas transports, it, too, slashed flying time to its eastern terminal in the Dutch East Indies. Late in the year it added to this long route an extension to Port Darwin, Australia. It also made very substantial progress in its services in Dutch Guiana. At the year's end it was planning an almost complete relocation of its Asiatic services. Under the new set-up the Netherlands intend to cut straight across Europe from Germany to Basra, thence to Colombo, Ceylon, off the southern tip of India, thence to Batavia; flying day and night they will cut their five-and-a-half-day trip to two and a half. Part and parcel of the plan is the use of four-engined landplanes presumably of the new Douglas DC-4 type, although corresponding German equipment was also being considered.

Germany's Lufthansa improved its services through the widespread substitution of four-engined Junkers Ju 90s (40 passengers) and Focke-Wulf Condors (26 passengers) on their main lines in place of earlier Junkers models. A new Dornier Do 26 four-engined flying boat was flight tested and put into service on the South Atlantic run. The huge field at Tempelhof, undoubtedly the world's most magnificent air terminal, continued to be enlarged and improved under an extensive governmental works program.

Domestic Transport. The air lines within the

United States once more flew more miles and handled more passenger and mail traffic than all the rest of the world combined. Continuing the efforts begun after a series of bad accidents during the winter of 1936-37 the lines drove on to new levels of safety. For the year 1938 the safety-index rose to 22,445,019 passenger-miles per passenger fatality compared with an over-all figure for 1937 of 11,915,079.

The endeavors of the U.S. Department of Commerce to improve its nation-wide system of radio beams were being continued aggressively by the new Civil Aeronautics Authority which took office August 22. The same new Authority included a semi-independent safety board charged not only with investigating all accidents but with suggesting new safety measures as well. Partly at its instigation, the air lines met in Chicago in September and adopted an inter-line agreement whose sole purpose was to insure safer flying through winter months. Competitive schedules were relaxed to permit cruising at only 50 per cent of rated engine h.p., thus relieving strain on power plants and flying personnel. Competing air lines operating from the same airport agreed to dispatch planes under weather conditions approved by all the lines affected, thus eliminating psychological pressure upon dispatchers of individual lines to approve flights under hazardous conditions "just to beat the opposition." The lines also agreed on the free exchange of technical information concerning operations, navigation, and engineering.

Individually, each air line adopted many new safety precautions and several of them carried on extensive research activities which produced gratifying results during the year. American Airlines extended its astounding safety record to three years and more than 400,000,000 passenger miles without a fatality. United Air Lines was instrumental in developing a device (demonstrated publicly for the first time in October) which furnishes the pilot for the first time with a reading of his height not above sea level but above the actual terrain over which he is flying. A joint project of United Air Lines, Bell Telephone Laboratories, and Western Electric, the new "terrain clearance indicator" promises to become one of the most useful aids to safe air navigation developed since the radio beacon appeared during the late 1920's. Other noteworthy safety devices demonstrated during 1938 were an automatic radio compass developed by the Sperry Co., and the Radio Corporation of America; a device to give the pilot warning of an approaching wing stall developed by the National Advisory Committee of Aeronautics; a new method of studying propeller vibrations developed by the Hamilton Standard Division of the United Aircraft Corporation.

A bitter air-line rate-war threatened seriously in the early months of the year when several air lines adopted extreme measures for the stimulation of winter traffic. United Air Lines, and then almost every air line in the country, offered to carry the wife of any air-line traveler free in a drive to eliminate the "family fear" argument encountered so frequently by air-line salesmen. With more direct effect upon the general rate structure, Northwest Air Lines slashed its fares between Chicago and the Twin Cities and between Chicago and the northern Pacific coast States so severely that round-trip tariffs fell to less than two cents per passenger-mile. Western Air Express also made heavy reductions, especially in round-trip rates. United Air Lines cut its fares to the northwest to

levels which competed with the Northwest Air Lines' tariffs. T.W.A. had previously announced a winter bargain reduction of 15 per cent. For some weeks it looked as though the whole tariff structure was headed toward a revolutionary overhaul. Then the normal seasonal increase of travel toward the end of spring seemed to head off the trouble. Most of the "educational" offers were repegged at levels somewhere between the extreme lows and the normals of 1937.

Traffic as a whole gained as satisfactorily as might be expected in the face of a nation-wide business recession. Although the early summer months failed by a small margin to reach 1937 figures, the traffic totals for the first 10 months reached 397,000,000 passenger-miles compared with 355,000,000 for the corresponding period of 1937, an increase of about 12 per cent. Express pound-mileage ran slightly below 1937 levels, yet the actual number of shipments had increased and with it the income netted from such operations by the air lines.

Air mail continued to set new records for each succeeding month. An approximate estimate for the first 10 months showed a total ton-mileage of 6,150,000 ton-miles compared with 5,500,000 ton-miles for the corresponding period of 1937. One feature of the mail-traffic year was a spectacular air-mail week observed during May. Led by Postmaster-General Farley, every post office in the country displayed special posters, arranged newspaper articles, public speakers' programs, school essay contests, etc.—all in observance of the twentieth anniversary of the opening of the country's air-mail service.

Another important air-mail mile-stone was passed during April when Congress enacted the Experimental Air Mail Act. By its terms the Post Office was able late in the summer to call for bids on a unique mail route between Baltimore and West Virginia in which the mail plane called at numerous small towns, picked up sacks of air mail, and dropped others—all without landing. In November the Post Office also asked for bids on a shuttle service between the Camden airport and the roof of Philadelphia's new post-office building to be carried out by autogiro, thus attacking the important problem of expediting air-mail service in large cities whose airports lie in remote suburbs. Also on the post-office docket for approaching months were the establishment of some five very short air-mail routes, with stops at every possible town, in the Rocky Mountain region.

But the most fundamental development in domestic American air transport derived from the passage by Congress of an act creating a new Civil Aeronautics Authority to control all phases of this country's non-military flying. By its terms, the regulatory functions heretofore carried out by the Bureau of Air Commerce within the Department of Commerce, the Post Office, and the Interstate Commerce Commission were transferred to a new independent body. It had some resemblance to quasi-judicial commissions previously existing in other fields, but with the difference that in addition to a commission of five men headed by a chairman, whose functions would be largely quasi-judicial, there was appointed an administrator whose duty it would be to carry out the regulations which the Authority would pass and to maintain and construct Federal aids to air navigation. Also separate from the Authority itself was the safety board of three members, mentioned above.

To this new Authority was assigned not only that control over civil aviation which derives from

the issuance of certificates to pilots, ground personnel, and aircraft, but a complete control of air-line economics. Thenceforth, the establishment of an air line may only be carried out after the Authority has granted a certificate of public convenience and necessity (air lines already operating when the act was passed were to be automatically issued such certificates substantially equivalent to continuing franchises). Thereafter it lay within the Authority's power to determine (indirectly) what each line might charge for passengers and express and what payments should be made to each contractor by the Post Office for the transport of mail (although the Post Office retains control of the designation of which routes should carry mail and at what frequency). The new Authority was also given control over air-line issuance of financial obligations, the power to forbid the discontinuance of an air line, and the permission to veto any air-line merger or pooling agreement it considered against the public interest.

Airports. The steady increase in airplane traffic and in the use of large high-performance equipment and the near prospect of blind landing operations made the air-terminal problem a critical one in many large American cities. Fortunately, the WPA continued to expend large sums on airport projects. On December 3 a résumé of such work showed that of 191 regular air-line ports-of-call in the United States, 169 had been improved through relief funds. However, the questions of maintenance and acquisition of additional land had become so burdensome to many cities that an increasing sentiment was making itself felt in Washington for Federal participation in such expenditures, along the lines of the Federal assistance to state highway departments. As a result the Act creating the new Civil Aeronautics Authority specifically directed that body to survey the problem and submit its recommendations to Congress by Feb. 1, 1939.

Meanwhile, several long squabbles having to do with major air terminals were finally resolved during the year. The question of a site for Washington's air terminal was settled in November when Army dredges began pumping earth fill into a site at Gravelly Point, 2 miles down the Potomac from the present Washington-Hoover airport but still within a 10-minute drive of the city's business district. A joint project of the WPA, the Army Engineers, and the Civil Aeronautics Authority, the new field is to be opened for traffic in 1940. In addition to a system of long runways, big hangars, and a pretentious administration building, the new field is to have buildings ample to house the big personnel of the Aeronautics Authority. New York City, which for more than a decade has resented the fact that its air travelers must use the Newark Municipal Airport, moved swiftly toward completion of a big land and marine air terminal at North Beach, on the northern shore of Long Island, not far from the site of the World's Fair, scheduled to open in May, 1939. Involving the placement of a colossal amount of filling material and the construction of seven huge hangars and two administration buildings, North Beach when finished will have cost the city and the WPA something in the neighborhood of \$25,000,000. But it will be located within 25 minutes of mid-town New York via the new Triborough Bridge and will definitely move the bulk of air-line operations from Newark. By December, the country's three largest domestic operators had signed leases for hangar occupancy and Pan American Airways was negotiating for facilities to be used as a transatlantic terminal.

On the Pacific slope, San Francisco saw the completion of extensive improvements on its own Mills field and on the Oakland airport across the bay. Meanwhile, the grounds of its World's Fair, built up off Yerba Buena Island and reached by the San Francisco-Oakland Bridge, were carefully planned to serve ultimately as a combined land and marine terminal for the city. Pan American Airways had already moved its transpacific terminal to one of the Fair buildings, where Fair visitors will be able to watch maintenance operation on the big clippers through glass partitions. Several of the other Fair buildings, instead of being mere temporary structures, had been built as huge hangars which after the Fair closes can be directly converted to air-line use. Even Los Angeles, which has had a half-dozen rival candidates for designation as the city's air terminal, seemed settled at the year's end on a plan to concentrate its air-line operations at the Los Angeles Municipal Airport (Mines Field).

Individual Exploits. Although the day seems now definitely passed when individual airmen can hope to influence profoundly the development of aviation, a number of individuals did stand out during 1938 through their aeronautical achievements.

Perhaps most spectacular of all was the round-the-world flight carried out in July by Howard Hughes, the young movie producer and sportsman, who in previous years set still-extant American records for the transcontinental crossing and for landplane speed over a 3-kilometer course. On Sunday evening, July 10, Hughes, accompanied by four companions, each a specialist in some field of practical aviation, lifted his heavily loaded Lockheed 14 transport plane off Floyd Bennett Field, L. I. Flying day and night, stopping only for quick refueling at Paris, Moscow, Omsk, Yakutsk, Fairbanks, and Minneapolis, Hughes and his crew landed back at Floyd Bennett Thursday afternoon after an absence of only 91 hours, 8 minutes. The triumph, as Hughes himself was first to say, was one of careful preparation and organization over a period of almost three years.

Nearly as spectacular, yet almost incredibly contrasted in planning and execution, was the feat of Douglas Corrigan who, the week following Hughes' journey, slipped out of Floyd Bennett Field in a nine-year-old Curtiss Robin, equipped with large extra fuel tanks but lacking radio and all but the most rudimentary of flight instruments. Field attendants thought he was merely bound on a return flight to Los Angeles from which he had flown non-stop the preceding week. Regardless, he astounded the world by appearing in Ireland, July 18, with a very few gallons of fuel remaining in his tanks and the boldest excuse an airman ever offered for violating countless rules and regulations; he had somehow, he said, misread his compass and, being above the clouds, had had no inkling of the fact that he was not flying to California. The flight (and the story) so intrigued the public that the reception he received upon his return to America was the most elaborate since that accorded Lindbergh in 1927. Officials meted out only the most nominal of punishments.

A third outstanding American flight was that started from San Diego, June 2, by Richard Archbold, young scientist on the staff of the American Museum of Natural History. With a Consolidated flying boat similar to the standard patrol bomber of the American Navy, Archbold and his crew flew non-stop to Honolulu. June 7 they crossed directly to Wake Island, omitting the call at Midway,

scheduled by Pan American transpacific clippers. On June 9 they pioneered a 2300-mile crossing to the North Coast of Dutch Guinea. A few weeks later Archbold put his ship in service on a long two-year program of exploration of the remote mountainous interior of that island, now one of the few remaining areas in the world which is still occupied by tribes with a pure Stone-Age culture.

Another American flight, less individualistic in tone yet none the less of great significance, was a "Good-will" flight of six big "flying fortress" Boeing bombers of the U.S. Army Air Corps to Argentine and return. At 12:55 a.m., February 17, Lieut. Col. Robert Olds led the squadron off the Miami, Fla., Municipal Airport. At 4:30 p.m. the same day they landed at Lima, Peru, 2695 miles away. After a six-hour stop for refueling, five of the squadron flew southward to Santiago, Chile, then swung eastward to land at Buenos Aires at 11:10 the following morning. The sixth plane, held at Lima by minor mechanical trouble, cut directly southeastward to arrive soon after the rest of the squadron. The return trip, with three stops, was carried out late in February without incident. Twenty-five officers and 24 enlisted men took part in the expedition.

In Europe, the airmen of Great Britain, France, Germany, Italy, and Russia were active in posting new records in the many categories recognized as official by the Fédération Aéronautique Internationale. Most of their record breaking was naturally done on aircraft produced under government contract for national air forces or for air lines closely associated with national governments. Consequently their feats are personal only in a minor degree.

Three flights stood out:

October 7 the pick-a-back combination of *Mercury* and *Maia* took off from Dundee, Scotland, and uncoupled. Two days later the *Mercury*, again with Capt. D. C. T. Bennett at the controls, landed on Alexander Bay, Orange River, South Africa, 6045 miles away. That set a new international record for seaplanes.

On November 8 three single-engined Vickers "Wellesley" bombers took off from Ismailia, Egypt, swung southwestward across Arabia, India, and the Dutch East Indies. One of the three paused briefly at Koepang, 6600 miles from the point of take-off. The other two landed at Port Darwin, Australia, their preannounced goal, 7162 miles from Ismailia. Thus all three broke the former mark of 6306 miles set during 1937 by the Russians on a transpolar flight to California. Squadron leader R. Kellett, RAF, was in command of the squadron during the flight.

In October Lieut. Col Mario Pezzi of the Italian Air Force climbed to an altitude above the Guadonia airport near Rome of 56,000 ft., thus eclipsing the record set in 1937 by the late Squadron Leader Adams of the RAF. Of technological interest was the fact that his single-engined Caproni biplane was equipped with a supercharged cockpit enclosure, the first ever used for such a record attempt.

Women fliers seemed less active in record-breaking attempts than formerly. Outstanding feminine achievement of the year was the winning of the Bendix transcontinental speed race, September 2, by Miss Jacqueline Cochran, flying a single-seater Seversky monoplane, similar to the newest pursuits in service squadrons of the U.S. Army Air Corps. Flashing ahead of a field of nine other entrants, she was forced to fly at altitudes between

16,000 and 22,000 feet to cross above a wide area of bad weather and reached Cleveland after an elapsed time of 8 hours, 10 minutes, 31 seconds, slightly over the record, but still excellent time. After a quick refueling she pushed on to Floyd Bennett Field, L. I., to set a new woman's transcontinental mark of 10 hours, 12 minutes, and 55 seconds.

Private-Owner Airplanes. The manufacture of airplanes for non-transport non-military users remained at approximately the same numerical total as that reached in 1937—about 1500, although the trend toward small planes (selling between \$1250 and \$2000) resulted in a substantial decrease in the total dollar value of this class of airplane production. Toward the year's end, proponents of non-scheduled flying for business and of flying for sport's sake were considerably heartened by the action of the Civil Aeronautics Authority in creating a separate division charged with its general encouragement and support. Even more encouraging was talk in Washington that the United States might finally agree to some plan of subsidizing private flight training as part of a new air-defense program.

Throughout the year American pilots carried out numerous novel flights to demonstrate the utility of the modern 50-h.p. "fivver" plane. In May, during Air Mail Week, one Piper Cub was flown non-stop from Miami to New York and return, refuelings being effected at several points by hauling gasoline in cans from automobiles traveling along beneath the plane. During that same week, literally hundreds of planes of this and larger non-transport types were used in special feeder-line demonstrations to stimulate air-mail interest in some 1100 towns off the regular air-line network. In September another Piper Cub was kept aloft (with automobile refueling) for 103 hours over Syracuse, N. Y. In November a crew kept still another Cub in the air over Southern California for 218 hours, 23 minutes, pilots actually being changed during flight via a rope ladder.

Far more significant than any of these refueling projects was the flight early in December of one Johnny Jones from Los Angeles Municipal Airport to Roosevelt Field, L. I., non-stop flight without refueling of 2785 miles. The plane used was an Aeronca powered with a 50-h.p. Continental engine and fitted with extra tanks to give a total fuel capacity of some 148 gallons. Jones, an ex-vaudeville dancer turned airplane salesman, told reporters he had made his flight "to show you don't need a million dollars to fly, just a third down and easy payments." The total cost of his transcontinental trip was only \$24.75.

Military Aviation. As never before military air armaments played a part in the world's affairs. Active aerial warfare continued in Spain and China, featured by extensive use with ground troops and the continued bombing of open cities as well as of purely military objectives. Later in the year the Royal Air Force was also called into action in Palestine, where the British were encountering great difficulties with the Arabs.

But it was the terrifying potentialities of air power in a war between the powers of Western Europe which really brought the question of air armaments to a new prominence. This is hardly the place for an analysis of the many complex factors which led to and determined the character of the pact signed at Munich, but there is little doubt that the air squadrons built up during the past half-decade by the Axial Powers played a large

part among them. Estimates of the air strength of the nations involved were as different as they were numerous. But a consensus of the more conservative analyses would fix the "first-line" strength of Germany and Italy combined at at least 6500 modern planes of full effectiveness in major warfare. Against these England could have put about 3000 similar planes into the air, France another 1500, Czecho-Slovakia and Rumania a few hundreds at most. Russia remained an almost unknown factor, although it seemed certain that the majority of planes she does possess could not measure up to the quality of the better planes of the Western European Powers.

In any case, Prime Minister Chamberlain's "peace in our time" was evidently coupled with no dream in his mind that Britain could afford to slow up her rearmament program. Far from it. At the end of the year Parliament had acceded to a budget for the RAF for the fiscal year of 1939 of no less than \$1,000,000,000, compared to some \$600,000,000 expended during 1938. France, while still bitterly struggling with its labor problem, was preparing to speed the immediate production of an additional 3000 "first-line" military planes by the end of next year. The largest press ever built, for fabrication of sheet-metal parts, was completed in an American factory and shipped to France for use in aircraft manufacture. The Axial Powers were continuing the smooth flow of quantity production.

By November the scramble by each nation to provide itself with an air force "equal to any possible combination of air forces that might be brought against it" had spread to the United States. Here Assistant Secretary of War Louis Johnson, speaking with apparent White House approval, talked of putting the American aeronautical industry upon a mass-production basis immediately, and of building up the Army Air Corps from a current strength of about 1500 planes to some 9000, the Navy meanwhile presumably building up to its currently allotted 3000. Political observers were not in complete agreement as to whether the Congress, due to assemble Jan. 3, 1939, would underwrite the huge expenses of such a program. But it did seem certain that America would in 1939 very much accelerate its military and naval air program.

Airplane Design. Trends in landplane transport throughout the world were definitely toward the big four-engined carrier accommodating from 30 to 40 passengers. In Germany such planes built by Junkers and Focke-Wulf actually entered service on Lufthansa's European routes. In England Imperial Airways took delivery of the first models of fleets of huge Armstrong-Whitworth "Ensigns" and De Havilland Albatrosses. In the United States the giant 40-passenger Douglas DC-4 transport made its first test flight in June, was tested at gross weights up to 65,000 lb., and was due for delivery to United Air Lines for first service test in January. The first 32-passenger Boeing 307 was also nearing completion.

Of equal interest with the question of air-transport size was that of the advisability of pushing long-range transport operations up into "stratosphere" levels between 20,000 and 25,000 feet. As has been mentioned earlier, Pan American Airways was to take delivery early in 1939 of three four-engined Boeing landplanes equipped with superchargers to keep cabin pressures and oxygen-content equivalent to those prevailing at 6000-8000-foot levels. An even more positive indication of progress in this direction was the publicity given

to a year of high-level research finished in 1938 by the U.S. Army Air Corps upon a specially super-charged Lockheed transport. So successful was this work in producing solutions for the numerous mechanical problems involved that the Collier Trophy "for the most important contribution to American aviation demonstrated during the previous year" was awarded to the U.S. Army Air Corps for the period of 1937.

Perhaps the most progressive airplane design to appear during the year was that of the twin-engined pusher combat fighter delivered to the U.S. Army Air Corps by the Bell Aircraft Co. of Buffalo, N. Y. Armed with two rapid-fire cannon and several machine guns and capable of speeds to match the best pursuits, this new plane promised to revolutionize concepts of aerial defense against bomber attack. Also of considerable significance was the world-wide renewal of interest in rotary-wing aircraft of all types. Germany and Italy had successful helicopters flying throughout the year. Both America and England produced "gyroplanes," modifications of the autogiro. Military authorities, led by the U.S. Army Air Corps, undertook tests of the autogiro as a substitute for captive balloons in artillery spotting. In the closing minutes of its 1938 session the U.S. Congress authorized, but did not appropriate for, a proposed \$2,000,000 program of rotary-wing experimentation.

AFGHANISTAN, āf-gān'ī-stān; -stān'. A central Asian monarchy, bounded by the U.S.S.R., Iran, and India. Area (estimated), 245,000 square miles; population (latest estimate), 12,000,000. Chief towns: Kabul (capital), 80,000 inhabitants; Kandahar, 60,000; Herat, 30,000; Mazar-i-Sharif, 20,000. Persian and Pashto are the main languages spoken. Islam is the predominant religion. Free elementary and secondary schools exist throughout the country; for higher education there are various technical, art, commercial, and medical schools, and Kabul University.

Production and Trade. Cereals, fruits, and vegetables are grown in the irrigated plains and valleys. Castor-oil, madder, and asafetida plants are plentiful. The Afghanistan fat-tailed sheep furnish the main meat food, the grease from the tails being used as a butter substitute, while the wool and skins are used for wearing apparel. In 1936 it was estimated that 6800 metric tons of wool were produced. Copper, lead, iron, crude oil, lapis lazuli, and gold are the chief mineral products. Kabul contains factories, owned and supervised by the state, for making buttons, matches, leather, and boots; a factory for making arms, ammunition, and clothing for the army; and a mint.

The chief imports are cotton goods, sugar, dyes, hardware, leather, and silver treasure; exports consist mainly of lamb skins, timber, fruits, skins, and raw wool. Trade is mainly with the U.S.S.R., India, and Iran. The chief routes to India are from Kabul through the Khyber Pass to Peshawar and from Kandahar to the railway terminal at Chaman in Baluchistan. Goods are transported mainly by camels and pack-horses but certain roads are used by automobiles during dry weather. In 1937 there were 1561 miles of roads. There are telephone systems in the larger towns, telegraphic communications linking Kabul and Kandahar with Peshawar and Chaman, and a wireless station able to communicate with India and Eastern Europe.

Government. The budget for 1937-38 was estimated to balance at 150,000,000 Afghan rupees. Afghanistan is a constitutional monarchy, with legislative power vested in a parliament comprising

the King, a senate of 40 members appointed by the King for life, and a national assembly of 120 elected members. King, Mohammed Zahir Shah (succeeded, Nov. 8, 1933).

History. A revolt against Mohammed Zahir Shah's regime was organized during 1938 among the warlike tribes of Waziristan on the Indian side of the Afghan-Indian frontier by a Syrian Mohammedan priest named Sayid Mohammed Sadi. The priest was related to the father-in-law of the deposed King Amanullah of Afghanistan, then in exile in Rome, and was believed to be acting on Amanullah's behalf. He preached a holy war against the reigning Afghan dynasty and on June 20 crossed the border into Afghanistan with some hundreds of armed followers. His force was several times dispersed by Afghan troops and airplanes, but reassembled and gave the Afghan military authorities much trouble before it was finally crushed in a battle in the Gomal valley near Jalalabad on June 24. The rebel forces at this battle totaled about 2000 tribesmen. The priest, known also as the Shami Pir, soon afterward surrendered to the British military authorities in the Northwest Frontier Province of India and was repatriated to Syria. Peace was soon restored in Afghanistan.

A number of new military airplanes received from Italy and Great Britain early in the year aided the Afghan army in suppressing the revolt. To finance the further modernization of the army and other projects forming part of the government's westernization program, strict control of foreign exchange transactions was established in 1938 and the export of gold and silver in any form was prohibited. Pending the establishment of a State Bank, the Afghan National Bank was placed in control of exchange transactions. The government's hope of revenues from newly explored oil deposits were dashed in June when the Inland Exploration Co., owned by the Seaboard Oil Co. and other United States interests, surrendered the oil concession obtained early in 1937. The company reported that its explorations indicated "excellent oil possibilities" but that world conditions made their exploitation inadvisable.

A protocol extending for another 10 years the treaty of friendship and non-aggression signed by Turkey and Afghanistan in 1928 was ratified by the Turkish National Assembly on June 23, 1938.

AFRICA. See the articles on the respective countries and territories, including EGYPT; ITALIAN EAST AFRICA; KENYA; MOROCCO; SOUTH AFRICA, UNION OF; TUNISIA; ETC.

AGNES SCOTT COLLEGE. An institution for the higher education of women in Decatur (Atlanta), Georgia. Founded in 1889. The enrollment for 1938-39 is 500. The faculty number 52 and the administrative staff 16 members. The endowment is \$1,637,000, and the gross income for the session 1937-38 was \$351,000. There are 34,250 volumes in the library. President, James Ross McCain.

AGRICULTURAL ADJUSTMENT ACT (AAA). See UNITED STATES under *Administration and Congress*; AGRICULTURE; BUSINESS REVIEW.

AGRICULTURAL EXPERIMENT STATIONS. Prominent developments in the American experiment station system during 1938 included expanding activities, with increased funds and facilities, and extension and strengthening of co-operative relations of the stations with the U.S. Department of Agriculture and with other agencies interested in agricultural research. There

was greater stabilization and adjustment of research projects and programs making for more efficient use of funds, facilities, and personnel in solving fundamental and long-time problems of wide common interest as well as special problems of more immediate regional or local concern.

The research programs of the experiment stations included approximately 8500 research projects embracing a wide range of agricultural and rural-life problems including land use; soil and water conservation; pasture improvement; crop adjustment; economical production, distribution, marketing, and use of plant and animal products; improvement of the quality of such products; protection against animal and plant diseases, insects, and other pests; tenancy, taxation, and other matters affecting the efficiency of farm business management and the betterment of the rural home and rural life. The stations continued to work closely with other agencies, with each other in regional groups, and with the Department of Agriculture individually and in regional and national groups in efforts to plan and co-ordinate attacks on major problems.

Financial support derived from all sources for the experiment stations aggregated \$19,848,068 for the year ended June 30, 1938, compared to \$17,694,250 in 1937 and \$18,056,000 in 1931, the previous high. Of the total, the United States Government provided \$6,232,500 which included, under the Hatch, Adams, and Purnell Acts, \$90,000 for each State, \$22,500 for Alaska, \$50,000 for Hawaii, and \$40,000 for Puerto Rico. The \$1,800,000 provided under the Bankhead-Jones Act of 1935 was allotted on the basis of rural population. An increment of \$300,000 was to bring the Bankhead-Jones fund total in 1938-39 to \$2,100,000. The research projects included 505 supported with Adams funds, 695 with Bankhead-Jones funds, and 1660 with Purnell funds. Merger of the Federal and Territorial stations in Hawaii was completed during the year, the institution also receiving \$2066 as final direct Federal appropriations, \$81,620 from Territorial and other funds, and it conducted research under sugar processing tax fund allotments amounting to \$79,906. The Puerto Rico College Station at Rio Piedras received \$36,414 of Bankhead-Jones funds and \$140,977 from the Insular government and other sources. The work in Puerto Rico was supplemented by the Federal station at Mayaguez, which increased its service as an outpost of the Department in the Tropics and also made important contributions to the improvement of agriculture in the island.

Gifts and bequests of land and funds for agricultural research were made to several stations. The Maryland University and Station received from Charles E. McManus, farm properties about 18 miles north of Baltimore and valued at more than \$1,000,000, a herd of Ayrshire cattle, other livestock, and over 100,000 chickens. The property or proceeds therefrom were to be used solely for the benefit of agriculture. A trust endowment of \$500,000 for agricultural and chemurgic research was made to the Michigan station by the Horace H. Rackham and Mary A. Rackham Foundation of Detroit, the income to be used for developing new uses for farm products. Income from a gift of \$50,000, known as the Henry Strong Denison Fund for Agricultural Research, was being administered by Cornell University. The Iowa State College Agricultural Foundation, established with broad objectives in agricultural research, received a gift of nine farms with funds for maintenance.

Funds for the Gurine Gulsteen Research Fellowship for farm problems at the Wisconsin University and Station were derived from sale of a farm.

Regional research laboratories, established 1936-38 in major agricultural regions under provisions of the Bankhead-Jones Act of 1935, had begun to function in co-operation with the State experiment stations as important research centers in their special fields and several already had attained a considerable degree of success. The laboratory for vegetable breeding was located at Charleston, S. C., with B. L. Wade as director; for soybean research at Urbana, Ill., O. E. May; grass breeding and pasture research, State College, Pa., R. J. Garber; animal and poultry diseases, Auburn, Ala., B. T. Simms; swine breeding, Ames, Iowa, W. A. Craft; sheep breeding, Du Bois, Idaho, J. E. Nordby; poultry research, East Lansing, Mich., J. H. Martin; and salinity problems, Riverside, Calif., O. C. Magistad, director. Representatives of the Department and of the stations collaborated with these directors in formulating research programs, which were designed to supplement and integrate the work of the States and the Department, especially in basic aspects of the problems as applied to the region as a whole.

Four additional regional research laboratories for new and wider industrial outlets and markets for agricultural commodities, authorized by the Agricultural Act of 1938 with expenditures limited to \$4,000,000 in the fiscal year 1938-39, were, the Secretary of Agriculture announced Dec. 14, 1938, to be located at, and to study designated commodities and by-products with directors as follows: The Southern Laboratory, New Orleans, La., cotton, sweet potatoes, and peanuts, D. F. J. Lynch, director; Eastern Laboratory, Philadelphia area, tobacco, milk products, apples, potatoes, and vegetables, P. A. Wells, director; Northern Laboratory, Peoria, Ill., corn, wheat, and agricultural wastes, O. E. May, director; and Western Laboratory, San Francisco Bay area, wheat, potatoes, alfalfa, fruits other than apples and vegetables, T. L. Swenson, director. The programs being developed for these laboratories were based largely on surveys of current uses, of related research in progress in the State experiment stations and other agencies, and suggestions from many scientists and industrial leaders in the four areas. Plans for buildings to house the laboratories were under way and construction would begin before June 30, 1939.

The administrative and technical advisory functions of the Office of Experiment Stations were enlarged and extended during 1938 by administration of additional research funds made available both to the stations and the Department through the Bankhead-Jones Act of June 29, 1935 (see 1935 YEAR BOOK, p. 11), particularly in connection with establishment of regional laboratories and development of special research projects. Dr. J. T. Jardine, chief of the office, continued to serve as director of research of the Department with enlarged responsibilities under the Bankhead-Jones Act, the Agricultural Adjustment Act of 1938, and other legislation pertaining to the Department's research program. R. W. Trullinger was appointed assistant chief of the office on Aug. 1, 1938. *Experiment Station Record* issued by the office completed its 79th volume.

The improvement of facilities for research and station equipment was noteworthy. The building program of Maryland University and Station, involving \$2,380,341 and begun during the year, included \$1,219,263 for use at College Park, com-

prising \$125,360 for a poultry building and plant, \$114,360 for a home economics building, \$37,000 for greenhouses, and \$15,730 for remodeling the dairy building. The \$5,000,000 building program of the Pennsylvania College and Station included new buildings for agricultural science, agricultural engineering, and forestry. The new forestry building being completed at the Minnesota station at a cost of \$250,000 provided space for the division of forestry and for the Lake States Forest Experiment Station. The Indiana Station was building a new three-story agricultural-chemistry laboratory and an addition to its horticultural building. The new \$600,000 physical science building being built at Kansas College and Station provided facilities for station research in chemistry and physics. Louisiana State University completed the farm center, an elaborate pavilion providing laboratories and offices for several station departments and co-operating divisions of the Department of Agriculture. Improvement of land and buildings acquired in 1935 provided permanent quarters and facilities for a number of departments of the New Jersey Station. Laboratories were built for cotton research at the Alabama station and wool studies at the Montana station, and greenhouses for various lines of investigation were erected at the Georgia Coastal Plain, Kansas, North Carolina, and South Carolina Stations. Construction began in August on a \$4,200,000 improvement program at the National Research Center, Beltsville, Md., the first phase comprising three new general-purpose laboratories and one for cold storage. The program also included construction of new barns, improvements to roads and fences, and installation of new facilities at the Patuxent game research refuge.

A livestock and forestry branch station, being developed by the Arkansas Station on 3000 acres near Batesville, was established to develop a farming system adapted to problem land in the eastern Ozark section. A gift of 100 acres of rich delta land near Clarksville, Ark., was to be operated as a substation for cotton and corn breeding and related crops. The New Mexico Station began research with crops grown under irrigation on its new substation near Albuquerque. A tree-fruit substation was being located on a 45-acre orchard tract near Wenatchee, Washington. A tract of about 37 acres in the Tongass National Forest near Petersburg was conveyed to the University of Alaska for use as a fur-farm experiment station. The 237 acres of land acquired by the Louisiana Station 4 miles east of the campus was to be used as a site for the experimental poultry plant and crops and soils research. A gift of 100 acres at Winters was being equipped by the California Station for horticultural experiments. The South Carolina Truck substation acquired 200 acres of land, partly for field experiments.

The Colorado, Connecticut Storrs, Georgia, Illinois, Maryland, New York Cornell, Oregon, South Carolina, and West Virginia Stations celebrated their fiftieth anniversaries during the year, several with elaborate ceremonies.

AGRICULTURAL EXTENSION WORK.

Founded on the philosophy that the utility value of knowledge is the best evidence of its worth, agricultural extension work, with its practical farm and home demonstrations, is gradually substituting modern, successful methods of farming and homemaking for antiquated methods. Many forces at work during recent years have demonstrated the soundness and importance of extension work. The far-reaching social and economic changes, national and international, the perplexing problems that farmers are facing, the immense farmer-aid programs, such as those promoting agricultural adjustment, soil conservation, farm ownership, and the like, which have required more intensive individual and group action by farm people, and the confidence that rural people have in extension work have contributed materially toward its development and enabled it to occupy an increasingly larger and more significant place in rural-life improvement.

In 1938 the scope of extension work continued to broaden and extension workers found themselves involved in a larger number of activities which vitally affect the rural welfare than at any time previously. Marked progress was made in every phase of educational work with rural people, particularly in those major lines which are so intimately connected with the improvement of farm business and production methods through practical readjustments in agricultural planning, with land utilization, soil conservation, crop and livestock improvement, poultry flock management, market grading practices, weed, insect, and plant disease-control methods, and constructive development of homemaking and a more satisfying family life.

Agricultural planning with special emphasis on land-use was developed during the year as one of the major activities of the co-operative extension service. Although land-use planning has been a part of the extension program for a number of years, it was considerably broadened, accelerated, and systematized following a conference on July 8, 1938, between representatives of the U.S. Department of Agriculture and the Association of Land-Grant Colleges and Universities. As a result of this conference, the Department and the land-grant colleges agreed to co-operate in establishing democratic and co-operative procedures that would enable farm people to have an effective voice in formulating, correlating, and localizing public agricultural programs. Following this agreement the co-operative extension service was called upon to take the initiative in bringing about the development of long-time land-use plans and programs in co-operation with farm people. County agents were urged to intensify their efforts to build comprehensive programs for rural improvement and in so doing to develop enough uniformity of procedure to permit correlation of community plans on a county basis, then on a State basis, and finally on a national basis, thus providing guidance not only for adequate county and State land-use programs but for a national program as well.

Extension workers were quick to co-ordinate their planning efforts and to assume leadership in organizing and stimulating activities designed to provide basic information upon which to build the land-use plans. More than 2200 county agricultural

planning committees, organized by county agents and composed largely of leading farm people, functioned during the year. They started on the job of analyzing local problems in their relation to national problems and of drawing up long-time plans designed to maintain the best possible condition of the land as well as the economic and social status of the farm population.

Protection of the soil from which he earns his income and protection of the income which he earns from the soil were still twin problems of vital concern to the farm family. The agricultural adjustment act of 1938 was designed as a part of the Nation's effort to meet these problems. In thousands of county and community meetings, news articles, radio talks, and through personal contacts, extension workers explained the provisions of the new Act and helped farmers to understand the program. County agents spent fully one-fourth of their time in helping farmers to get the most out of these programs, although more of the detailed work of local administration was assumed by the farmers themselves. See AGRICULTURE.

In addition to conducting educational work designed to aid farmers in understanding and taking full advantage of the agricultural adjustment program, county agents devoted considerable time to explaining rural-improvement action programs of other Federal agencies. These included the Soil Conservation Service and the Farm Security Administration of the U.S. Department of Agriculture, the Rural Electrification Administration, the Tennessee Valley Authority, the Farm Credit Administration, and the Federal Housing Administration. Agents made considerable progress in coordinating on a county basis the programs of these and other Federal and State agencies organized to serve agriculture with the efforts of farmers in order to obtain the maximum values and benefits for agriculture.

In addition to farmer interest in these newer programs, low farm prices, larger surpluses, and increased costs of distribution caused farmers to seek the aid of agents in solving other economic problems. County agents, for instance, sponsored field meetings, marketing schools, market tours, surveys and analyses, exhibits, and work with boys' and girls' 4-H clubs to supply guidance in the use of marketing facilities and outlets. Farm people were helped to market farm produce valued at more than \$640,000,000, largely through co-operative associations and similar groups. Other types of marketing aid provided by the agents concerned inspection and grading, storage and warehousing, market outlets, distribution costs, the effect of trucking on marketing methods, and the economic basis and necessity for marketing agreements.

An aggressive effort was made to teach farmers the principles of sound credit and sound financing and to provide them with information upon which to base their decisions in the wise use of credit. One of the important economic extension activities concerned the agricultural outlook, which is designed to currently assemble and make available to farmers economic information needed in order to make possible intelligent adjustments to probable future conditions.

Vigilance was exercised against insect pests in all sections of the country. Agents helped farmers to fight grasshoppers and chinch bugs in the West, screw worms and boll weevils in the South, Japanese beetles in the East, and many other insects equally dangerous to farm crops and livestock. Comparable attention was given to combating dis-

eases affecting livestock and crops. To avoid losses from smuts and other seed-borne diseases, for instance, as well as to prevent widespread distribution of disease-producing organisms, agents encouraged the chemical treatment of emergency seed stocks.

In support of renewed interest in proper land-use, extension workers co-operated closely with the Agricultural Adjustment Administration and the Soil Conservation Service in building and fostering programs designed to combat the ravages of wind and water on the soil. Such measures as strip cropping, terracing, contour tillage, and the use of seasonal cover crops were taught to farmers by the agents. Farm woodlands were improved through demonstrations in selection-cutting of trees, pruning, timber estimating, prevention of forest fires, and similar improved practices.

Contributions to better farming were made by the extension program in agricultural engineering. Farmers were aided in improving their dwellings and making them more convenient, comfortable, healthful, safe, and beautiful. Plans for economical new and remodeled dwellings and for service buildings to house livestock and store farm produce were provided farmers through the extension service. Advice and training in the care and upkeep of farm machinery and in the economical installation and use of electrical facilities were two of many other engineering phases on which agents taught better practices.

The production of more home-grown feeds, establishment of permanent pastures, and herd improvement were major objectives of extension work in dairying. Artificial insemination commanded increased attention in major dairy counties in some States, where plans were made to give it a prominent place in next year's breeding program. Extension efforts directed toward poultry improvement centered around the growing of healthier chicks, the production and marketing of high-quality eggs, brooding for pullet development, and better poultry housing. To supply an increased need for information on methods of curing and using meat, agents showed farmers how to identify, select, and utilize meat according to quality and cut, and explained the place of meat in the family diet.

Better family living on the farm through a planned food supply produced from the farm was a major part of home demonstration work in 1938. This activity had two objectives, which were to improve health and to reduce cash expenditures. Assisted by home demonstration agents and local leaders, farm women planned and planted family gardens, raised small fruits, and canned and stored supplies of fruits, vegetables, and meats, sufficient to meet the dietary needs of the family during the winter months. As a result of extension teaching more rural families served better-balanced meals than ever before. Likewise, more thought was given to advising mothers regarding the nutritional needs of their children.

One of the big undertakings of the co-operative extension service is to train rural youth through boys' and girls' 4-H club work. (4-H denotes Head, Hand, Heart, and Health.) 4-H club works designed to raise the standards of farming, homemaking, community life, and citizenship through training rural youth to be skillful in their practices of farming and homemaking, to develop co-operative action, to serve the community, to understand and appreciate art, music, literature, and nature, to adopt standards of healthful living, and to acquire proper attitudes, qualities of rural lead-

ership, and good traits of character. More than 1,200,000 boys and girls enrolled in 4-H club work in 1938 benefited from the leadership of extension workers.

The paid force employed to carry on extension activities in 3075 rural counties numbered on Dec. 31, 1938, 8680 workers. Educational work with farmers and farm boys was carried on by 2934 county agricultural agents, 885 assistant agents, and 255 Negro agents. Farm women and girls were helped to solve their problems by 1779 home demonstration agents, 137 assistant agents, and 209 Negro agents. Eleven urban agents were employed to work with women in villages and towns. In addition to these agents in the counties, many of whom gave part of their time to boys and girls in 4-H clubs, there were also 222 county club agents, 53 assistant agents, and 3 Negro agents who devoted full time to 4-H club work. State extension specialists who were recognized authorities on various phases of agricultural and home-economics subject matter numbered 1570. The administrative and supervisory staff consisted of 622 State extension directors, assistant directors, and State, assistant State, and district leaders. About a half million extension-trained farm men, women, and older boys and girls served as unpaid local leaders and helped extension agents in organizing and advancing their local programs.

The expense of carrying on agricultural extension work in the States and Territories is shared by the National Government, the States, the Territories, and the counties that participate in the work. During the fiscal year which ended on June 30, 1938, the co-operative cost was approximately \$31,500,000. Of the total funds allotted, \$18,000,000 was provided by the Federal Government and \$13,500,000 came from sources within the States and Territories.

AGRICULTURE. Agriculture and its problems continued in 1938 to hold an important place in the affairs of the nation. Cash farm income, including Governmental payments, was nearly \$1,000,000,000 smaller than in 1937, reflecting marked decline in industrial activity, lower levels of income of urban consumers, and the lowest prices for farm products during several years. Improved and generally favorable weather conditions with abundant rainfall were followed by bountiful harvests. There were plentiful supplies of grain and feed for livestock and a reduced but still burdensome cotton crop. Significant trends operating during the year included practically no gain in farm real estate values, a slight decline in farm mortgage debt which had constituted an increasing proportion of the farm values, lessened demand for farm mortgage financing of emergency character and less delinquency in payments, decline in farm own-

ership by farmers, increase in farm taxes, adequate credit, lower volume of outstanding short-term loans, reduced interest charges, a slight gain in farm population, lower farm wage rates, and rising costs for farm machinery but decline in costs of building materials and fertilizers. Exports of agricultural products were rising in response to increased American production, shortage in foreign grain supplies, and reduction in foreign trade barriers under the trade agreement program of the United States. Imports, especially of competitive products, decreased because of the abundant harvests and decline of industrial activity in the United States. The demand for farm products was expected to be somewhat more favorable in 1939 than in 1938, with considerable improvement in domestic conditions offsetting less favorable foreign prospects. The Agricultural Adjustment Act of 1938 contained provisions expected to help the American farmer, including continuation of the Soil Conservation program, stabilization of supplies of cotton, wheat, corn, tobacco, and rice; adjustments in freight rates, new uses and markets; disposition of surpluses; consumer safeguards; marketing quotas; and Federal crop insurance. The programs to rehabilitate needy farmers and adjust their debts, to assist tenants and share croppers to buy farms, and to aid farmers in distress also were continued. Many of these and other significant current trends and problems of American agriculture have been discussed in detail on the following pages. See UNITED STATES under *Congress*; BUSINESS REVIEW; CHEMISTRY, INDUSTRIAL.

Agricultural Situation. Farm Income. The year 1938 was characterized by the U.S. Department of Agriculture as another year of bountiful harvests. The nation's granaries were full to overflowing, the feed supply for production of meat and other livestock products was about the largest in 12 years, and the supply of fibers for industrial manufacture neared the largest on record. Cash income from farm products marketed in 1938 and from Government payments was expected in December to total about \$7,632,000,000, a decline of 11 per cent from \$8,574,000,000 in 1937, attributed to an estimated drop of 18 per cent in receipts from crops, especially grains, fruits, and vegetables, and of 9 per cent from sales of livestock and their products. The 1938 income also compared with \$7,944,000,000 received in 1936, the low of \$4,328,000,000 in 1932, and \$10,479,000,000 in 1929. The reduction in 1938 farm income was held largely due to the marked decline in industrial activity during the year and lower level of income of urban consumers. Prices of farm products were forced down to the lowest figures in several years, but farmers maintained their production plant at about 1937 levels and near the average of the preceding decade. The cash income from all crops, \$3,160,000,000, included grains \$843,000,000, cotton and cottonseed \$667,000,000, fruits and vegetables \$906,000,000, and tobacco \$294,000,000; and from all livestock and livestock products \$3,990,000,000 included meat animals \$1,893,000,000, dairy products \$1,430,000,000, and poultry and eggs \$569,000,000. Gross farm income in 1938, which included cash income from farm marketings \$7,150,000,000, Government payments to farmers \$482,000,000, and the value of goods consumed by the farm family, \$1,250,000,000, would approximate \$8,882,000,000 compared with \$10,003,000,000 in 1937 and \$5,284,000,000 in 1932.

Farm Real Estate. For the first year since 1933, values of farm real estate for the United States as a whole failed to rise. In the year ended

Mar. 1, 1938, the index of average value per acre stood at 85 per cent of the 1912-14 period, the same as in 1937 and compared with 82 in 1936, 73 in 1933, 89 in 1932, and 170 at the 1920 peak. The maintenance of value levels of the year before, despite the sharp decline in farm prices, may be attributed largely to increase in cash income received by farmers in 1937. From 1933 to 1937, the values rose 4 per cent each year and by 1937 were 16 per cent above 1933. Important factors contributing to the rise in farm real estate values included increase in farm incomes, improvement in farm real estate credit conditions by both Federal and private agencies, and the substantially lower levels of farm real estate taxes in recent years. In 1937 increases in the index for the East South Central (5), West South Central (3), South Atlantic (2), Middle Atlantic (1), and East North Central States (2) were enough to offset declines reported for the West North Central (-1), Pacific (-1), New England (-1) States. The aggregate holdings of farm real estate by the five leading groups of lending agencies, the Federal land banks and Federal Farm Mortgage Corporation, life insurance companies, joint-stock land banks, insured commercial banks, and State credit agencies in the Dakotas and Minnesota, were reported at \$1,027,626,000 as of Jan. 1, 1938, about \$31,000,000 below holdings on Jan. 1, 1937. Largest holdings were by life insurance companies, amounting to \$705,207,000. Bankruptcies among farmers were reported in 1938 to have totaled 2479 during the year ended June 30, 1937, 4.5 per cent of all bankruptcies, versus 3642 in 1936, and 5917 in 1933.

Taxes. That farm real estate tax levies per acre again showed an increase in 1937, was reported during the year by the U.S. Department of Agriculture. This was the third consecutive year of an increase over the preceding year, and a survey made among tax officials and tax students in 41 States indicated that for the country as a whole levies of 1938 would average somewhat higher than those of 1937. The index for the United States, on a 1913 base, stood at 161 per cent in 1937, compared with a peak of 241 in 1929 and a low of 153 in 1934. Taxes per \$100 of farm real estate values also rose in 1937, averaging \$1.15, because land values continued on the same level as during 1936 and compared with \$1.13 in 1936 and a high of \$1.50 in 1932.

Prices. The index of prices received by farmers at local farm markets for agricultural commodities was estimated at 96 per cent of the five-year pre-war average on Dec. 15, 1938, and eight points lower than a year earlier. It remained below pre-war average after January, 1938, and was relatively stable throughout the year. With 1937 crops of record proportion moving to market during the first half of 1938, farm-product prices declined through the spring to the index of 92 in May and then rose to 96 in December, the slightly upward trend accompanying improvement in industrial payrolls and consumer incomes. Prices received for all farm products averaged 95 per cent of pre-war in 1938 versus 121 in 1937. Grain prices fell steadily in 1938 except for slight gains in September and December. Prices of cotton and cottonseed rose irregularly from the year's low in January to the high in November. Prices of fruit and of meat animals strengthened from February to July, but ended 1938 at about January levels. Dairy products opened strong, sagged to a seasonal low in June, and finished 1938 16 points below the January level. Poultry-product prices opened relatively weak, and

fell to a seasonal low in March and April but rose in December to December, 1937, levels. Compared with Dec. 15, 1937, grain prices averaged 23 points lower; meat animals, 2; fruit prices, 3; truck crops, 5; and dairy products 24; poultry and egg prices were the same as in 1937; and cotton and cottonseed were up 6 points. Average prices received by producers Dec. 15, 1938, based on reports to the U.S. Department of Agriculture, were estimated for wheat 53.6 cents per bu., corn 43.1, oats 24.4, barley 36.5, rye 32.3, flaxseed 164, soybeans 67, rice (rough) 62, potatoes 61.4, and apples 90 cents per bu., tobacco 18.1 and cotton 8.2 cents per lb., and cottonseed \$23.04 and hay \$.61 per ton. Beef cattle sold for \$6.40 per 100 lb., hogs for \$6.90, veal calves \$8.04, lambs \$7.08, and sheep \$3.69. Eggs were 27.9 cents per dozen, butter 27.4 cents per lb., and whole milk wholesaled at \$1.85 per 100 lb. Wool brought 20.2 cents per lb. and live chickens 13.6 cents. Milk cows sold for \$57.70 each, horses \$79.80, and mules \$97.70. The corn-hog ratio (number of bu. equal in value to 100 lb. of hogs) was 16 versus 15.5 in December, 1937, 9.5 in December, 1936, 16.5 in December, 1935, 6 in December, 1934, and 11.2 the five-year pre-war average. The ratio of prices received to prices paid by farmers dropped from 83 in December, 1937, to 80 in December, 1938.

Farm Labor and Production Expenses. Farm wage rates rose steadily from 80 per cent of pre-war level (\$20.41 per month with board) to 120 per cent in 1937, but in 1938 the rate dropped about 2.5 per cent. Rural living costs, as measured by prices paid for commodities used in living, were 128 per cent of pre-war in 1937, but dropped slightly more than did wage rates in 1938. The supply of labor available for farm work averaged higher in 1938 as non-farm employment increased. Replacement of farm equipment with new and improved machines has tended to reduce the number of workers on farms. This decrease has applied to family as well as hired workers. There was some decline in prices of building materials in 1938, whereas the advance begun in 1933 brought prices of farm machinery to the highest level since 1920 and automobile and truck prices also moved up. Wholesale prices of mixed fertilizers in mid-1938 averaged about 4 per cent below 1937.

Foreign Trade in Farm Products. The value of farm products exported from the United States in the year ended June 30, 1938, increased 158 million dollars or 22 per cent over values of those exported in 1936-37. Imports of commodities which competed with farm products produced in this country decreased 32 per cent in value. These changes were attributed chiefly to abundant harvests last year and the drop in industrial activity in this country, both factors operating to decrease imports of farm products. Other important factors were a shortage in foreign grain supplies and reduction of foreign trade barriers under the trade agreements program of the United States.

The exports of farm products from the United States, exclusive of forest products, rose in value to \$890,756,000 during the year ended June 30, 1938, as compared with \$732,474,000 during 1936-37, and were considerably below the 10-year (1925-35) average of \$1,279,000,000. They were larger in value in 1937-38 than in any fiscal year since 1930-31, and made up 26.5 per cent of the value of all exports versus 26.2 in 1936-37. Indexes of quantity showed that all major groups of agricultural exports were higher for 1937-38 than for 1936-37. Grains dominated with an increase in value of over

\$180,000,000 although all farm exports together increased only \$158,000,000. The grain increase, together with \$20,000,000 increase in tobacco exports, \$11,000,000 rise in fruit products, and smaller increases in other items were partly offset by a \$71,000,000 decrease in value of cotton exports. The volume index stood at 79 per cent of pre-war compared with 56 in 1936-37; 83 per cent in 1933-34; and with 136 in 1926-27. Cotton and linters, 6,251,000 (fiscal year) bales, valued at \$311,702,000, represented about 35 per cent of the agricultural export value; leaf tobacco, 443,505,000 lb., was valued at \$149,169,000; fruits and their preparations \$86,377,000; meats, including animal fats and oils, \$47,757,000; and grains and flour \$214,819,000.

Imports of farm products into the United States during the year 1937-38 were valued at \$1,155,139,000, a decrease of 25 per cent from 1935-36, which totaled \$1,536,695,000, and compared with \$614,000,000 in 1932-33, the low point of the depression. Competitive agricultural imports in 1937-38 were about \$279,000,000 less than in 1936-37, about half of the decline being attributed to commodities in the regularly imported group, including sugar, dutiable wool, hides and skins, and vegetable oils. The principal declines in that group of competitive products, imported in substantial quantities because of unusual shortages in domestic production, were in grains and feeds, particularly wheat and flour, corn and barley, and smaller reductions in other grains, egg products, and most dairy products. The agricultural imports made up about 49.6 per cent of all imports, about \$588,256,000 worth being competitive items and \$566,883,000 non-competitive.

Values of leading competitive farm products imported during 1937-38 were for sugar \$134,795,000; vegetable oils \$77,981,000; raw hides and skins \$40,516,000; wool (dutiable) \$13,612,000; corn \$24,929,000; tobacco \$32,522,000; flaxseed \$24,020,000; copra \$14,433,000; fodders and feeds \$5,628,000; nuts \$15,970,000; cheese \$11,853,000; molasses \$13,031,000; cattle (dutiable) \$11,188,000; and cotton (unmanufactured) \$9,302,000. The leading non-competitive agricultural imports in 1937-38 included rubber and similar gums valued at \$204,776,000; coffee \$133,370,000; raw silk \$87,437,000; cacao \$28,251,000; wool (for carpets, etc.) \$19,087,000; bananas \$30,230,000; tea \$19,762,000; and spices \$8,019,000.

Different aspects of and factors involved in foreign trade in farm products were discussed by Secretary of Agriculture Wallace in his Report for 1938, pp. 3-5, 18, 21, 98-100. See also *Questions and Answers about Farm Exports and Farm Imports* (1938); *Foreign Crops and Markets* 37 (1938), pp. 117-140 (Aug. 24, 1938), pp. 323-354 (Nov. 16, 1938), all U.S. Department of Agriculture.

Population. The farm population of the United States was estimated from U.S. Department of Agriculture surveys to total 31,819,000 on Jan. 1, 1938, compared with 31,729,000 one year before. The movement to farms totaled 872,000, the largest since 1933, and to the cities 1,160,000, the smallest during 17 years, except 1934, but a surplus of births over losses from causes other than migration resulted in a net gain of 90,000 persons in farm population versus a loss of 80,000 in the previous year.

Farm Outlook. Features of the agricultural situation in 1938 and indicated developments in agricultural production and marketing in 1939, concerned with demand for farm products, commodity prices, farm credit and labor, equipment and ferti-

lizer, farm family living, and the status and future of field crops for cash and feed, fruits, truck crops, nuts, livestock, poultry and their products, prepared by the U.S. Department of Agriculture in cooperation with State agencies, were summarized in *The Farm Outlook for 1939* (M.P. 333, 1938). Further details were provided in the series of *Agricultural Outlook Charts Books for 1939*, and *The Agricultural Situation* (1938), monthly (all U.S. Department of Agriculture).

Weather in 1938 and Crop Production. Weather conditions since the series of severe droughts extending through 1936 had been decidedly more favorable for agriculture, according to the U.S. Weather Bureau. The rainfall in most areas eastward from the eastern Great Plains usually sufficed for the crops and had largely restored subsoil moisture. However, in the normally drier western Plains, precipitation in 1937, much greater than in 1936, was still below normal and droughty conditions continued in a wide belt northward from the southwestern Plains. Marked improvement did not come until early in 1938, and even then the subsoil moisture was far below normal in the region.

The spring of 1938, one of the wettest on record, brought widespread frequent rainfall providing abundant water for crop needs rather generally. Wet soil in much of the interior, delayed planting of crops, particularly corn and broomcorn, and continued wet weather caused losses of oats from rust, lodging, and sprouting in the shocks in the States from Iowa and Minnesota eastward. All States had above-normal rainfall, except those in a narrow belt in the extreme South from Florida to southern New Mexico, in a limited northeastern area, and in a few localities in the far West. In Florida, however, a severe spring drought developed which damaged truck and citrus fruit. With abundant moisture late in May, the citrus groves improved rapidly. Spring frosts damaged wheat in the southwestern Winter Wheat Belt and fruit in the Central and Eastern States.

Weather conditions during spring and early summer were generally favorable for crops and especially for grass and hay. Dryness in the Dakotas in June, where subsoil moisture was still scanty, was rather unfavorable for spring wheat. Cool weather in June retarded the germination of corn. Widespread showers in the Corn Belt about July 15, however, were timely and helpful, and heavy rainfall in the Eastern States in July corrected accumulated moisture deficiencies. In fact, the heavy July rains did considerable damage to crops, to small bridges, and to roads in eastern and southern areas from New England to Texas.

Hot dry weather in August materially reduced prospects for corn in South Dakota, Nebraska, Kansas, and parts of adjoining States. However, the season was generally favorable, and late season weather was exceptionally favorable for maturing and harvesting. Heavy rainfall during July and August resulted in widespread late blight rot of potatoes in New England, New York, Pennsylvania, and Wisconsin. The hurricane of September 21 caused millions of dollars of damage to crops in New England, estimated by the Department of Agriculture at 6,514,000 lb. of tobacco lost after harvest and 150,000 bu. of onions; hundreds of acres of late potatoes destroyed by flood waters; and 4,000,000 bu. of apples—more than half the estimated production in the region—blown from the trees, which also were damaged extensively. Preliminary estimates of timber blown down indicated

tremendous destruction of the best forest trees. At the end of 1938 reports were that drought conditions in the Winter Wheat Belt had been growing progressively more serious, being most acute in Oklahoma and Kansas and in parts of Texas, Missouri, Iowa, and Nebraska; and the very dry top soil in central and western Kansas was in great danger of blowing. However, these adverse conditions were remedied early in the new year by heavy rains and snow.

Crop Production in 1938. A remarkably high average of crop yields per acre on a below-average acreage was reported by the Crop Reporting Board of the U.S. Department of Agriculture. In 1938 crop yields per acre were nearly 11 per cent above, and the aggregate acreage of the principal (47) crops harvested, 341,846,000 acres, was $3\frac{1}{2}$ per cent below, the averages for the 1923-32 period, which preceded the recent severe drought years. Crop production, also affected by the shift from corn and cotton to less intensive crops, was nearly 5 per cent above average and almost as high as in the most favorable seasons of the past 20 years, except only 1937, when unusually heavy yields resulted in a production surpassing the predrought average by over 13 per cent. The Department pointed out that due to large reserves carried over from the bumper crops of 1937, supplies of some crops which could be stored were relatively larger in 1938 than production figures alone indicated. Appearances of an abundance of crops were attributed in part to the relatively small numbers of livestock on the farms to consume the grain and to a lower level of domestic and foreign demand than was considered normal a few years ago. However, with crop production in 1938 at 104.8 per cent and population at 109.6 per cent of the predrought average, crop production per capita appeared at least 4 per cent lower than in the predrought period.

The wheat crop of the United States in 1938 was estimated at 930,801,000 bu., about 6 per cent above the 1937 crop of 875,676,000 bu., and about 24 per cent above the 1927-36 average of 752,891,000 bu. The total area harvested in 1938 of 70,221,000 acres compared with 64,422,000 acres harvested in 1937 and the 10-year average of 55,325,000 acres. Acreages harvested and total production, respectively, were for winter wheat 49,711,000 acres, 686,637,000 bu.; durum 3,545,000 acres, 40,445,000 bu.; and other spring wheat 16,965,000 acres, 203,719,000 bu. See WHEAT.

Corn production in 1938, estimated at 2,542,238,000 bu., was 4.1 per cent less than the 1937 crop of 2,651,284,000 bu. compared with 1,507,089,000 in 1936 and 2,306,157,000 bu., the average production of 1927-36. The total acreage harvested was 91,792,000 compared with that of 93,741,000 acres in 1937, and the average of 100,259,000 acres. The yield per harvested acre averaged 27.7 bu., exceeded only in the past 15 years by the 1937 yield of 28.3 bu. The 10-year average yield was 22.9 bu. The corn grown for grain was estimated at 2,277,259,000 bu.; the 4,172,000 acres harvested for silage production about 33,475,000 tons; and the balance of the crop, about 5,514,000 acres, was used for forage or grazed by livestock. See CORN.

The oats crop in the United States in 1938 was estimated at 1,053,839,000 bu., about 9 per cent less than the 1937 crop of 1,161,612,000 bu., and 1 per cent larger than the 1927-36 average of 1,042,461,000 bu. The harvested acreage of 35,477,000 acres compared with 35,256,000 acres in 1937 and the 10-year (1927-36) average of 37,961,000 acres. The yield per acre averaged 29.7 bu. versus 32.9 bu. in

PRODUCTION REPORTED BY COUNTRIES IN 1937 AND 1938 OF WHEAT, RYE, OATS, BARLEY, AND MAIZE (CORN) IN BUSHELS •

^a The production given for countries of the Southern Hemisphere is for the crop years 1937-38 and 1936-37. ^b Average 1932-35. Where no figures are given, statistics are not available.

1937 and 27.1 bu., the 10-year average. See OATS.

Barley production in 1938 was estimated to total 252,139,000 bu. raised on 10,513,000 acres averaging 24 bu. per acre compared with 220,327,000 bu. on 9,968,000 acres averaging 22.1 bu. in 1937. The rye crop in 1938 of 55,039,000 bu. compared with the crop of 49,830,000 bu. in 1937 and the 10-year (1927-36) average production of 36,454,000 bu. It was harvested from 3,979,000 acres compared with 3,846,000 acres in 1937. Rye averaged 13.8 bu. per acre in 1938 and 13 in 1937. Buckwheat produced 6,682,000 bu. from 453,000 acres versus 6,764,000 bu. from 426,000 acres in 1937. The rice crop of 1938 of 52,303,000 bu. was the second largest rice crop of the United States, being exceeded only by the record crop of 53,372,000 bu. in 1937 and was harvested from 1,068,000 acres versus 1,088,000 acres in 1937. See BARLEY, RYE, RICE.

Flaxseed production in 1938 totaled 8,171,000 bu. from 954,000 acres as compared with 7,089,000 bu. and 934,000 acres in 1937. Grain sorghums produced an estimated equivalent of 100,816,000 bu. from 7,792,000 acres versus 97,679,000 bu. from 7,476,000 acres in 1937. The portion of the acreage harvested for grain produced 61,020,000 bu. versus 66,556,000 bu. in 1937. Production of broomcorn in 1938 amounted to 36,700 tons from 263,000 acres, compared with 45,500 tons from 302,000 acres in 1937.

Production of sorghum (sorgo) sirup in 1938 amounted to 11,467,000 gal.; sugarcane sirup, 22,221,000 gal.; maple sugar, 1,084,000 lb.; and maple sirup, 2,777,000 gal. In 1938 the sugar-beet crop was estimated at 11,292,000 tons of beets from 931,000 acres, expected to produce about 1,619,000 tons of sugar, compared with the 1927-36 average of 8,383,000 tons of beets from 760,000 acres. The acre yield was 12.1 tons versus 11.6 tons in 1937. Although the crop was the largest on record, the indicated lower sugar content of the beets would result in lower sugar outturn than the 1,642,000 tons in 1933. The 317,000 acres of sugar cane in Louisiana harvested for sugar, sirup, and seed would produce 484,000 tons of sugar, 79,000 tons more than in 1937, 34,986,000 gal. of molasses, and 7,395,000 gal. of sirup. The 36,000 acres in Florida produced 73,000 tons of sugar, 5,400,000 gal. of molasses, and 2,090,000 gal. of sirup.

The hay crop in 1938 of 90,743,000 tons, the largest crop in a decade, which included 80,299,000 tons of tame hay and 10,444,000 tons of wild hay, was 10 per cent larger than the 82,617,000 tons harvested in 1937 and 14 per cent larger than the 1927-36 average of 79,733,000 tons. The 68,083,000 acres harvested averaged 1.33 tons per acre and the 66,064,000 acres harvested in 1937 averaged 1.25 tons compared with the 10-year average of 1.17 tons. Important kinds of tame hay produced included alfalfa, 28,858,000 tons; clover and timothy, 27,754,000 tons; sweet clover, 1,057,000 tons, lespedeza, 2,758,000 tons; cowpea, soybean, and peanut hay, 7,702,000 tons; grain hay, 4,210,000 tons; sweet sorghum for forage and hay, 8,046,000 tons; and other hay crops, 7,960,000 tons. The crop of lespedeza seed was the highest on record and the production of red and alsike clover seed, the next largest. Alfalfa and sweet clover seed made fair increases, whereas the crop of timothy seed was 41 per cent below that of 1937. See HAY.

The potato crop of 1938 was estimated at 369,297,000 bu. compared with 394,139,000 bu. in 1937 and the average acre yield of 122.8 bu. was not far below the 124.2 bu. in 1937, one of the highest on record. Production of sweet potatoes was esti-

mated to be 76,647,000 bu.; of peanuts harvested for nuts, 1,424,825,000 lb., the largest crop on record versus 1,320,675,000 lb. in 1937; cowpeas harvested for peas, 8,474,000 bu.; and soybeans harvested for beans, 57,665,000 bu., the largest crop ever produced, grown on 2,898,000 acres compared with 45,272,000 bu. from 2,549,000 acres in 1937. See POTATOES.

Tobacco production in 1938 was estimated at 1,455,970,000 lb., about 6.2 per cent under the 1937 crop, from 1,626,000 acres versus 1,735,100 in 1937. The decline in production was contributed to by all classes except Maryland and cigar types, being largely accounted for in a decrease of about 8 per cent in production of flue-cured, 13 per cent in fire-cured, and 4 per cent in burley tobacco. Flue-cured tobacco was estimated at 788,060,000 lb. compared with 854,882,000 lb. in 1937; fire-cured, 99,763,000 lb.; burley, 387,663,000 lb. versus 402,332,000 lb. in 1937; Maryland, 29,250,000 lb.; dark air-cured, 37,863,000 lb.; cigar filler, 46,912,000 lb.; cigar binder, 57,429,000 lb.; and cigar wrapper, 9,030,000 lb. See TOBACCO.

The United States cotton crop in 1938, according to December 1 estimates, was 12,008,000 bales, compared with the record of 18,946,000 in 1937, 12,399,000 in 1936, 10,638,000 in 1935, and 13,201,000 bales, the 1927-36 average. The crop was harvested from 25,346,000 acres versus 34,001,000 in 1937 and 35,496,000, the 1927-36 average. The acre yield of lint averaged 226.8 lb. in 1938 compared with the record yield of 266.9 in 1937. Production of cotton seed would total 5,339,000 tons versus 8,426,000 tons in 1937. See COTTON, articles on other individual crops and production table.

Agricultural Conservation and Adjustment.

The Agricultural Adjustment Act of 1938, approved Feb. 16, 1938, and the programs in operation under it were epitomized by Secretary Wallace as the Nation's well-matured answer to the challenge of an undisputed need for profound agricultural readjustments. The Act continued with amendments the Soil Conservation and Domestic Allotment Act with its provisions for acreage allotments and benefit payments; authorized the Secretary of Agriculture to participate in proceedings before the Interstate Commerce Commission with regard to freight rates on farm products; and provided for the establishment of regional laboratories to develop new uses, markets, and outlets for agricultural commodities. It contained provision for commodity loans and marketing quotas, facilities for an ever-normal granary, and for buying up and canceling cotton-pool participation trust certificates. It established the Federal Crop Insurance Corporation with wheat designated for the first experiment. The 1938 AAA farm program (see 1937 YEAR BOOK, p. 18) was changed in several phases to bring it into line with specific provisions of the new Act.

The 1939 agricultural conservation program, as announced Nov. 15, 1938, followed closely the program for 1938, except for changes required by the Adjustment Act of 1938 in acreage allotments and rates of payment. Nationally, the program provided for encouraging soil conservation, for a level of agricultural production that would meet the country's domestic requirements and all possible export markets, and for adequate reserves. To accomplish these objectives, the 1939 program set a national soil-depleting crop goal of between 270 and 285 million acres, provided for conservation payments to participating farmers on the basis of the \$500,000,000 annual appropriation authorized in

the 1938 Act, and provided for continuing soil-building practices, an essential part of the AAA programs since 1936. In addition, \$212,000,000 in price adjustment payments was authorized by the last Congress to be paid to cotton, wheat, corn, tobacco, and rice producers who seeded within their farm acreage allotments. A range conservation program, similar to that in effect in 1938, was part of the general program. The national acreage goals, to be divided among States, counties, and individual farms, were for corn 94,000,000 to 97,000,000 acres, cotton 27,000,000 to 29,000,000, wheat 55,000,000 to 60,000,000, rice 850,000 to 880,000, peanuts 1,550,000 to 1,650,000, potatoes 3,100,000 to 3,300,000, tobacco 1,480,000 to 1,560,000 for different types, and general crops (including commercial truck) 145,000,000 to 150,000,000 acres. These goals totaled more than 270 to 285 million acres, as the estimated acreage of general crops included corn and potato acreage outside of designated commercial producing areas. A range of payments was announced for each commodity.

In referendums held Mar. 12, 1938, farmers voting approved by more than the required two-thirds margin, marketing quotas comprising the crops from allotments of 26,300,000 acres for cotton; and 705,000,000 lb. of flue-cured tobacco, and 145,000,000 lb. of fire-cured and dark-air-cured tobacco in the marketing years beginning Aug. 1, July 1, and Oct. 1, 1938, respectively. In similar referendums on marketing quotas for the 1939 season held Dec. 10 and 17, 1938, 84.1 per cent of voting farmers favored the cotton quota, while the majorities favoring quotas on burley, flue-cured, and fire-cured and dark tobacco fell short of the required two-thirds, and but 48.2 per cent of the voting rice growers favored a quota for rice.

Payments to farmers in all parts of the country under the 1937 program, together with county, State, and national administrative costs up to July 1, 1938, totaled \$333,352,382. Payments to farmers including county expenses totaled \$315,569,403. Payments in 1938 and 1939 to nearly 5,000,000 farmers under the 1938 program were expected to exceed \$450,000,000, compared with approximately \$330,000,000 under the 1937 program. Besides the conservation payments, cotton farmers would receive about \$130,000,000 under the 1937 cotton-price-adjustment payment plan. Payments to be made under the Sugar Act of 1937 to producers of sugar beets on their 1938 crop would total about \$20,000,000 and payments to sugarcane producers in Louisiana and Florida about \$6,000,000. The first payments from the appropriation of \$212,000,000 for price-adjustment payments would be made to winter wheat producers probably early in 1939. Payments to producers of cotton, corn, spring wheat, rice, and tobacco would be made during the summer and fall of 1939 following the checking of compliance with the 1939 acreage allotments.

Expenditures during the 1937-38 fiscal year for diversion from regular commercial channels of price-depressing surpluses of agricultural products approximated \$54,000,000. In the purchase of over 40 different agricultural commodities distributed for relief use by State welfare agencies, the Federal Surplus Commodities Corporation spent over \$45,500,000 and more than one billion pounds of food-stuffs were procured. Diversion programs for developing new uses and encouraging new domestic markets and exports for agricultural surpluses took slightly more than \$8,500,000. The Corporation was authorized in July, 1938, to buy when necessary during the current season surpluses of oranges, fresh

peaches, vegetables grown in the northeastern States, and wheat and wheat products including flour and cereals. A wheat and flour export sales policy, announced for the 1938-39 marketing season, was expected to result in United States exports of about 100,000,000 bu.

The Federal Crop Insurance Corporation was created by the Agricultural Adjustment Act of 1938 with the primary objective of alleviating economic distress caused by wheat failure due to drought and other causes and was provided capital stock of \$100,000,000, of which \$20,000,000 was available for the first year's operation, beginning with the 1939 wheat crop. The board of directors, including M. L. Wilson, J. W. Tapp, and R. M. Evans, appointed Roy W. Green as manager on Feb. 23, 1938, and he was succeeded Dec. 30, 1938, by Leroy K. Smith. Branch offices were set up at Kansas City and Minneapolis with a small one for the Eastern States at Washington, D. C. County committees of the Agricultural Adjustment Administration served as local units for handling the insurance and State committees assisted in supervision. The policies guaranteed that farmers would have from 50 to 75 per cent of their average wheat crop to sell, despite unavoidable losses from hail, grasshoppers, fire, flood, and drought. The premium rate was based on the loss history of the individual farm and the county for a 10-year period, and the premium might be paid either in warehouse receipts for wheat of the specified class and grade or in its cash equivalent. The grower's losses were to be reimbursed in bushels of wheat or the cash equivalent. Wheat prices would not influence operations of the insurance program. The Corporation reported that on Dec. 1, 1938, 234,485 growers had applied for the insurance, more than 103,000 premium payments, largely from growers in midwestern and Great Plains States, had been received, and the insurance reserve holdings of wheat amounted to 3,069,000 bu.

The Agricultural Adjustment Administration administered the conservation and adjustment program under the general direction of Howard R. Tolley until October, 1938, when major changes were made in the general structure of the U.S. Department of Agriculture. Activities under the Sugar Act of 1937 and the Federal Surplus Commodities Corporation were each given bureau status and the latter assigned marketing and marketing agreement programs and surplus division activities of the adjustment administration, and program planning activities were transferred to the Bureau of Agricultural Economics, now headed by Mr. Tolley. R. M. Evans was then appointed administrator of the Agricultural Adjustment Administration. Its major responsibility would continue to be administration of the national conservation and adjustment program, buttressed by an ever-normal granary through commodity loans, marketing quotas, and parity payments when authorized.

Farm Credit Conditions. The volume of short-term credit used by farmers was expected by the U.S. Department of Agriculture, late in the year, to be greater in the immediate future than in 1938, primarily because of loans by the Commodity Credit Corporation on cotton, corn, and wheat; substantial carry-overs of debt from 1938 by cotton, wheat, and vegetable growers; and increased demand for livestock financing. There would be ample short-term credit for meeting all demands by farmers of good credit standing, and the Farm Security Administration had an increased appropriation for loans to rehabilitate farmers un-

able to obtain credit from customary sources. Plentiful supplies of credit for co-operative purposes would also be available.

Outstanding personal and collateral loans to farmers held by commercial banks and short-term loans held by the Farm Credit Administration increased during the year ended June 30, 1938, from \$956,700,000 to \$1,167,700,000, or more than 22 per cent, this increase largely being accounted for by a rise of \$199,300,000, or 27 per cent, in loans held by commercial banks. The outstanding loans of banks for co-operatives increased during 1937-38 from \$45,000,000 to \$81,200,000, which comprised commodity loans \$28,600,000, operating-capital loans \$29,800,000, and facility loans \$22,700,000. Since its inception the Rural Electrification Administration had allotted \$142,000,000 for loans for construction of rural distribution lines and 5-year loans to finance installations of wiring and plumbing in 45 States. From July 1 to Sept. 30, 1938, allotments totaled \$54,300,000, compared with \$29,300,000 during 1937-38 and \$46,400,000 during 1936-37. Community and co-operative enterprise loans made by the Farm Security Administration amounted to nearly \$2,000,000 in 1937-38.

Exceptionally large increases in bank loans in the Southern States evidently were for storage of the immense cotton crop of 1937, for on Aug. 31, 1938, commercial banks held about \$109,000,000 of Commodity Credit Corporation loans on cotton versus no loans of this type a year earlier. These loans, made available in 1938, averaged about 59 cents per bu. on wheat and 8.3 cents per lb. on $\frac{7}{8}$ -inch middling cotton. That loans on the 1938 corn crop, as required under terms of the 1938 Agricultural Adjustment Act, would be made at the rate of 57 cents per bu. to farmers in the commercial corn area was announced Nov. 10, 1938. Disbursements on loans made by the Commodity Credit Corporation during the late months of 1937 and through Aug. 31, 1938, on the 1937 cotton crop amounted to \$125,200,000 and on the 1937 corn crop \$9,600,000; and there were \$7,700,000 advanced during the first eight months of 1938 on turpentine and rosin, and about \$25,000,000 were advanced on miscellaneous commodities, including butter, peanuts, prunes, raisins, wool and mohair, wheat, dates, and figs.

There was a reduction during the fiscal year 1937-38 in new loans made from special appropriations for rehabilitation and emergency relief purposes. Emergency crop production loans administered by the Farm Credit Administration amounted to only \$21,600,000 during 1937-38 as against \$33,000,000 during 1936-37. However, loans for rehabilitation and emergency purposes, made by the Farm Security Administration, amounted to \$67,300,000 during both 1937-38 and 1936-37, and its additional grants to distressed farmers and their families exceeded \$26,000,000 during 1937-38 and approximated \$34,500,000 during 1936-37.

Since the peak of the demand for emergency financing had passed, demand for farm mortgage credit was expected to continue at the relatively low levels of 1937 and 1938, and no substantial change in the amount of credit required for land transfers was in prospect. Commercial banks, life insurance companies, and other private lenders were lending on farm mortgages much more freely than even two years ago. Funds available for such loans from both Federal and private agencies were abundant. Increased amounts were available for tenant-purchase loans under the Bankhead-Jones Farm Tenant Act, i.e. \$23,750,000 for 1938-39, compared to \$9,200,000 in 1937-38, and making 731

counties eligible for these funds. The Federal Housing Administration had been authorized to insure mortgage loans on farm real estate under specified conditions.

Farm mortgage indebtedness increased from \$3,320,470,000 in 1910 to \$7,857,700,000 at the beginning of 1920, and by 1928 totaled about \$9,469,000,000. A 17 per cent decrease—largely through foreclosures—occurred from 1930 to 1935, and on Jan. 1, 1937, the estimated indebtedness had been reduced further to \$7,254,821,000. Personal and collateral loans to farmers by commercial banks rose from about \$1,608,000,000 in 1914 to a peak of nearly \$3,870,000,000 in 1920, and then declined almost continuously to below \$600,000,000 in 1936. The reduction since 1920 was accompanied by a decrease of almost one-half in the number of banks operating in the agricultural areas. From June, 1936, to June, 1937, these loans increased 10 per cent. Total farm-mortgage debt decreased about \$173,000,000, or more than 2 per cent during 1937, and farm-mortgage loans held by leading lending agencies, accounting for about 60 per cent of the entire debt, decreased about 1 per cent during the first half of 1938. The estimated outstanding farm-mortgage debt of \$7,082,000,000 for Jan. 1, 1938, was 7 per cent below the total for Jan. 1, 1935, and 23 per cent below the total for Jan. 1, 1930. Outstanding farm mortgage loans held by Federal Land Banks and Land Bank Commissioner totaled \$2,803,764,000 on June 30, 1938; by life insurance companies (estimated) \$891,000,000; commercial banks \$512,774,000; and held by joint stock land banks \$94,139,000. Consult the *Credit Outlook for 1939* (Agr. Financial Rev. 1: [No. 2] 1-10); *A Graphic Summary of Agricultural Credit* (M.P. 268), both U.S. Department of Agriculture, 1938.

Farm Credit Administration. A co-ordinated credit system for agriculture was provided by the Farm Credit Administration and permanent institutions under its supervision, including Federal land banks, National farm loan associations, Federal intermediate credit banks, and banks for co-operatives. Also under its jurisdiction were emergency crop and feed loan offices, expected to be temporary in character, and the regional agricultural credit corporations, Agricultural Marketing Act revolving fund, and joint stock land banks which were in the process of orderly liquidation. Other agencies of the credit administration included its examination, finance and research, legal and credit union divisions, and the co-operative division with research, service, and educational subdivisions. Governor William I. Myers resigned July 1, 1938, to head a department of Cornell University and was succeeded Aug. 20, 1938, by deputy governor Forrest F. Hill. E. A. Stokdyk and Rufus R. Clarke were appointed deputy governors during the year.

Current interest rates on the several types of loans were: On Federal land bank farm mortgage loans 4 to 4½ per cent; on new loans and Land Bank Commissioner farm mortgage loans 5 per cent as basic rates but reduced by Act of Congress to 3½ and 4 per cent, respectively, for interest due on installment dates prior to July 1, 1940; production credit loans to finance farm and ranch operations 5 per cent; and farmers' co-operative-commodity 2 per cent, operating capital 3 per cent, and facility loans 4 per cent. The current totals of these loans are shown above. Federal land bank bonds totaling \$22,439,300 bearing 4 per cent interest were called on May 1, 1938, and about \$14,000,000 at 4½ per cent were called Nov. 1, 1938, both for cash redemption.

Co-operative surveys by the credit administration and State agencies during the year showed 15,573 farmers' co-operatives and mutual companies in the United States, including 10,900 engaged in marketing farm products, purchasing farm supplies, or related services; 2500 mutual irrigation companies; and 1940 mutual fire insurance companies. More than 3,000,000 persons were estimated to hold membership in these organizations and at least 500,000 more patronized them without membership. The heaviest concentration was in the North Central States, although associations in Eastern, Southern, and Pacific States have advanced since the depression. The marketing and purchasing co-operatives carried on a marketing business of \$1,960,000,000 in 1937-38, 10 per cent increase over 1936-37, and increased by 23 per cent the volume of co-operative purchasing, buying supplies worth \$440,000,000. Mutual fire insurance companies had in force enough fire insurance to cover to three-fourths of its value more than half of all the insurable farm property in the United States, the insurance totaling more than \$11,000,000,000 and held by about 3,260,000 members. (See *Agricultural Co-operative Associations in the United States*, Farm Credit Quar. 3: [No. 3] 1-9, 1938.) The 535 production credit associations, serving every agricultural county in the country, made about 240,000 loans in 1938 for \$300,000,000, nearly \$15,000,000 above 1937. These associations had 263,000 members, investing \$14,000,000 in voting stock in their associations. Consult also the *Fifth Annual Report of the Farm Credit Administration, 1937, Farm Credit Quarterly, Agricultural Financing Through the Farm Credit Administration, 5 Years of Progress in Co-operative Credit, and Short-Term Credit—A Good Farm Tool* (all Farm Credit Administration, 1938).

Farm Security. Rehabilitation loans totaling \$65,068,016 to nearly 200,000 needy farm families, many from relief rolls, were made by the Farm Security Administration (Will W. Alexander, administrator) during the fiscal year 1938 to enable them to become self-supporting farmers. More than 649,000 families received individual rehabilitation loans totaling \$216,876,146 since the program began in July, 1935. Although most of the loans were not yet due, over \$52,000,000 was repaid up to June 30, 1938, and nearly 63,500 families had paid back in full. The scope of farm activities was widened for 47,310 families by 2952 community service loans involving a total of \$1,934,703 to make heavy equipment, improved livestock sires, and other group services available to farmers in neighborhoods previously without them. In drought and flood areas and in cases of emergency distress, 7010 families received emergency loans totaling \$1,009,396, and about 250,000 families received emergency relief grants amounting to \$23,062,062 during 1937-38.

Progress surveys indicated that throughout the country, except in areas suffering from drought and other catastrophes, standard rural-rehabilitation clients had increased their home food production, farm diversification, working equipment, living standards, and total net worth. An analysis of 70,000 rural rehabilitation families, based on studies in eight States and other areas, showed that practically all rehabilitation clients were bona-fide farmers and that most of them were tenants. The groups largely comprised middle-aged farmers whose families were larger than average for the farm population in their respective areas and below the minimum for decent standards of living.

Many farmers continued to need help in obtaining adjustments of their debts and conciliation of

creditor's claims. During the year the farm debt adjustment service, working with local voluntary committees, aided 16,663 families to reduce farm debts aggregating \$56,500,000 by a total of \$13,692,560. Since 1935 settlements were completed in 80,255 cases involving \$265,803,668; the reductions of \$65,961,643 obtained enabled farmers benefited to pay \$4,175,759 in back taxes to local agencies. The adjustment committees also adjusted indebtedness of group enterprises, such as irrigation and drainage district bond issues, securing reductions in 1937-38 totaling \$3,269,462 from debts amounting to \$5,159,560 and involving 4472 farmers.

Careful initiation of the program authorized by the Bankhead-Jones Farm Tenant Act of 1937 (see 1937 YEAR BOOK, p. 21) resulted, by June 30, 1938, in 1887 loans from the \$10,000,000 appropriation, to tenants, share croppers, and laborers for purchase of farms. The loans to finance the average farm purchase of 130 acres averaged \$4890, of which \$4077 was spent for the farm and \$804 for repairs and improvements. Great differences in land costs and farming methods as between various regions resulted in family-sized farms costing almost triple in some States as in others, and size of farms bought showed even greater disparity. The 105,868 applications received July 1-Dec. 15, 1938, and those from eligible farmers not receiving loans in 1937-38 made a total of more than 140,000 applications for the 5000 loans available under the 1938-39 appropriation of \$25,000,000.

Rural homestead projects, completed or under development, included scattered farm, farm community, and subsistence-homestead projects, and numbering 146, were expected ultimately to accommodate 15,417 families. The 76 completed by June 30, 1938, cared for 6264 families. Construction activities on the projects were marked chiefly by the evolution of new low-cost construction methods making it possible to build four- and five-room farm houses for \$1050 to \$1350.

Construction was completed on June 30, 1938, in the greenbelt towns, suburban to Washington, Cincinnati, and Milwaukee, respectively, and the first families occupied homes in Greenbelt, Md., in October, 1937, and in Greenhills, Ohio, and Greendale, Wis., in May, 1938. Greenbelt, Md., had an established local government at the end of the year, while Greenhills and Greendale were still administered by managers of the security administration and were under the political jurisdiction of their counties. These projects were designed primarily to provide modest, wholesome homes for low-income families in crowded cities.

World Agriculture. Exceedingly active agricultural policies have been developed in practically all foreign countries during the period since the world depression began. Governmental intervention for agriculture, as reviewed and appraised by the U.S. Department of Agriculture, has ranged from protection against imports through simple customs duties to far-reaching state control of all phases of agriculture in totalitarian states. The decline in imports and rise in production in deficit countries resulting from these policies has been held responsible in considerable measure for the large decline in agricultural exports from the United States since 1929. These exports also have been affected by intensification of competition on world markets from other surplus-producing countries, partly due to governmental policies. No rigid line of demarcation exists between surplus and deficit countries, for surpluses in one branch of agricul-

ture may accompany deficits in others and vice versa.

The five leading deficit countries—the United Kingdom, Germany, France, Italy, and Japan—which have been the most important foreign outlets for American agricultural products currently, have well-developed systems of agrarian protectionism for the benefit of domestic agriculture. In Great Britain, France, and Japan, the protective system also has considered the interests and problems of their colonial empires. Methods employed in deficiency countries have included import restrictions, the quota device, foreign exchange control, internal regulation of the marketing, production, and even consumption of agricultural products (reaching a climax in totalitarian states), and relief from the burden of farm debt. Policies of surplus-producing countries, including Canada, Australia, Argentina, Brazil, Netherlands, Denmark, and Hungary, which compete with the United States on world markets, were developed around the central problem of control of surpluses, which had depressing effects on agricultural prices. In Soviet Russia, normally a surplus-producing country, the problem had been a reorganization of agriculture along socialist lines and an increase in output of farm products. Among methods adopted to deal with the surplus problems were subsidization of exports, devaluation of currency, preferential trade agreements, and with animal products in the Netherlands and Denmark, the restrictive type of production control. (For details consult *Foreign Agriculture* 2:3-56; 59-11, 1938.)

Conditions and trends in agriculture in foreign countries which affected or might affect the agriculture of the United States, especially in world trade, included recent farm labor and social legislation in England, the Indian textile industry and American cotton, agricultural development in Newfoundland, crop diversification in Jamaica, wheat marketing plan in South Australia, and establishment of a fruit monopoly in New Zealand; the increased consumption and expanding market for American tobacco in the Scandinavian and Baltic countries, the hog industry in the Baltic States, colonization and land settlement in Finland, and home industries in rural Norway; agriculture in the new trade agreement with Czecho-Slovakia and fixed prices and reduced acreages for the Czecho-Slovak beet-sugar industry; regulation of production of citrus fruit in Algeria; economic implications of the Austria-German union, Germany's plans to reconstruct Austrian agriculture, consolidation of scattered farm holdings, and farm labor shortage in Germany; inauguration of a five-year plan in Hungary; the hog industry in the Netherlands; farm aid and new cereal policy in Poland; encouragement of colonial cotton production by Portugal; cotton growing, and state grain farms in the Soviet Union; national planning of agriculture in Iran; Turkish aid to institutions handling farm products; land conservation in Yugoslavia; trends and possibilities of cotton production in China, the Chinese textile industry and American cotton, the effect of the Sino-Japanese conflict on Chinese agricultural production and trade, and the exchanging of finished textiles by Japan for Australian wool; wheat production, regulation of the flour and the fruit and vegetable industries, and liquidation and refinancing of mortgage debts in Argentina; agriculture in Peru; control of the banana industry in Ecuador; agricultural expansion in Colombia; government price-control of foods, control of henequen,

and a new agricultural program in Mexico; and crop diversification in Cuba.

AGRICULTURE, U.S. DEPARTMENT OF. The Department of Agriculture in 1938, in addition to its customary attention to agricultural research, extension, and regulatory work, continued to lay emphasis on the correction of agricultural maladjustments and the means of bettering the economic environment of the American farmer. These efforts of the Department led to the adoption of a program providing a rational approach to these problems in which conservation, efficient farming, and balanced production are combined. This program involves (1) keeping the acreages of the more important crops within individual county, State, and national allotments and goals, (2) if yields turn out above the average, resorting to storage of the crops and meeting farm financial needs by obtaining from the Government a commodity loan on the stored material, and (3) if these measures should fail, by the

farmers voting upon themselves marketing quotas to bring supplies into line with demand. In this plan, the basis of the so-called ever-normal-granary objective, the first two steps are entirely voluntary and the third is an emergency procedure.

On October 6 Secretary Henry A. Wallace announced major changes in the organization of the Department designed to expedite its services to the public. Under these changes, made to unify the four lines of work which have assumed the highest importance in the pursuit of the Department's economic program, the Bureau of Agricultural Economics was assigned the forming of plans to guide the entire group of agricultural adjustment, conservation, and marketing services. Four units responsible to the Secretary through the Director of Marketing and Regulatory Work were charged with the execution of the marketing plans and studies. The Soil Conservation Service was directed to work out all physical land-use programs involving operations by the Government on farm lands and the chief of the Bureau of Chemistry and Soils, to unify the direction of research in agricultural and industrial technology, was placed in charge of these activities in his own bureau and in the Bureau of Agricultural Engineering. This reorganization was based on the policy of the Department that (1) farmers must participate in forming and executing their own program, (2) continuing co-ordination within the Department be provided to center efforts on a comprehensive agricultural land-use program, and (3) administrative alignments under efficient supervision be established to bring together lines of activities furthering in the workers the development of judgment and foresight and the use of efficient methods, thus avoiding duplication.

In addition to these changes a Division of Transportation was set up in the Bureau of Agricultural Economics to administer the provisions of the Agricultural Adjustment Act of 1938 relating to transportation of farm products including rates, charges, tariffs, and practices.

After July 1 careful attention was given to a survey for locating the four regional laboratories authorized by the Agricultural Adjustment Act of Feb. 16, 1938, and to be established by the Department for the purpose of discovering new and developing wider markets for agricultural commodities. The Agricultural Appropriation Act of June 16, 1938, limited the expenditures connected with these laboratories during the fiscal year beginning July 1 to this survey. On December 14 the Secretary announced the groups of States constituting the northern, southern, eastern, and western regions to be served by the laboratories and the location of these agencies at Peoria, Ill., and New Orleans, La., and in the Philadelphia and San Francisco Bay areas for the different regions respectively.

Changes in the personnel of the Department included the appointment of O. E. May, D. F. J. Lynch, P. A. Wells, and T. L. Swenson as directors respectively of the regional laboratories above mentioned. Willis R. Gregg, Chief of the Weather Bureau, died September 14. Toward the close of the year Commander F. W. Reichelderfer, who reorganized and developed the Naval Meteorological Service and also was active in the meteorological work of the Navy Department, was appointed chief of the Weather Bureau.

For the fiscal year ended June 30, 1938, the regular appropriations of the Department aggregated \$828,819,670, supplemented by \$159,342,552 in bal-

ances remaining from appropriations and transfers of the preceding fiscal year and making available a total of \$988,162,222. The emergency funds allocated to the Department for the fiscal year 1938 amounted to \$182,176,035. Of the regular appropriations \$18,978,029 was expended for research, \$1,467,232 for extension work, \$21,696,051 for pest control or eradication, \$13,174,115 for regulatory work, \$48,814,088 for public service activities, \$216,500,000 for road construction, \$420,473,966 for agricultural adjustment, and \$14,837,853 for farm tenancy, rehabilitation, and related work.

AKRON, THE UNIVERSITY OF. A coeducational institution of higher learning in Akron, Ohio, founded in 1870 as Buchtel College and taken over by the city and renamed in 1914. There were enrolled in the summer session of 1938, 492 students. For the autumn day session the enrollment was 1581 and for the autumn evening session, 1404. The faculty numbered 116. The income for the year, including tax levy from the city, was \$404,104. The library contained 50,716 volumes. The construction of a new student building was begun. President, Hezzleton E. Simmons, Sc.D.

ALABAMA. Area and Population. Area, 51,998 square miles; included (1930) water, 719 square miles. Population: Apr. 1, 1930 (census), 2,646,248; July 1, 1937 (Federal estimate), 2,895,000; 1920 (census), 2,348,174. Birmingham had (1930) 259,678 inhabitants; Montgomery, the capital, 66,079.

Agriculture. The accompanying table shows the acreage, production, and value of the chief crops of Alabama for 1938 and 1937.

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1938	2,128,000	1,080,000 ^a	\$45,900,000
	1937	2,694,000	1,631,000 ^a	69,582,000
Corn	1938	3,550,000	49,700,000	29,323,000
	1937	3,227,000	46,792,000	31,351,000
Peanuts	1938	366,000	270,000,000 ^b	7,960,000
	1937	336,000	252,000,000 ^b	7,056,000
Hay (tame) .	1938	848,000	662,000 ^c	7,216,000
	1937	862,000	690,000 ^c	7,935,000
Sweet potatoes	1938	107,000	8,560,000	6,848,000
	1937	100,000	8,800,000	8,272,000
Potatoes	1938	42,000	4,326,000	2,379,000
	1937	45,000	3,780,000	1,928,000
Oats	1938	132,000	3,168,000	1,521,000
	1937	126,000	2,646,000	1,614,000

^a Bales. ^b Pounds. ^c Tons.

Mineral Production. Alabama's 34 active iron mines raised their yearly production to 6,307,581 gross tons for 1937, from 4,179,967 tons for 1936. Of this ore (1937) about nine-tenths was hematite. The value of ore shipped from the mines rose to \$10,747,967 (1937), from 6,838,016 (1936). The quantity of coal mined in the State increased to about 12,400,000 net tons for 1937, from 12,229,287 tons (value, \$26,046,000) for 1936. The yearly output of coke from byproduct ovens advanced sharply to 4,252,704 net tons (1937), from 3,089,622, in value \$8,774,694 (1936). Blast furnaces' shipments of pig iron mounted to 2,528,785 gross tons (1937) from 2,061,534 (1936); in value, to \$42,188,993, from \$30,942,051.

Finance. Alabama's State expenditures in the year ended Sept. 30, 1937, as reported by the U.S.

Bureau of the Census, were: For maintaining and operating governmental departments, \$28,620,575 (of which \$2,084,062 was for highways, and \$9,764,767 was for local education); for interest on debt, \$3,223,490; for capital outlay, \$11,086,029. Revenues were \$50,541,821. Of these, property taxes furnished \$6,253,211; sales taxes, \$13,793,100 (including tax on gasoline, \$6,765,515); departmental earnings, \$2,790,399; income taxes, \$2,005,390; sale of licenses, \$6,897,298; unemployment compensation, \$7,243,818; Federal or other grants-in-aid, \$7,555,386. Funded debt outstanding on Sept. 30, 1937, totaled \$73,404,160. Net of sinking-fund assets, the debt was \$72,590,502. On an assessed valuation of \$924,790,574 the State levied in the year ad-valorem taxes of \$6,011,139.

The State owned and operated two productive enterprises, of which the total receipts and expenditures do not appear above. These were a monopoly of alcoholic drinks and a harbor. The monopoly had receipts of \$2,647,964 and expenditures of \$1,861,129. It paid into the State's general revenue \$396,790.

Education. Inhabitants of school age (both white and Negro) were reckoned, for the academic year 1937-38, as 884,281, aged from 6 to 20 years. Enrollments in public schools totaled 669,959. They comprised 501,571 in the elementary group and 168,388 in high schools. The year's expenditures for public-school education were: Current, \$17,716,987; total, \$21,441,126. The year's salaries of the 18,635 teachers averaged \$638.

Political and Other Events. The steel-making industry in the Birmingham district gained the status, as to prices, that it had sought for two decades, when the quotations for steel at Birmingham were reduced to parity with those at Pittsburgh. The United States Steel Corporation, dominating the industry in Alabama by its possession of the Tennessee Coal and Iron Co., made the reduction as part of its general policy, carried out during the summer, of ceasing to base prices at other points of origin on the Pittsburgh price as bottom. The expected effect of the change on the industry in Alabama was favorable, since steel produced there, though sold for less, had a prospect of attaining a volume of sales so much greater as to increase profits and still more to increase employment.

The merchants of Huntsville started in April an agitation to "save Huntsville" from ruin and distress threatened by the idleness of the Dallas textile works, closed for many months on account of difficulty between the management and the Textile Workers' Organizing Committee, an industrial labor organization connected with the C.I.O. The management asserted that it had not received proper aid from the authorities and intended to keep the mill closed.

The intention of the Rockefeller and Carnegie foundations in conjunction to create at Tuscaloosa a medical center with an endowment of \$10,000,000 was announced by Governor Graves on March 26. This center was to operate in alliance with the University of Alabama and the State's mental hospitals; it was to include a medical school giving a four years' course, a nurses' school, a general hospital, and a psychopathic hospital; it was also to establish clinics about the State.

In the Scottsboro case (prosecution of a band of Negro boys for rape; see YEAR BOOK, 1937, p. 24), sentence of death pronounced on Clarence Norris, one of the defendants, in 1937 was upheld by the State Supreme Court (June 16); but Governor

Graves, on a recommendation of the State Board of Pardons, commuted the sentence (July 8) to imprisonment for life.

Under authority of an act of 1935 Mobile County had sought to install voting machines for use at the polls. In litigation on the subject, the State Supreme Court ruled (January 20) that an individual county's doing this would violate the State Constitution's requirement that the system of elections be uniform throughout the State.

Elections. On November 8, Frank M. Dixon (Dem.) was elected Governor, to succeed Bibb Graves. Lister Hill (Dem.), incumbent U.S. Senator by nomination to the seat formerly held by Justice Black of the U.S. Supreme Court, was elected Senator for a full term. Nine U.S. Representatives, eight of them actual incumbents, were elected. All the elected candidates were on the Democratic slate, and the vote merely ratified the generally unopposed choices made at the party's primaries earlier in the year. Senator Hill, though he held only by interim nomination in 1938, had been selected at a Democratic primary held on January 4 to serve out the year. Governor Graves nominated him to the seat after the January primary vote had been counted, to obviate the need of an election for the last year of the Senatorial term then running; Mrs. Dixie Graves, the Governor's wife, who had held the seat as temporary appointee for a few months, resigned to make way for Hill.

Officers. Alabama's chief officers, serving in 1938, were: Governor, Bibb Graves (Dem.); Lieutenant-Governor, none, there being an unfilled vacancy; Secretary of State, Howell Turner; Treasurer, John Brandon; Auditor, Charles E. McCall; State Superintendent of Education, A. H. Collins.

Judiciary. Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, Thomas E. Knight, A. B. Foster, Lucien D. Gardner, Virgil Bouldin, Joel B. Brown.

ALABAMA, UNIVERSITY OF. A coeducational State institution for higher learning at University, Ala., founded in 1831. For the autumn term of 1938 the enrollment was 5200; the summer school registration was 2521. The faculty for 1938-39 numbered 342. The productive funds of the university amounted to \$4,852,264, and the income for the year was \$1,499,117. The library contained 201,000 volumes. President, Richard C. Foster, LL.D., D.C.L.

ÅLAND ISLANDS, REMILITARIZATION OF. See FINLAND under *History*.

ALASKA. A territory of the United States; area, 586,400 square miles; capital, Juneau; population, 59,278 in 1930, 55,036 in 1920; whites (1930) numbered 28,640; Indians and Eskimos, 29,983.

Transportation. While coastal settlements and some places along the Yukon River had transportation by vessel for part of the year, the inland areas were in many cases difficult of access by reason of very low mileage of railroads and highways for the area. Road-building and the encouragement of airplane lines were among the chief public concerns. The Federally owned Alaska Railroad, connecting Seward, on the southern coast, with Fairbanks, on the Tanana River to the north, thus linking the seaboard to the Yukon basin, carried 26,026 passengers in the year ended June 30, 1938; its freight traffic amounted to 155,833 tons, two-thirds of it coal. The railroad operating revenue for the year, \$2,212,845, slightly exceeded the expense of operation, \$2,142,618, but gave the Government no material return on the cost of building the line. The Alaska Road Commission, a Federal agency, was

gradually adding to the Territory's mileage of roads. It had spent \$25,985,591 from 1905 to June 30, 1937, to build and maintain roads, trails, air fields, telephone lines, and shelter cabins. In addition to the trails, it was maintaining 1915 miles of roads; in the succeeding year it constructed 56 miles of road and improved a considerable mileage previously built. The separately organized Bureau of Public Roads constructed and maintained roads within the Alaskan National forests, totaling 246 miles.

Aviation played an increasingly great part in transportation: 155 airplanes were in service in 1938, as against 8 in 1929; passenger miles of flight in the year ended June 30, 1938, totaled 5,634,461; the transportation of freight attained about 1700 tons.

Mineral Production. Yearly production of minerals in Alaska (as estimated by the U.S. Geological Survey) attained \$27,036,000 for 1938; the total rather closely approximated the more accurately determined amount for 1937, which was \$26,989,000. Though these two totals nearly matched, their chief components showed sharp disparities between respective figures for the two years. For 1938 the estimated value of the production of copper fell short of that for 1937 by some \$1,807,000; those of silver and of tin by about \$100,000 each; and those of miscellaneous minor minerals by nearly another \$100,000. The yearly value of the predominant source of return, the production of gold, on the contrary, increased by some \$1,543,000, while a most striking jump in the formerly small production of platinum raised its yearly total by some \$628,000, and coal also was produced to somewhat greater value.

Gold contributed some four-fifths of the total value of minerals produced in 1938, as against three-fourths for 1937. Its yearly production rose in quantity to some 626,200 oz. (1938), from 582,100 oz. (1937); and in value, to approximately \$21,917,000, from \$20,373,000. The output of silver, wholly from ores mined mainly for other metals, fell to 444,000 oz. (1938), from 495,000 (1937); by value, to \$287,000, from \$384,000. Copper mining, in Alaska as elsewhere, slackened; the production of copper declined to some 29,614,000 lb. for 1938, from 36,007,000 for 1937; by value, to \$2,932,000, from \$4,741,000. It was reported that the mines in the Kennecott district, or Copper River region, the chief producers of copper in the Territory, expected to exhaust their known profitable ore and close about the end of 1938; they had produced about \$200,000,000, in value, of all the copper, \$237,000,000, of Alaska's production up to that time.

The great increase in the production of platinum was a remarkable feature of mining in 1938. The estimated yield of platinum (inclusive of allied metals, such as palladium) attained 28,310 oz. (1938), as against 8131 oz. for 1937; the yearly total by value rose to some \$1,025,000, from \$397,000. The higher production was attributed largely to the success of a single new dredging operation situated in the Goodnews district, in southwestern Alaska. The average price obtainable for the recovered metal was \$36.20 an oz.

There were mined 135,700 tons of coal in 1938, as against 131,600 in 1937; in value, \$570,000 (1938) and \$552,700 (1937). The coal had the distinction of being the principal mineral destined for consumption within the Territory. Most of it was described as a lignite of high grade, from the Healy River field, employed both for generating electricity in the Fairbanks district and for widespread

domestic use. Some bituminous coal, dug in the Matanuska field, supplied the Alaska Railroad and customers within reach of it.

Fisheries and Furs. Salmon taken in Alaskan waters and canned for the outside market held its place as the chief product of the territory. By value this product normally provided more than half of all exports. In 1938 the salmon fishery was hindered by a late start, which threatened, because of the highly seasonal nature of the industry, to affect the year's production. The vessels engaged in this industry were accustomed to sail from ports in the Pacific States; in 1938 the Alaska Cannery Workers, a union connected with the CIO, and other labor unions of employees required by these vessels, did not come to an agreement with the operators of the industry until late in May. Consequently, the departure for the salmon waters did not start until the end of the month. There remained, at the end of the year, some uncertainty as to the season's total production. For 1937 the total catch of salmon, as finally reported, numbered 109,114,923, of which over 66,000,000 were pink and nearly 31,000,000 were red salmon; the year's total fell below that of 1936 by 20,211,280 salmon. The decline was entirely in the area of southeastern Alaska, the central and western areas reporting somewhat higher catches. The year's shipments of canned salmon were valued at \$42,677,210; those of other fish and fish products, at \$7,547,815.

Early in 1938 Territorial Delegate Dimond of Alaska sought action in Congress to extend the United States' jurisdiction over the areas of sea adjacent to the Alaskan coast, with a view to preventing the reported operations of Japanese fishing vessels engaged in taking salmon from the off-shore beds where they lived between the seasons of migration to fresh water. Such operations tended to overthrow the good results of Federal work to increase the propagation of salmon for the domestic fishery. Japan agreed (March 25) to require its nationals to stop fishing in these waters.

The Federal monopoly of fur seals killed 55,180 seals at the Pribilof Islands for their skins in 1937. A computation made at the islands indicated, on Aug. 10, 1937, that the herd numbered 1,839,119, or about 8 per cent more than the year before. About 40,000 skins sold late in 1937 and early in 1938 brought nearly \$874,000. There was also considerable shipment from these islands of skins of white and blue foxes, there bred. Shipments of all furs from Alaska in the fiscal year 1938 attained the value of \$2,987,923.

Finance. There continued to exist side by side two systems of public revenue and expenditure particular to the territory: The territorial and that under the Federal authority, operating chiefly through the Alaska Fund. The receipts of the territorial government, for the calendar year 1937, attained \$2,710,973; the disbursements, \$2,503,216. Under acts of the territorial Legislature, revenues were derived from railroad gross receipts, from National forests, from a poll tax for schools, and from taxes on non-resident commercial fishermen, inheritances, profits, and industrial production; there was no territorial ad-valorem tax on property in general, but such taxation was locally levied, especially to support public schools. The territory supported all rural and special schools altogether and met 70 per cent or more of the cost of operating schools in incorporated communities. It received part of the means for this expenditure from the Alaska Fund.

The Alaska Fund, managed by the Federal

Treasury, was maintained by Federal receipts for licenses on occupations and trades conducted outside of the incorporated communities; its receipts for the fiscal year 1937 totaled \$271,923. They were available to the extent of 65 per cent for roads and trails, 25 per cent for support to schools, and 10 per cent for aid to indigents.

Education. There were, in 1938, four-year high schools, accredited by the University of Washington, in 11 cities. In addition to the public schools in regular districts, there were special schools outside of such districts, maintained by the territory in areas of scant population. The public schools in general educated the white children and those of mixed blood. Education for the native races was provided by the Federal Government through the Office of Indian Affairs. It operated, in 1938, 99 elementary schools, in which 4417 native children were enrolled, and two vocational schools, having 306 pupils. In connection with the schools, much work was done among adult Indians and Eskimos toward teaching them medical aid, organized co-operation, and the care of reindeer. These schools' support for the academic year 1937-38 cost \$690,000, inclusive of money for the aid of destitute persons.

Political and Other Events. Alaska had, in 1938, a system of old-age assistance and care for neglected children, in accordance with the Social Security system. The cost of the support of the aged poor for the fiscal year 1938 was \$236,396, of which the Federal Government contributed nearly half. The number of the aged poor receiving such support was 1019 on July 1, 1938. Alaska's system of unemployment compensation, created in 1937, had collected from the employers of some 25,000 persons more than \$500,000 by June 30, for the fund toward this purpose; it was estimated to approximate \$1,000,000 by the end of December, and payments from the fund were to begin in January, 1939.

Governor Troy, in his report for 1938, noted an increase in agricultural settlement and development, particularly on the Kenai Peninsula. The Matanuska Valley colonizing enterprise, started in 1935, continued in spite of some setbacks. New colonists replaced some who had left, so that the families in the colony in the summer of 1938 numbered 165, as against the original 200. About 2300 acres were wholly cleared and 1800 more partly so. Jurisdiction over the enterprise passed, in September, from the old Federal Emergency Relief Administration, then in dissolution, to the Department of the Interior. The colonists were at that time still receiving Federal aid.

ALBANIA, ăl-bă'ni-ă. The smallest of the Balkan states, situated on the east shore of the Adriatic Sea, Albania has an area of 10,629 square miles and a population estimated at 1,100,000 on Jan. 1, 1937 (1,003,124 at the 1930 census). Capital, Tirana (pop. 30,806 in 1930). The 1930 populations of the other principal towns were: Shkodër (Scutari), 29,209; Korçë (Koritsa), 22,787; Elbasan, 13,796. Durrës (Durazzo), with 10,000 inhabitants, is the chief port. Reigning sovereign in 1938, King Zog I, who ascended the throne Sept. 1, 1928.

Education and Religion. Elementary education is nominally compulsory but illiteracy remains high. In 1936 there were 2017 pupils in infant schools; 50,889 in 631 state primary schools; and 5404 in 13 state secondary schools. The distribution of the population by religious faiths was estimated as follows: Moslems, 688,280; members of

the Orthodox (Christian) Church of Albania, 210, 313; Roman Catholics, 104, 184.

Production. Primitive agriculture and livestock raising are the chief occupations. Only about 926 square miles of land are under cultivation, of which the state owns about 125,000 acres. The principal products are tobacco (1600 metric tons in 1936), wool (2100 tons in 1936), hides, timber, furs, cheese, eggs, fish, olive oil. The 1937 harvest of other crops was (in metric tons): Wheat, 39,900; barley, 5700; rye, 3800; oats, 11,200; corn, 137,900. Grapes, cotton, potatoes, and fruit are also grown. The 1936 livestock census showed 62,490 horses, 64,290 asses, 8400 mules, 382,658 cattle, 1,477,674 sheep, 975,428 goats, and 23,294 swine. Petroleum, bitumen, lignite, salt, and copper are produced in small quantities. Manufacturing is in the elementary stage, confined largely to the preparation of olive oil, flour, and cheese.

Foreign Trade. Imports in 1936 were valued at 16,777,691 gold francs and exports at 7,434,621 gold francs (20,315,687 and 10,175,065, respectively, in 1937). Italy, Great Britain, Yugoslavia, and Czechoslovakia were the chief sources of supply in 1936 and Italy and the United States the chief foreign markets. The principal exports are wool, hides and furs, cheese, eggs, cattle, and bitumen. Cotton and its textiles, benzine, woollen goods, petroleum, and sugar are the chief imports.

Finance. The budget estimates for the fiscal year ended Mar. 31, 1938, balanced at 26,224,787 gold francs; that for 1938-39 provided for receipts of 28,235,000 gold francs and expenditures of 28,565,000. The increase in 1938-39 expenditures was principally for higher salaries of the King, members of Parliament and government civil employees.

In return for political and economic concessions, Albania obtained a loan of 50,000,000 gold francs in May, 1925, and in June, 1931, another loan of 100,000,000 gold francs, to be paid in 10 annual instalments. The Albanian Government made a profit of 15,000,000 gold francs on the first loan through the rise in the value of the lira. The total sum of 65,000,000 gold francs was administered by the Italian Company for the Economic Development of Albania and guaranteed by both the Italian Treasury and the Albanian customs and monopolies receipts. Instalments on the second loan were suspended by Italy due to political differences after 17,500,000 francs had been paid. On Mar. 19, 1936, a new Albanian-Italian agreement annulled the 1931 loan and arranged for three new Italian loans to Albania totaling 28,735,000 gold francs. Another Albanian-Italian financial agreement signed Apr. 21, 1938, relieved the Albanian Government of the obligation to pay Italy interest and amortization in arrears to the amount of 69,900,000 gold francs, but Albania agreed to repay the face amount of its debt to Italy over a period of 15 years.

Transportation. There are no railways, but highways passable to motor cars extended 1755 miles in 1937 (number of automobiles, 829). Airlines connected Tirana with Rome, Salonika, Shkodër, Korçë, Vlönë, and other towns. A treaty signed in 1935 gave Italy a 10-year monopoly of Albanian air services.

Government. The Constitution of 1928 vests executive power in the King and a Council of Ministers appointed by him. The unicameral parliament of 58 members is indirectly elected. Premier in 1938, Koço Kotta. King Zog ruled the country along dictatorial lines with the aid of Italian advisers. A 20-year defensive alliance was concluded by Albania and Italy on Nov. 22, 1927.

History. Italy further tightened its political and economic control over Albania by a financial agreement signed in Tirana Apr. 21, 1938 (see *Finance* for terms). Coincident with this agreement, King Zog's government pushed through Parliament a bill granting a monopoly of fishing rights in Albanian waters to a company in which Italians held 51 per cent and Albanians 49 per cent of the shares. The company was authorized to employ armed fishery guards despite opposition protests that this established a foreign (Italian) armed force in Albania. In June, Mussolini made a move to lessen anti-Italian sentiment in Albania by sending 20 carloads of grain to Albanian districts that had been ravaged by floods. These developments all served to emphasize the increased strategic importance Italy attached to its domination of Albania following the annexation of Austria to Germany in March.

On Apr. 27, 1938, King Zog was married at Tirana to Geraldine Apponyi, a Hungarian countess whose mother was the former Gladys Virginia Stewart of New York. The ceremony was attended by Count Galeazzo Ciano, Italian Foreign Minister. While three of the King's sisters were visiting the United States in March, they were reported to have effected a reconciliation between Zog and Bishop Fan Noli, former President of Albania, whom Zog overthrew in 1924. An amnesty decree affecting all political refugees and freeing nine political prisoners was issued by King Zog at the beginning of September in celebration of the 10th anniversary of his accession to the throne.

ALBERTA, ăl-bŭr'ta. A province in western Canada. Area, 255,285 square miles; population (1938 estimate), 783,000 compared with 772,782 (1936 census). There were 12,029 Indians (1936). Chief cities (1936 census): Edmonton, the capital, 85,774 (88,887 in 1938); Calgary, 83,407; Lethbridge, 13,523; Medicine Hat, 9592. During 1936 there were 15,709 births, 6146 deaths, and 6016 marriages. The elementary and secondary schools had 167,193 pupils enrolled during 1936. In the University of Alberta there were 2069 students (1936-37).

Production. For 1937 gross agricultural revenue amounted to \$177,488,000 (\$149,000,000 in 1936) of which field crops from 13,408,800 acres represented \$130,474,000 (\$103,603,000 in 1936); dairy products, \$17,117,000. Wheat produced (1937) totaled 74,000,000 bu.; oats, 77,000,000 bu.; barley, 22,100,000 bu. Livestock in the province (1937): 1,457,300 cattle, 661,200 horses, 768,500 sheep, 773,700 swine, and 6,793,500 poultry. Fur production (1935-36): 1,274,919 pelts valued at \$1,696,383. Forest production (1936) was equivalent to 101,474 M cu. ft. valued at \$3,048,013. The fisheries catch in 1937 had a value of \$433,354.

Mineral production (1937) was valued at \$25,597,117 of which coal (5,562,839 tons) accounted for \$14,563,911; crude petroleum (2,749,085 bbl.), \$4,961,002; natural gas (20,955,506 M cu. ft.), \$4,766,437. The 905 manufacturing plants (exclusive of central electric stations, and cleaning, dyeing, and laundry establishments), with a total of 11,756 employees, had a net value of production of \$25,000,136 for 1936.

Government. For the fiscal year ended Mar. 31, 1938, revenue amounted to \$24,127,805; expenditure, \$21,359,739; net public debt, \$127,849,027. Executive power is vested in a lieutenant-governor (appointed by the Canadian Governor General in Council), assisted by the executive council or ministry of eight members which is responsible to the legislature. The legislature consists of 63 members

(including the ministry) elected by the direct vote of the people (in the provincial election of Aug. 22, 1935, 56 Social Credit, 5 Liberals, and 2 Conservative members were elected). Alberta is represented in the Canadian parliament at Ottawa by 6 Senators (appointed for life) and 17 elected members in the House of Commons. Lieutenant-Governor, J. C. Bowen (appointed Mar. 20, 1937); Premier, William Aberhart (Social Credit).

History. The decline in the fortunes of Premier Aberhart's Social Credit Government, noted in preceding YEAR BOOKS, continued during 1938. On March 4 the Canadian Supreme Court upheld the Dominion government's action in disallowing three bills passed by the Alberta Legislature in 1937 which authorized the regulation of credit, drastic control of the press, and confiscatory taxation of the banks. The Court's decision went much further and declared unconstitutional the Social Credit Act providing the legal basis for the entire Aberhart program. The tribunal at the same time upheld the right of the Lieutenant-Governor of the province to withhold his consent to legislation and also the power of the Dominion Government to disallow provincial legislation, both of which had been contested by Premier Aberhart. Aberhart then carried an appeal from the Court's ruling on the Bank Taxation Bill to the Judicial Committee of the Privy Council in London. The latter court on July 14 upheld the ruling of the Canadian Supreme Court by dismissing the appeal. It characterized the Bank Taxation Bill as "part of a legislative plan to prevent the operation within the Province of those banking institutions which had been called into existence and given the necessary powers to conduct their business by the only proper authority, the Parliament of Canada."

Meanwhile, the Alberta Legislature had proceeded to enact additional legislation designed to relieve the debt burden of the farmers. The moratorium on private debts was extended and a bill was passed outlawing by July 1, 1940, all debts incurred previous to July 1, 1936. A new Securities Tax Act imposed a 2 per cent tax on all first, second, and third mortgages. A Home Owners' Security Act required any mortgage holder beginning court action to post a bond of \$2000, which was to be forfeited to the mortgagee in the event of foreclosure regardless of the amount of property involved.

Premier Aberhart also sought to extend his movement into Saskatchewan and made a vigorous campaign on behalf of Social Credit candidates in the Saskatchewan election of June 8. Only two Social Credit advocates were elected out of the 52 legislators chosen. The defeat of the Aberhart invasion encouraged the Ottawa Government shortly afterward to disallow the newly enacted Alberta Securities Tax Act and Home Owners' Security Act, a move that had been delayed for fear of the political consequences. These successive setbacks weakened the Aberhart movement politically and adversely affected Alberta's finances. On June 1 the Province defaulted on its 1908 debentures. Up to the end of 1938, Premier Aberhart had not carried out his promise to distribute a monthly social credit dividend of \$25 to every adult citizen, the plank on which he captured control of the Alberta Government in 1935.

ALFALFA. As reported by the U.S. Department of Agriculture the 1938 production of 28,858,000 tons of alfalfa hay in the United States was 21 per cent above the 10-year average for the years 1927-36 and the acreage harvested for hay, 13,462,000 acres, was 10 per cent above this 10-year average. In 1937 the production of alfalfa hay was 26,944,000 tons harvested from 13,725,000 acres. Weather conditions in 1937 and 1938 favored the recovery of much of the lost or diverted acreage during preceding unfavorable seasons. Much of the increase in acreage was the result of substitution for abandoned grass and clover seedings in the North Central States. The yields of hay reported by the leading States were as follows: California 3,105,000 tons, Wisconsin 2,758,000 tons, Minnesota 2,715,000 tons, Idaho 1,992,000 tons, and Iowa 1,980,000 tons. These States, with Michigan, Colorado, Nebraska, and Montana mentioned in decreasing order of yield, produced nearly 69 per cent of the total yield. In acreage, Minnesota ranked first with 1,263,000 acres, followed by Wisconsin with 1,199,000 acres and Michigan with 1,040,000 acres. Nebraska, which for some years was the leading State in acreage, dropped to fifth place with 789,000 acres. California, with an average yield per acre of 4.3 tons as compared with 2.14 tons for the country as a whole, outranked by far all other States in this regard.

The 1938 production of alfalfa seed, estimated at 998,000 bu. and produced on 583,900 acres, was slightly larger than the preceding crop and above the average of 926,000 bu. for the 10 years 1927-36. The 1938 acreage, the largest on record, was 14 per cent larger than in 1937 and 26 per cent above the 10-year average. The average yield per acre, only 1.71 bu., was 11 per cent smaller than last year and 17 per cent below the average. Among the 21 States reporting production, Oklahoma stood first with 138,000 bu., Utah second with 105,000 bu., and Arizona third with 104,000 bu. A revised regulation by the Department of Agriculture requires that 5 per cent of any seed quantity for sale in this country be stained iridescent violet if of Canadian origin and green if produced in other foreign countries. In the fiscal year 1938 the United States imported 4,589,600 lb. of alfalfa seed of which 2,928,900 lb. came from Canada.

ALGERIA. A French colony in North Africa, with an area of 847,870 square miles, of which all except 222,206 square miles are desert. Capital, Algiers (Alger). At the 1936 census there were 7,234,684 inhabitants (6,592,033 in the Northern Territory and 642,651 in the Southern Territory). The total European population was 987,252, of whom 853,209 were French and 134,043 foreigners. The native population, entirely Moslem, numbered 6,247,432. Populations of the chief cities (1936) were: Algiers, 264,232; Oran, 200,671; Constantine, 113,777; Bona (Bone), 86,332; Philippeville, 66,112; Sidi-bel-Abbes, 54,754. There were (1936) 126 infant schools, with 21,576 pupils; 1210 primary schools, with 156,034 pupils; 17 secondary schools, with 12,638 pupils; 6 normal schools, with 506 students; a university at Algiers with 2258 students, and various special schools. In addition, there were 732 Moslem schools with 75,191 pupils and 3 higher Moslem schools with 171 students.

Production. The chief occupations are agriculture and stock raising. The cereal crops in 1938 were (in metric tons): Wheat, 872,700; barley, 594,300; rye, 1800; oats, 116,200; corn, 3300. Olive oil output (1937-38) was 17,700 metric tons. The yield of potatoes in 1937 was 131,200 metric tons;

tobacco, 17,600 metric tons; wine, 15,424,000 hectoliters (hectoliter equals 26.42 U.S. gal.). Livestock in 1937 included 185,000 horses, 841,000 cattle, 6,267,000 sheep, 189,000 mules, 351,000 asses, 2,930,000 goats, and 173,000 camels. The 1936 wool clip was 21,300 metric tons. The 1937 mineral production was (in metric tons): Coal, 14,000; iron ore (metal content), 1,265,000; lead ore (metal content), 4600; zinc ore (metal content), 8500; antimony ore (metal content, 1936), 2600; pyrites, 39,000; natural phosphates, 631,000. There are extensive fisheries.

Foreign Trade. The 1937 value of imports for consumption was 4,147,600,000 francs (3,233,800,000 in 1936) and the value of exports of Algerian products was 4,333,600,000 francs (3,469,300,000 in 1936). France in 1937 supplied 84.3 per cent of the imports by value and purchased 82.1 per cent of the exports. Textiles, machinery, automobiles, sugar, coal, petroleum products, iron and steel, and coffee are the principal imports, and wine, wheat, and other cereals, livestock, skins and hides, zinc and iron ores, olive oil, phosphates, tobacco products, etc., the chief exports.

Finance. Budget estimates for 1938 placed revenues at 1,862,473,182 francs and expenditures at 1,862,278,981 francs. A French decree of Jan. 11, 1938, authorized the Algerian Government to issue 600,000,000 francs of 6 per cent 20-year bearer bonds at 89.5.

Transportation, etc. In 1936 Algeria had 3048 miles of railway line open for traffic; railway receipts (1936) were 235,176,000 francs. Highways extended 47,479 miles in 1937 and there were 62,240 automobiles. Air lines connected Algiers with Marseille (France) and Brazzaville (French Congo), Algiers-Oran, Algiers-Tunis, and Oran-Elizabethville (Belgian Congo). In 1936, 4094 ships discharged 3,695,982 tons of merchandise at Algerian ports and 4438 ships loaded 6,651,881 tons.

Government. Administration is centralized in the hands of the Governor-General appointed by the French Government, with the exception of the non-Moslem services which are administered by the appropriate Ministries at Paris. There is no parliament or responsible ministry, but partial financial autonomy is exercised by financial delegations representing French colonists, French taxpayers, and natives and by an elected Superior Council. The departments of Algiers, Oran, and Constantine in Northern Algeria are represented in the French Parliament by a total of 10 deputies and 3 senators. Southern Algeria has a French military government. Governor-General in 1938, M. Le Beau, appointed Sept. 21, 1935.

History. In an effort to check the growth of political unrest among the natives of Algeria (see 1937 YEAR BOOK, p. 29), the French Government in 1938 drew up legislation extending French citizenship to Algerians on less onerous terms than before. (Previously no native might become a French citizen except through renouncing his status as a Moslem, including polygamy, the Moslem inheritance law, etc. Consequently, only a few thousand natives had even been naturalized.) The measure aroused strong opposition among French citizens of European origin in Algeria. In March, 11 French mayors of Algerian towns resigned in protest. The native leaders, on the other hand, declared that the bill did not go far enough to meet their demands for greater political rights and a larger share in economic security. See FRANCE under History.

ALIENS. See IMMIGRATION; INTERNATIONAL LAW.

ALLEGHENY COLLEGE. A coeducational institution of higher learning in Meadville, Pa., nonsectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the autumn of 1938 was 673 and for the summer session 176. The faculty numbered 51 members. The productive funds of the college amounted to \$1,500,000, and the income for the year 1937-38 was \$471,000. The Reis Library contained 115,000 volumes. President, William P. Tolley, Ph.D., D.D., Litt.D., LL.D.

ALLIANCE FRANÇAISE, FÉDÉRATION DE L'. An association of clubs and groups, formed in 1902 for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States and Canada. By 1938 it comprised more than 290 local branches, including alliances, affiliated societies, and clubs in universities, colleges, and schools.

Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. The official lecturers for the season 1937-38 were M. Pierre de Lanux, lecturer, journalist, and writer and the Duke de Lévis-Mirepoix, historian, author, and lecturer. The regional lecturers were Messrs. René Bellé and Vincent Guilloton. The Fédération also organizes lecture tours for distinguished French travelers and French lecturers who live in America, assists in organizing courses in the French language and literature in co-operation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. Its Assemblée Générale, attended by representatives of the various groups, was held in New York City, Apr. 23, 1938. The official periodical is *L'Écho de la Fédération*.

The officers in 1938 were: President, Frank D. Pavey; general vice-president, Roger Sherman; president of the executive committee, Albert Blum; treasurer, John F. Daniell; general secretary and director of lectures, Pierre A. Bédard. Headquarters are at 22 East 60th St., New York City.

ALSACE-LORRAINE. The provinces transferred from Germany to France by the Treaty of Versailles (June 28, 1919), now known as the Bas-Rhin, Haut-Rhin, and Moselle departments of France. Total area, 5605 square miles; total population (1936), 1,915,627. See FRANCE under History.

ALUMINUM. The production of bauxite ore, from which aluminum is obtained, reflects the industrial activity of the metal. The U.S. Bureau of Mines reports shipments of bauxite from mines in the United States in 1938, amounted to 319,000 long tons, valued at \$1,838,000 against 420,232 valued at \$2,444,686 in the previous year.

Exports of bauxite, according to the U.S. Bureau of Foreign and Domestic Commerce for 1938, were 43,759 tons of bauxite and other aluminum ores, and 13,967 tons of bauxite concentrates, valued at \$1,459,491. The tonnages for the corresponding period in 1937 were 76,539 and 37,823. Imports for 1938 were 455,693 tons, valued at \$3,521,325, a decrease of 8 per cent compared with the previous year.

New aluminum production in the United States during 1938 was only slightly less than the record output of 1937, according to the Bureau of Mines. A total of 286,882,000 lb. valued at \$56,659,000 was produced in 1938, compared with 292,681,000 lb.

valued at \$55,609,000 in 1937, a decrease of only 2 per cent. Though aluminum production declined only slightly in 1938, domestic consumption declined very sharply, and stocks of primary aluminum were increased by 112,959,000 lb. In previous years the large stocks accumulated prior to 1934 had been reduced steadily. Aluminum imports for consumption also declined in 1938. Since domestic exports of aluminum increased and metal production in most other countries increased, it appears that aluminum consumption outside of the United States increased appreciably in 1938.

Imports of aluminum in ingot, scrap, alloy, etc., into the United States decreased from 44,701,669 lb. valued at \$6,770,400 in 1937 to 17,511,819 lb. valued at \$2,430,828 in 1938; exports increased from 4,719,034 lb. valued at \$967,342, to 9,670,398 lb. valued at \$1,860,796. Of the 1938 foreign trade in ingot, scrap, and alloy, imports were chiefly from Norway, France, Switzerland, and Canada, and exports were chiefly to Germany, Switzerland, Japan, and Great Britain. Plates, sheets, bars, etc., were exported largely to U.S.S.R., Great Britain, and Japan.

Canada, according to the Dominion Bureau of Statistics, established a new record of aluminum ingot exports of 129,448,700 lb., as compared to 97,002,900 in 1937. Great Britain continued to be the leading importer of aluminum ingots from Canada in 1938, receiving nearly 68,000,000 lb. as against 26,000,000 in 1937. Japan was next with 31,000,000 lb. compared with 18,000,000 in 1937. Germany was third with 12,391,200 lb. against 85,700 the previous year. Other leading importers were the U.S.S.R. with 4,264,300, Sweden with 3,572,700, and China with 2,403,400 lb. Exports to the United States declined to 2,233,900 lb.

AMERICAN ASSOCIATIONS AND SOCIETIES. For various scientific and other organizations, whose official titles begin with the word American, see under the important descriptive word of the title.

AMERICAN FEDERATION OF LABOR. See LABOR UNIONS.

AMERICAN LEGION, THE. An organization of World War veterans, chartered by Congress in 1919. Its purpose, stated in the preamble of its constitution, is "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of our association in the World War; to inculcate a sense of individual obligation to the community, state, and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom, and democracy; to consecrate and sanctify our comradeship by our devotion to mutual helpfulness."

The Legion's twentieth national convention was held in Los Angeles, Calif., Sept. 19 to 22, 1938. There were 1341 accredited delegates in attendance, representing every State, the District of Columbia, the departments of Alaska, France, Hawaii, Italy, Canada, Mexico, Panama, Puerto Rico, and the Philippine Islands outside the continental limits of the United States, and seven outlying posts not attached to a department: China Post No. 1; China Post No. 4; Havana, Cuba, Post No. 1; Athens, Greece, Post No. 1; Tripolis, Greece, Post No. 2;

Patras, Greece, Post No. 3; and London, England, Post No. 1. Approximately 150,000 Legionnaires, their families and friends, attended the convention which reached its peak Tuesday, September 20, with an eight-hour parade up Figueroa Street and through the Los Angeles Memorial Stadium by 30,000 marchers, 159 bands and drum and bugle corps, and 70 floats, before 250,000 spectators, making this the greatest parade believed ever to have been held on the Pacific Coast. Chicago was selected for the twenty-first national convention, to be held Sept. 25 to 28, 1939.

The National Executive Committee at its meeting in Indianapolis, Nov. 19, 1938, designated the major legislative program of The American Legion during 1939 to be: 1) government protection for World War widows and orphans; 2) an adequate national defense; 3) Universal Service; 4) veterans' preference and unemployment; 5) and immigration.

The major accomplishments of 1938 were in the fields of Americanism, child welfare, rehabilitation, and legislation.

AMERICANISM. Nineteen Boys' States were conducted in 18 states, with 9632 boys enrolled. In these, boys are taught the practical theory of American government by having them organize a mythical 49th state. Participants go through the entire process of government from formation of political parties to elections, install their officers from governor to constable, enact and enforce their laws, and operate their boy state as adult citizens do in real life, to get accurate knowledge about their future citizenship obligations and responsibilities. More than 500,000 boys under 17 years enrolled in the 12th annual Junior Baseball national tournament, forming 31,000 teams which engaged in elimination play ending in a junior world's series. San Diego, California, had the winning team. 2700 Boy Scout troops were sponsored, to make The American Legion the second largest individual troop sponsor. 9683 school medals were awarded to encourage scholarship in public schools. A national high-school oratorical contest in which 4000 participated was conducted. 383,986 copies of the U.S. Flag Code were distributed. Its safety slide sound films were shown before 500,000. Support was given the Dies Congressional Committee to investigate un-American activities, and a report on subversive activities for presentation to this committee was prepared.

CHILD WELFARE. A new peak in the nationwide child welfare program was reached with splendid co-operation of the departments, posts, Auxiliary, Forty and Eight, Eight and Forty, and The Sons of The American Legion. 30,000 volunteers carried on this work. During the year incomplete reports showed expenditures, in part from its own resources, and in part from outside sources, with a known total of \$4,025,857 in emergency financial aid to 323,327 needy children. \$2,157,293 came from various Legion resources and those of its affiliated organizations, and \$1,868,564 represented local and government benefits obtained through Legion efforts. This represented a new high record in child welfare expenditures for the fourth consecutive year. A portion of the Legion's \$5,000,000 endowment fund income was appropriated for child welfare relief in families of World War veterans. Administrative expenses were paid from dues of members.

REHABILITATION. During the fiscal year ending June 30, 1938, the National Rehabilitation Committee, without cost to the beneficiaries, obtained for World War veterans, and their dependents, the total of \$3,032,919 in recoveries for adjusted compensation, emergency officers' retirement pay, government insurance, disability, death, burials, and other benefits. During this year there was put into effect a change of policy, giving preference in its rehabilitation services to members; and requiring non-members to secure the endorsement of the nearest Legion post. The committee reported there was a grand total of 81 hospital facilities in operation under the Veterans' Administration and that 159,008 World War veterans were admitted to these facilities during the fiscal year, of whom 50,640 were there June 30, 1938.

LEGISLATION. Signal progress toward the ultimate objectives of adequate national defense and government protection for World War widows and orphans was made. Seventeen of the 40 Legion-sponsored measures made law dealt with national defense. Public Law 514 further liberalized existing laws for World War widows and orphans. Thirty other bills in which the Legion was interested were partially enacted. Further progress was made toward enactment of Universal Service legislation. A Federal law making Armistice Day a national holiday received Presidential approval.

For the second consecutive year it was the second best membership year in the history of The American Legion and of its four affiliated organizations. Dec. 31, 1938, there were 974,854 members in The American Legion. This was in excess of the 1937 membership by 1013. The number of posts was 11,506, a new peak. The American Legion Auxiliary for the third consecutive year established an all-time record membership of 464,865 with 9049 units. The Sons of The American Legion for the sixth consecutive year increased its numerical enrollment with 60,383 members and 2911 squadrons. The Forty and Eight membership broke all former records again with 38,415 in 750 voitures. The Eight and Forty had a new high enrollment of 6503 in 251 salons.

The national officers elected for 1938-39 were: National Commander, Stephen F. Chadwick, Seattle, Wash.; Vice-Commanders, Edward J. Quinn, Portland, Me.; Charles W. Crush, Christiansburg, Va.; Earl T. Ross, Reno, Nev.; James T. Crawley, Kosciusko, Miss., and Henry C. Oakey, Osceola, Wis.; National Chaplain, Rev. Jerome L. Fritsche, Kearney, Neb.; National Historian, Thomas M. Owen, Jr., Washington, D. C.; National Adjutant, Frank E. Samuel, Indianapolis, Ind.; National Treasurer, John Ruddick, Indianapolis, Ind.; and National Judge Advocate, Ralph B. Gregg, Indianapolis, Ind. The latter four were elected by the National Executive Committee. National Headquarters were at 777 North Meridian St., Indianapolis, Ind. Legislative and rehabilitation offices of The American Legion were maintained in the Legion-owned building at 1608 K St., N.W., Washington, D. C. Editorial and advertising offices of *The American Legion Magazine* were at 15 West 48th St., New York City.

AMERICAN LITERATURE. See LITERATURE, ENGLISH AND AMERICAN.

AMHERST COLLEGE. An institution for the higher education of men in Amherst, Mass., founded in 1821. For the autumn term of 1938 approximately 880 students were enrolled. The active faculty numbered 80, with 15 assistants. The productive assets of the college amounted to \$11,731,000; the income for the year was \$981,500. The library contained 200,000 volumes. The recently completed Kirby Memorial Theater opened the season of a cycle of five Maxwell Anderson plays with *High Tor*, presented by The Masquers, the college dramatic association. This new theater is the first one at any college or university to be devoted exclusively to dramatic art. President, Stanley King, LL.D.

AMPHIBIA. See ZOOLOGY.

ANDORRA, ăn-dôr'a. A small republic in the Pyrénées between France and Spain, under the joint suzerainty of the Spanish Bishop of Urgel and the President of France. Area, 191 square miles; population, 5231. Andorra, the capital, had about 700 inhabitants in 1937. The language spoken is Catalan. The republic is governed by a council-general of 24 members (12 elected every 2 years) elected for 4 years by male citizens of 25 years of age or over. The First Syndic (President) and Second Syndic (Vice-President) are nominated by the Council-General. Sheep raising is the chief occupation.

History. In April, 1938, 100 French Mobile Guards maintained order while French workmen cleared snow from the highways in order to evacuate the 10,000 Spanish government refugees who had crossed the border to escape the Insurgent drive (see SPAIN under History). French skiers,

with supply packs, crossed into Andorra to provide food for the refugees and Andorrans whose supply was nearly exhausted.

Consult Karl Loewenstein, "Revolution Comes to Andorra," *Events*, July, 1938.

ANGLO-EGYPTIAN SUDAN. A British-Egyptian condominium of northeast Africa. Area, 969,600 square miles; population (latest estimate), 5,945,591 including 57,917 non-natives. Chief towns: Khartoum (capital), 46,676; Omdurman, 110,959; Khartoum North and Rural District, 107,720; Wadi Halfa; Merowé; El Damer; Atbara; Port Sudan; Suakin.

Production. The output of ginned cotton for 1937-38 amounted to 55,700 metric tons from 442,130 acres. Gum arabic (of which the Sudan is the world's chief source), sesame, groundnuts, senna leaves and pods, dates, mahogany, hides and skins, chillies, dom nuts (vegetable ivory), salt, ivory, gold, and shea seeds are other products. The staple grain crops are durra (great millet) and dukhn (bulrush millet). Forests rich in fibers and tanning materials exist along the banks of the Blue Nile. Livestock in the Sudan (1935) included 2,700,000 cattle, 2,000,000 goats, 2,500,000 sheep, 420,000 camels, 375,000 asses, 23,000 horses, 850 mules, and about 3500 pigs (kept by the Nubas).

Trade. For 1937 imports totaled £E6,283,500; exports, £E8,130,450. Imports are divided into Government (£E1,511,600) and public (£E4,771,900) groups. Cotton piece goods, tea, coffee, wheat flour, tobacco, and rayon were the main imports. Cotton (£5,392,500 exported in 1937), gum arabic, cottonseed, sesame, great millet, hides, and skins were the chief exports. Great Britain sent 23.4 of the imports and took 43.1 per cent of the total exports. The Egyptian pound (£E) of 100 piasters was linked with the pound sterling of 97½ piasters and fluctuated with sterling at an almost constant ratio.

Communications. Railway lines open to traffic totaled 2021 miles (of 3 ft. 6 in. gauge). A motor transport service is in service between Juba and Aba (Belgian Congo) and between Juba and Nimule (Uganda border). Government steamers ply the navigable arms of the Nile and its tributaries between Aswan (Egypt) and Rejaf. Caravan routes traverse the country. There is an air service connecting Nigeria and the Gold Coast with the Empire route to South Africa at Khartoum. Telegraphic communication (wire or wireless) is available with Egypt, Eritrea, Western Ethiopia, Kenya, Uganda, and Saudi Arabia. The Khartoum-Port Sudan trunk telephone was placed into operation during 1938. There are about 25,200 miles of roads.

Government. For 1937 the estimates were balanced at £E4,672,500. In the budget for 1938 revenue was estimated at £E4,769,263; expenditure, £E4,478,401. The country is administered by a governor-general (appointed by Egypt with the assent of Great Britain) aided by a governor-general's council. The Egyptian and British flags are flown together. The governor-general in council makes all ordinances, laws, and regulations. Governor-General, Sir G. S. Symes (appointed Oct. 30, 1933).

History. During the latter part of the year the governor-general visited Cairo and reached a settlement with the Egyptian government on most of the remaining financial matters existing between the two countries. It was decided to discontinue the Egyptian subsidy to the Sudan of £E750,000 after two years, during which time it is to be cut down. The agreement covers debts due to Egypt by the Sudan, minor matters of irrigation, barracks for

the Egyptian troops in the Sudan, and various commercial matters.

At the Fifth International Anti-Locust Conference held in Brussels in 1938, the Anglo-Egyptian Sudan was asked to appoint representatives to the single committee appointed to supervise and control the locust species in Africa.

The Inter-Territorial Conference on Higher Education met at Makerere (Kampala), Uganda, in May and the Sudan sent an observer. The conference decided that the Makerere site be used for the higher college. Egyptian troops received a warm welcome when they returned to the Sudan in 1938 after an absence since 1924. See EGYPT under History.

ANGOLA (PORTUGUESE WEST AFRICA). A Portuguese colony in central Africa. Area, 487,788 square miles; population (1936 estimate), 3,250,000 as compared with (1934), 3,225,015, including 58,098 Europeans and 19,872 half-castes. Chief towns: Nova Lisboa (capital designate), Loanda (capital), Benguela, Mossamedes, Lobita, and Malange. For educational purposes there were 70 primary, 3 secondary, and 106 professional schools.

Production and Trade. The production of chief crops, in 1936-37, in metric tons, was: Wheat, 1900; maize, 199,600; cane sugar, 29,300; tobacco, 2500; cotton seed, 1400; sesame, 400; groundnuts, 1000. It was estimated that 17,000 metric tons of coffee were produced in 1937-38. In 1936, 600 metric tons of palm oil and 1800 metric tons of palm kernels were exported. Other products are sisal, cacao, and wax. Livestock in the country (1931): 1,569,849 cattle, 363,252 goats, 286,784 swine, and 150,485 sheep. Rich deposits of diamonds exist and 483,448 carats were exported during 1933. Copper, lignite, and salt are found. In 1937 the estimated value of merchandise imports (in old U.S. gold dollars) was \$4,700,000 (1936, \$3,900,000); exports, \$10,200,000 (1936, \$8,200,000). Textiles, foodstuffs, and coal are the main imports; diamonds, maize, coffee, wax, and coconuts are the principal exports. Trade is mainly with Portugal.

Communications. In 1937 the length of railway line open for traffic totaled 2080 miles. There were 37,928 miles of roads, 5790 miles of telegraph lines, 259 miles of telephone lines, and 19 wireless stations.

Government. In 1937 the ordinary budget balanced at 213,834,000 angolares (angolar averaged \$0.0448 for 1937). On Dec. 31, 1937, the public debt was 836,228,873 escudos. Angola, according to a decree of May, 1934, was divided into 5 provinces and 14 administrative districts. A governor-general heads the government. Governor-General, Col. António Lopes Mateus.

History. In 1938 a military mission was sent to Angola and the need for a modern defense organization was found vitally necessary by Portugal. During July and August, President Carmona of Portugal paid an official visit to Angola. See PORTUGAL under History.

ANHALT. See GERMANY.

ANNAM. See FRENCH INDO-CHINA.

ANNELIDS. See ZOOLOGY.

ANNUNZIO, àn-nōon'dzē-ō, GABRIELE D'. An Italian novelist, dramatist, poet, and soldier, died at Gardone Riviera, Italy, Mar. 1, 1938. Born in Pescara, Italy, Mar. 12, 1863, the son of Don Francesco Paolo d'Annunzio and Donna Luisa de Benedittis, he was sent to the College of Prato in Tuscany at the age of 16, and in the same year (1879) published his first book of verse,

Primo vere. This was followed by *Terra vergine*; *Canto novo* (1882) and *Intermezzo di rime* (1884).

Joining the *Tribuna*, some of his best work was contributed to that paper under the pseudonym "Duca Minimo," and at this time he published *Il libro delle vergini* (1884). In 1898, the English translation of his first novel, *Il piacere* (1889), *The Child of Pleasure* was published and it, together with *Le vergini delle rocce* (1897); *The Virgin of the Rocks*, (1899), and *Il trionfo del morte* (1894; *The Triumph of Death*, 1897), established him as a writer of prose and confirmed his reputation as a searching psychological writer.

During the following years his literary ideals seemed to undergo an interesting evolution. Grouping together his earlier novels, *Il piacere*, *L'innocente*, and *Il trionfo*, as the *Romances of the Rose*, he conceived the idea of a triple trilogy, the second and third groups to be respectively known as the *Romances of the Lily* and *Romances of the Pomegranate*. The first of the "Romances of the Lily" was *Le vergini delle rocce*, and his *Fuoco* (1900; *Flame of Life*) the first of the "Pomegranate" series. The latter was an apotheosis of poetry, physical beauty, and sensual love and marks the beginning of a decline, more pronounced in his later novels, such as *Forse che sì forse che no* (1910).

D'Annunzio also turned his attention to the drama, which it was his unsuccessful ambition to restore to the grandeur and unity of the classic Greek tragedy. His first drama was *La città morta* (1898; *The Dead City*, 1900) for Sarah Bernhardt. This was followed by the tragedy *La gioconda* (1899; Eng. trans., 1901) for Eleanora Duse and *La Gloria* (1899), and the five-act tragedy *Franческа da Rimini* (1901; Eng. trans., 1902), which was played with great success by Mme. Duse, who for several years was closely associated with him. Much of his success on the stage was undoubtedly due to her interpretation of his work. They quarreled in 1890, and while she continued to act in his plays, their former friendship never was renewed. Other of his theatrical writings included *Il sogno d'un mattino di primavera* (1897), *Il sogno d'un tramonto d'autunno* (1898); *La figlia di Jorio* (1904); *La fiaccola sotto il moggio* (1905); *Le Nave* (1908), and *Fedra* (1909). In 1911 he composed in French *Le martyre de Saint Sebastian* which was produced in Rome in 1936 but withdrawn after protests from the Vatican.

In 1912 the author, harassed by financial difficulties, left Italy for France, where he resided until the outbreak of the War in Europe in 1914. His published works to 1912, except those already mentioned, included *San Pantaleone* (1886); *Isoteco*; *Chimera*; *Elegie romane*; *Poema paradisiaco*; Short Stories, *Novelle della Pescara* (1902); *Le laudi* (vol. i and ii, 1904), which contained his later lyrical work and was generally regarded as his finest achievement in poetry; *Più che l'amore*, a tragedy (1906); *L'orazione e la canzone in morte de Giosuè Carducci* (1907); *Le contemplazione della morte* (1912); *Vita de cola di Rienzi* (1912), and *Parisina* (1912).

Returning to Italy, he addressed a series of papers to the Italian people, *Per la più grande Italia* (1915), which were considered influential in causing the Italians to join the Allied forces. D'Annunzio, although 51 years of age, volunteered for active service, taking part in torpedo and submarine raids and later joining the flying force. He was promoted to the rank of lieutenant colonel and made an officer of the Military Order of Savoy. At the end of the War, embittered by the attitude

of the Allied leaders toward Italy at the Versailles Conference, he published a series of letters and papers entitled *Contro uno e Contro Tutti* (1919).

Understanding that the city of Fiume was to be administered by the League of Nations and not given to Italy, D'Annunzio gathered together a few hundred youthful Italian soldiers and set out on what became known as the March of Ronchi, Sept. 10-11, 1919, to capture the city, which was then policed by Allied military detachments. Winning over the Italian commandant, General Pitagala, who came out to war with him, he entered the city triumphantly. He was able to hold the city until 1920, when on November 20 Italy and Yugoslavia signed the Treaty of Rapallo making Fiume an independent sovereign State. He refused to submit to the Italian Government in enforcing the provisions of this Treaty and was finally overcame by the Italian Government and obliged to leave Fiume in January, 1921.

D'Annunzio held membership in the Italian Chamber of Deputies in 1898 and after the rise of Fascism embraced that political ideology. In 1924 when Italy formally annexed Fiume he received the title of Prince of Monte Nevoso for his services to the Government in attempting to establish Italy's eastern frontier. In the following year he was offered the Villa Falconiere outside of Rome by the Government but refused it, offering in turn his villa as a national monument, which he gradually turned into a war museum. In September, 1937, he was elected to succeed Marconi as president of the Royal Italian Academy and as such was an *ex officio* member of the Fascist Grand Council. In 1935 he was given the honorary rank of general in the air force.

His later works included *La Pisanella* (1913); *Le Chevreuille* (1914); *La Leda senza cigno* (1916); *La beffa di Buccari* (1918); *La riscossa* (1918); *Notturmo* (1919); *Per l'Italia degli Italiani* (1923); *Le faville del maglio* (1924); *Juvenilia* (1925); *Canto novo* (1925). In 1927 he began the compilation of a complete set of his works of almost 50 volumes, which was subsidized by the Italian Government. Most of the books were on the Catholic Index Expurgatorius, and with the publication of *Hundred and hundred and hundred and hundred pages of the secret book of Gabriele d'Annunzio tempted to die* (1935), which was largely autobiographical, this too was placed on the Index. Although considered inferior to his best work, it was found not without merit and typically D'Annunzian.

ANSCHLUSS. See AUSTRIA under History.

ANTARCTIC EXPLORATION. See POLAR RESEARCH.

ANTHROPOLOGY. General. The scientific tendencies of recent years continue, with no departures of note, save that the newer developments in all fields have come into increasing attention. This would apply to the study of growth and the life-cycle and use of X-ray techniques in physical anthropology; to increasing development of sociological and psychological studies in ethnology and social anthropology, as well as increased interest in acculturation and applied anthropology. Methodologically there is the tendency toward clearer statement of problems, and toward an integrated social science approach. Linguists continue to offer improved material on primitive languages, and to expand their research into as yet little-known areas. Archaeology continues its focal interest in early man in the Old World and the New,

prehistoric developments of human culture, and in better classification and analysis of materials from many areas.

The development of Fascism and Nazism abroad have had important impact on anthropology and anthropologists, embodying as they do a denial of scientifically established facts on man and race. Many German anthropologists were forced to leave their posts in earlier years. The recent mergence of Austria into Greater Germany has had similar repercussions in Austria, resulting in the disruption of the Vienna school of anthropology, led by Schmidt and Koppers, editors of *Anthropos*. The department has been disbanded. Schmidt went to Rome, and may continue to issue *Anthropos* from Italy. Koppers was dismissed and left for research in India. Schebesta went to Czecho-Slovakia. The impact of anti-semitism upon anthropological work increased. K. T. Preuss' *Lehrbuch der Völkerkunde* was withdrawn from circulation because of articles by Leonhard Adam. Wm. Muhlman's *Methodik der Völkerkunde* (Stuttgart, 1938) avoids reference to functionalists by name for political reasons. In Italy the development of anti-semitism as a state doctrine found anthropologists like L. Cipriani accepting and justifying it in the public press, though their past work could hardly prove anything but its opposite.

In America, along with scientists in other fields, anthropologists took increasing note of these tragic developments, and in public utterances of many kinds condemned the falsity of racialism. The American Anthropological Association at its annual meeting in December, 1938, unanimously adopted a resolution denouncing the use of racial falsehoods as political justifications and restating the simple facts on race which lend no support to discrimination or persecution in any form. At meetings of section H, Anthropology, of the American Association for the Advancement of Science, J. R. Swanton critically exposed the falsehood of racialism.

Among noteworthy events of the year were: The holding of the Second Session of the International Congress of Anthropological and Ethnological Sciences at Copenhagen in August; the opening of the Musée de l'Homme (the old Trocadero) in Paris, accredited as a remarkable research center, and one of the finest anthropological museums in the world; the founding of the Sociedad Mexicana de Antropologia in Mexico, evidencing the increase in Mexican and Latin American studies. In Mexico also a new Department of Anthropological Sciences was organized in the National School of Biological and Anthropological Sciences in Mexico City; and P. Kirchoff initiated proposals for a development of a Laboratory of Anthropology which could offer field training for Latin American research. The Arizona Anthropological Association was formed in Phoenix, and at Albuquerque a clearing house was established for southwestern museums of Colorado, Arizona, New Mexico, west Texas, and Southern California.

Several new serials began in America, including: *Anthropological Records* of the University of California for monographs of a documentary or record character; *Material Culture Notes* of the Ethnographic Laboratory of the Denver Art Museum; *New Mexico Anthropologist* of the University of New Mexico, now issued in printed form; and the forthcoming *Monographs of the American Ethnological Society*.

Tribal distribution and handbook surveys increased. Eastern Oregon distributions were de-

scribed by V. Ray and others (*Amer. Anth.*, 40: 384-415), Great Basin by W. Z. Park and others (idem, 622-638). D. S. Davidson issued a register of Australian hordes and tribes (American Philosophical Society) and an ethnic map of Australia (*Proc. Amer. Phil. Soc.*, 79, no. 3) which was the first since that of Curr in the 1880's. W. D. Hamblin's *Source Book for African Ethnology* (Field Museum of Natural History, 2 v.), and J. G. Frazer's *Native Races of Africa and Madagascar* (London), edited by R. A. Downie, were noteworthy. Latin American research was advanced by continued publication of the *Boletín Bibliográfico de Antropología Americana* of the Instituto Panamericano de Geografía e Historia of Mexico, and the *Handbook of Latin American Studies* edited by L. Hanke at Harvard University.

Among outstanding books were Franz Boas' revision of his epochal *Mind of Primitive Man* (Macmillan), bringing up to date research of a generation; and *General Anthropology* by F. Boas, R. Benedict, R. Bunzel, J. Lips, R. H. Lowie, J. H. McGregor, N. C. Nelson, and G. Reichard, which was the first systematic account of the whole field to appear in America (Heath). C. Wissler's third edition of *American Indian* (Oxford Press) brought linguistic classifications up to date and modernized its treatment of archaeological areas of the New World. Unfortunately, no account is taken in the revision of the progress of ethnological work of a decade.

The recent appearance of R. H. Lowie's *History of Ethnological Theory* (Farrar and Rinehart) stimulated methodological discussions. R. Linton discussed "The Present Status of Anthropology" (*Science*, 87:241-248) mainly with reference to archaeology and ethnology; and F. Boas "The Diffusion of Cultural Traits" (*Soc. Research*, 4: 286-295). Boas also discussed semantic problems in his "Anthropologist and Linguist." A. Lesser's "Problems versus Subject Matter as Directives of Research" stressed the necessity of orienting research from clear-cut problems and hypotheses if sterility and over-specialization are to be avoided.

Physical Anthropology. Growth and Related Problems. The problems of human growth continue increasingly important in physical anthropology. Anthropometric measurement is being more fully supplemented by X-ray study of maturation and an emphasis upon individual growth careers. Studies on the early years of life were numerous. K. Simmons and T. W. Todd showed that in well children from 3 months to 13 years stature is superior to weight as a measure of growth (*Growth*, 2:93-134); T. E. Raiford discussed the relationship between height and weight of infants two weeks to one year (*Human Biology*, 10:409-416); and H. Thompson found that "Bodily Proportions in the Growing Infant" (*Growth*, 2:1-12) are affected by factors from an indefinite number of sources. M. C. Hardy showed that frequent illness in childhood, when minor, if given immediate medical attention, has no permanent influence upon growth (*Amer. Jour. Phys. Anth.*, 3:241-260). R. M. Jenks and N. Bayley described a "Mathematical Method for Studying Growth of a Child" (*Human Biology*, 9:556-563); and C. B. Davenport offered an "Interpretation of Certain Infantile Growth Curves" (*Growth*, 1:279-283).

W. K. Krogman spoke of T. W. Todd's "Atlas of Skeletal Maturation in the Hand" as a milestone in use of X-ray methods. "For males age 3 months to 18 years 9 months, 40 standard X-ray photos are depicted; for females age 3 months to 16 years

3 months, 35 plates are shown. A table to equate the accelerated female standards with those of the males demonstrates the physical developmental precocity of the female." N. Michelson and W. Nussbaum continued X-ray study of maturation in the hand among Negro and white fraternities and found tempos in whites differing from those previously recorded. Michelson and Nussbaum are recording genealogical data to check "loss of ancestors" and attempt a correlation between the biological composition of the various groups and their psychological and mental manifestations.

The Society for Research in Child Development issued several important monographs. Greulich, Day, Lachman, Wolfe, and Shuttleworth's *Handbook of Methods for the Study of Adolescent Children* (Monographs, Soc. for Research in Child Development, 3, no. 2) outlines anthropometric, morphological, biochemical, physiological, metabolic, endocrinal, medical, and socio-psychological methods of study. Dearborn, Rothney, and Shuttleworth present *Data on the Growth of Public School Children* (idem, 3, no. 1); and Shuttleworth's *The Adolescent Period. A Graphic and Pictorial Atlas* (idem, 3, no. 3) offers curves and graphs for physical growth, skeletal development, sexual development, blood pressure, metabolism, health, intelligence, education, and socio-behavioral patterns. F. K. Shuttleworth described *Sexual Maturation and the Physical Growth of Girls Age Six to Nineteen* (idem, 2, no. 5). A. S. Beckham showed that city Negro boys and girls occupy a favorable position in weight and stature (*Human Biology*, 10:124-155). M. Steggerda and M. E. Grant reported statistically significant differences in growth of children of different races. S. D. Aberle described the growth of Pueblo children.

G. Wolff's "Tuberculosis and Civilization" (*Human Biology*, 10:106-123; 251-284) considered among etiological factors specific factors, heredity, socio-economic conditions, population, and medical prophylactics. J. C. Russell showed that "Length of Life in England, 1250-1348" (idem, 9:528-541) was shorter with a much higher proportion of persons under 40 and over 50. G. W. Beebe and C. J. Gamble discussed the "Effect of Contraception upon Human Fertility" (idem, 10: 372-387); and W. D. Wallis analyzed "Anatomic Lag" (*Child Development*, 9:87-121). M. F. Ashley-Montagu's "Aging of the Skull" (*Amer. Jour. Phys. Anth.*, 23:355-375) showed that, using suture closure and dentition as guides for age of the skull, adequate standards on normal skeletal material are approached only in the whites, with nothing exact known for other racial populations.

Race, Heredity, and Environment. In his "Heredity and Environment" (*Proceedings*, Int. Cong. on Population 1937, 83-92) Franz Boas found that "consideration of both the anatomical form and functions of the body, including mental and social activities, do not give any support to the view that the habits of life and cultural activities are to any considerable extent determined by racial descent."

Effects of changed environment on the body were studied by F. S. Hulse on immigrant and locally born Japanese in Seattle; and M. S. Goldstein (*Amer. Jour. Phys. Anth.*, 23:341-354) found that "the vault of the head in American-born Jews is appreciably greater than in the immigrant generation." J. Birdsall and N. Tindale studied Australian hybrids. W. D. Wallis (*Amer. Anth.*, 40:680-697) argued that the low variability found in some hybrid forms, as in Herskovits' work on the mulatto,

involved inadequate procedures and that most hybrids showed increased variability. B. S. Burk continued research for the Carnegie Institution on linkage of tooth deficiency and hair color, and of myopia and eye color.

Racial differences were studied by G. A. Seib (*Amer. Jour. Phys. Anth.*, 23:389-419) on the "M. Pectoralis Minor in American Whites and Negroes"; and by J. Dankmeijer (idem, 23:377-388) on fingerprints. S. D. Porteus' *Primitive Intelligence and Environment* (Macmillan) attempted to control environmental factors and establish innate differences between groups based on maze test performances. Porteus' treatment suffers from too narrow an interpretation of environmental factors as they affect performances. S. J. Holmes' *Negro Struggle for Survival* (Univ. of Calif. Press) was a thorough study of the physical problems faced by the Negro in America.

Anthropometrical Description. Attempts, such as that of Kretschmer, to classify body types were called in question by work of Stevenson, Sung, Pai, and Lyman on Chinese constitutional differentiation (*Human Biology*, 9:451-482); and Dearborn and Rothney (*Growth*, 2:197-212) who asserted that individuals cannot be accurately classified into body types. C. J. Connolly's *Physique in Relation to Psychosis* (Studies in Psychology and Psychiatry 1938) was a sampling of 100 cases as a test of Kretschmer's theory.

Descriptive studies included: M. J. Herskovits, "Physical Types of West African Negroes" (*Human Biology*, 9:483-497); D. J. H. Nyessen, "Racial Types of the Malay Archipelago" (*Amer. Anth.*, 40:341-344); C. T. Nelson, "Teeth of Indians of Pecos" (*Amer. Jour. Phys. Anth.*, 23:261-293); A. Hrdlicka, "Femur of Old Peruvians" (idem, 23:421-462). In research J. L. Angel worked on ancient Greeks; H. Field on Iran; J. M. Andrews on Siam; G. Seltzer on Syrians; W. D. Hambly on the Ovimbundu of Angola, Africa; C. Coon on South Arabic natives. G. Woodbury studied Basket Maker crania; and C. Seltzer physical types of Pecos River, Texas. C. Coon completed a revision of Ripley's *Races of Europe*.

W. Krogman reported that at Alishar Huyk, Anatolia, "the South European, or Mediterranean, longheads were basic to the southern half of Eurasia. The Central European, or Alpine, roundheads came in during the 24th century B.C., yielding in the 12th century to Phrygians of Mediterranean type." Though the Armenoid type was in Syria as early as 500 B.C., it does not appear at Alishar until the 11th century A.D.

L. Cipriani and C. Massari of Italy investigated populations of Eritrea; and L. Tegli of Italy studied castes and tribes of Southern India.

Linguistics. The anthropological approach treats language as a part of culture, fundamental to thorough social or psychological research. As yet, the bulk of research is in observing and recording languages of primitive peoples, viz., peoples who lack the art of writing, and recent advances are predominantly in phonemic techniques of transcription and analysis, developed under the inspiration and guidance of Edward Sapir. The anthropological interest in the origins and history of man has led linguists also to deal with historical problems of the relationships between languages, the reconstruction of families and stocks, and the temporal order of differentiation of languages and dialects. The use of linguistic methods in field study of culture has come to increasing attention. Made fundamental in early work of Franz Boas, the emphasis

continues into as recent a work as B. Malinowski's *Coral Gardens and Their Magic* in which field-work methods with reference to language are re-examined. The Group for American Indian Linguistics in America has continued to hold meetings of eastern and mid-western sections throughout the year, and discussions show increased attention to semantic and logical problems of language. Of special importance was the inauguration of a *Bibliography of American Linguistics in Language* (14, no. 4), which will hereafter appear annually.

As heretofore, the bulk of American attention has gone into languages of the American Indian. Research included: Algonquian (C. F. Hockett, M. Swadesh, J. A. Geary, T. Michelson); Eskimoan (M. Jacobs); Athapaskan (H. Hoiyer, J. P. Harrington); Iroquoian (M. Swadesh); Siouan (C. F. Voegelin); Muskogean (M. Haas); Wakashan (M. Swadesh, E. Sapir); Kalapuyan (M. Jacobs); Shoshonean (B. Whorf, D. Shimkin); Piman (G. Herzog); and Yuman (A. Halpern). M. J. Andrade continued work on Mayan.

American Indian grammars included: C. C. Uhlenbeck, *Concise Blackfoot Grammar* (Amsterdam, 1938); and in volume iii of the *Handbook of American Indian Languages*, edited by Franz Boas, Tonkawa (H. Hoiyer), Quileute (M. Andrade), Yuchi (G. Wagner), Zuni (R. Bunzel), and Coeur d'Alene (G. Reichard). Text publications were H. Hoiyer's of Chiricahua and Mescalero Apache (Univ. of Calif., 1938), B. Haile's of Navaho (*Yale Univ. Pub. Anth.*, 17), and E. Sapir and M. Swadesh's Nootka. Vocabulary studies included: R. J. Hunt's "Mataco-English and English-Mataco dictionary" (*Ethnol. Studies*, 5:1-98); and M. E. Bercera's vocabulary of Chol (*Anales, Museo Nacional de Arqueologia, Historia y Etnografia*, 2, 5th epoca, 249-278). E. Lewy discussed the Quiché of Guatemala (*Anthropos*, 32:929-958). C. F. Voegelin considered the "Direction of Linguistic Change" in Algonkian (*Proc., Indiana Acad. Sci.*, 47:48-49) and analyzed Shawnee stems (Indiana Hist. Soc., Prehistory Research Series 1, no. 5); M. R. Haas, "Geminate Consonant Clusters in Muskogee" (*Int. Jour. Amer. Linguistics*). C. Loutkotko discussed "La Familia Linguistica Corado" (*Jour. Soc. of Americanists*, 29:157-214), and J. A. Mason, *Current Opinions on the Groupings of Middle American Languages*.

The study of African languages has been greatly stimulated by work of the International Institute of African Languages and Cultures of London and Paris. French dissertations included those of M. Leiris on the secret language of the Dogon, and D. Lifszyc on religious texts from Abyssinia. In English appeared J. P. Crazzolara, *Study of Acoli* (London), J. Lukas, *of the Kanuri* (London), D. M. Beach, *Phonetics of the Hottentot* (Cambridge, 1938), H. Melzian, *Dictionary of the Bini of Southern Nigeria* (London, 1937), and I. Schapera, "Texts in Boloongwe Dialect of Sekgalagadi" (*Bantu Studies*, 12, no. 3, 1938). L. E. Armstrong's *Phonetic Structure of Kikuyu* and A. N. Tucker's *Eastern Sudanic Languages* were in press. In this country appeared M. H. Watkins, *Grammar of Chichewa*, a Bantu language of British Central Africa (Linguistic Soc. of Amer., *Dissertations*, 24).

Studies of Australian languages continued to appear in Oceania. Under A. P. Elkin's editorship was published *Studies in Australian Linguistics* (Oceania Monographs, 3). C. De Goeje of Holland studied the Oayana of Surinam.

Archaeology. Early Man. Further discoveries

in China, Java, and Africa necessitated reconsiderations of points of view on early man in the Old World. Three new *Sinanthropus* skulls were reported from the region of Peiping in China. F. Weidenreich, in discussing the "Relation of *Sinanthropus Pekinensis* to *Pithecanthropus*, *Javanthropus* and *Rhodesian Man*" (*Jour. Royal Anthropological Institute*, 67:51-65), said the *Sinanthropus* forms foreshadow the Neanderthal type and suggest possible connections with later mid- and late-pleistocene finds of Java. Weidenreich also compared "*The Dentition of Sinanthropus*" (*Paleontologia Sinica*, 101, n.s.D 1, 2 v.; Geological Survey of China, 1937) with that of all other known fossil forms. A third *Pithecanthropus* skull from Java differed from the other two and approached *Sinanthropus* in some cranial features. The newer evidence from Java suggests that the original cranium and femur of the first *Pithecanthropus* found do not belong together, the femur being later and more advanced anatomically.

Broom found at Komdraai in South Africa four large ape skulls with human-like dentition, probably from mid-pleistocene, and later than the Taungs ape form recently found. On the basis of these ape forms and human forms from Africa, Broom suggests a possible South African origin of man from an African pliocene form of about 3,000,000 years ago.

W. M. Krogman recently summarized work of the past few years on early man in America:

The problem of the "Folsom complex" has been considered among others by Roberts, Howard, Antevs, McClintock, Shetrone, Bryan, Harrington. At Folsom, New Mexico, the dating is probably to a period when glaciers larger than at present still lingered. Clovis, New Mexico, is dated by Antevs 12,000 to 13,000 years ago; Lake Mohave, California, to 15,000 years; Cochise, Arizona, to over 10,000 years ago. Dating at Lindenmeier site in Colorado is more unsettled, but the site is probably much later. Folsom material dates to the pluvial period following retreat of the last glacier. At Borax Lake, California, Harrington found man present before and during formation of an alluvial fan of post-glacial pluvial period. An early culture of the "Silver Lake" type of Lake Mohave was found to precede the Folsom type.

With respect to dating of man by associated faunal remains Colbert, Darbour and Schultz found man contemporaneous with the following forms now extinct: horse, sloth, giant beaver, mammoth, four-horned antelope, and several bovids and camelids. Colbert accepts that of these forms horse, camel, sloth, mammoth "persisted until a few thousand years ago."

Human remains associated with the Folsom complex are questionable. Jenks reports from Brown's Valley, Minnesota, a long-headed Amerind type, of ca. 8-12,000 years ago, associated with blades of an intermediate "Yuma-Folsom" type.

In 1935 Jenks advanced the claim for North America "Pleistocene Homo" found in glacial Lake Pelican of ca. 20,000 years ago. Jenks stated the type to be a primitive Mongoloid (possibly pre-Eskimoid). The age of the find has been questioned by Antevs. The type has been challenged by Hrdlicka, who feels it is preferable to a recent Sioux female. In 1938 Howells reported from Wyoming four crania similar to the Minnesota type and substantiating in part Jenks' assertion of primitiveness.

J. Bird found traces of Folsom and other early horizons in Manitoba and Saskatchewan. L. Cressman found in eastern Oregon cave sites remains of an early culture estimated at from 5000 to 15,000 years old. In South America, J. Bird studied inland cultures of Tierra del Fuego which flourished 5000 years ago when native horse and sloth still persisted.

Old World Prehistory. Gradually the prehistoric horizons and the interrelationships of prehistoric cultures of Asia are being worked out, particularly as regards conditions in India, Burma, Java, and China. The paleolithic Soan cultures of Northwest India were further excavated by D. Sen of Calcutta. H. de Terra, who established the

Early Stone Age chronology of Northern India, found and dated in Irrawaddy Valley and the Shan States of Upper Burma a sequence of Lower Paleolithic, Upper Paleolithic, and later cultures, the last with polished stone tools and hand-made pottery. Ancient implements from the gravel terraces resemble the Indian Soan cultures, characterized by absence of hand axes. The Burmese tools, however, are cruder than the Indian, and are typologically related to the Choukoutien ancient horizon in China and the old Paleolithic of Java. This suggests a wide Asiatic distribution of a new Paleolithic tool of complex type fundamentally different from types of Europe or Africa. The Paleolithic of Europe and Africa involve tool types which are basically form-conscious; while the Choukoutien and related types from Asia are essentially without form-consciousness of the same degree and suggest rather an attention to functional use regardless of perfected form. The expedition of the Carnegie Institution, led by de Terra, visited Java for possible correlations with Burman-Indian conditions.

D. E. Garrod and D. M. A. Bate's *Stone Age of Mt. Carmel* (New York) showed that paleolithic horizons as revealed in excavations in Palestine are less sharply defined than in western Europe. Successive industries, however, essentially resemble their west European equivalents. Explorations of M. Waterlot in northwestern Africa resulted in discovery of an Acheulean paleolithic phase over a wide area of southern Mauretania, as well as numerous neolithic workshops. Recent work on conditions in south Africa was discussed in P. Sohng, O. J. Visser, and C. van R. Lowe, "Geology and Archaeology of the Vaal River Basin" (Geological Survey, Dept. of Mines, South Africa, *Memoirs*, 35); and A. J. H. Goodwin and others, "Archaeology of Oakhurst Shelter, George" (*Trans., Royal Soc. of So. Africa*, 25, part iii).

American Archaeology. J. Steward and F. M. Setzler's "Function and Configuration in Archaeology" (*Amer. Antiquity*, 4:4-11) discussed recent methodological questions. C. Wissler's third edition of *American Indian* (New York, 1938) presented an up-to-date summary of archaeological areas and cultures of the New World.

In the Plains, efforts to link prehistoric sites and historic cultures continued. E. H. Bell and A. T. Hill worked in Nebraska on protohistoric Siouan, prehistoric Upper Republican, and Woodland sites. W. R. Wedel surveyed Kansas. E. B. Renaud described the "Black's Fork Culture of Southwest Wyoming" (*Archaeol. Survey of High Western Plains*, 10, Denver, 1938). Sayres studied Yellowstone River horticultural sites in Canada, probably attributable to early Crow. An expedition from Columbia University under W. D. Strong (R. Elder, M. Hauben, J. Jablow, A. Mitchell, E. Milligan, S. Sameth, C. Smith) excavated protohistoric Cheyenne sites in eastern North Dakota and Mandan sites on the Missouri. Earlier sedentary conditions of the Cheyenne, who, in historic times, were a nomadic hunting people of the Plains, are clearly established by this work.

In Texas, F. Setzler showed that the Big Bend cave dweller culture, a non-ceramic, non-agricultural horizon, extended to the Great Bend Region of the Rio Grande.

The relations between "Ethnology and Archaeology in the Southwest" were discussed by E. C. Parsons. The manner in which ethnological and archaeological work mutually supplement one another in understanding the history and culture of the

southwest is becoming increasingly clear. Technical studies on southwestern problems included: J. Gillin, "Method of Notation for Description and Comparison of Southwestern Pottery Sherds by Formula" (*Amer. Antiquity*, 4:22-29); F. M. and F. G. Hawley, *Classification of Black Pottery Pigments and Paint Areas* (Univ. N. Mex. Bulletin, 321); H. S. Colton and L. L. Hargrave, *Handbook of Northern Arizona Pottery Wares* (Museum of Northern Arizona, Bulletin, 11); and G. C. Baldwin, "Basket Maker III Sandals from Northeast Arizona" (*Amer. Anth.*, 40:465-485). W. S. Glock's *Principles and Methods of Tree-ring Analysis* (Carnegie Institution, no. 486) was a basic primer; and W. S. Stallings, Jr., brought tree-ring chronology of the Rio Grande from 870 A.D. to the present.

Reports on excavations completed and work in progress included: J. Brew on ancient Hopi sites; P. Reiter on Jemez pueblo (Univ. N. Mex., *Bulletin*, Monograph series 1, 3, 4, 5); H. P. Mera on southeastern New Mexico (*Amer. Anth. Asso., Memoir*, 51); W. S. Fulton on Texas Canyon, Arizona (Heye Foundation, *Contributions*, xii, 3); P. S. Martin on Ackmen-Lowry area of southwestern Colorado (Field Museum of Natural History, Anthropological series 23, no. 2:219-304); J. Gillin on Nine Mile Canyon, Utah (Univ. Utah, *Bulletin*, 28, 11); and H. S. Gladwin, E. W. Haury, E. B. Sayles, and N. Gladwin on Snaketown (Medallion Papers, 25, 26).

Work of San Diego Museum revealed artifacts in San Diego County, California, 16 feet beneath a camp of historic aborigines (San Diego Museum, papers, 3), constituting evidence of the greatest antiquity of man on the Pacific Coast yet discovered.

University of Oklahoma co-operating with WPA continued excavations in Oklahoma. Horizons there show that western Oklahoma is anciently linked with the Southwest, and eastern Oklahoma with general eastern areas. Southwestern links include: Basket Maker II traits, weaving, metates, but no corn or pottery, are found in caves and shelters of western Cimarron River regions; while in the Panhandle are found four-posted sub-rectangular pit houses, earth-covered, with plain or cord-padded pottery, remains of corn, and bison and deer bones. The Great Spiro mound reveals eastern affinities.

In the Southeast, Webb and Lewis excavated sites soon to be flooded by development of the TVA, including large village sites of the horticultural period. Beneath horticultural horizons they found two non-agricultural levels, one with bone and stone work and antler dart throwers, and a deeper and earlier level with bone projectile points alone. Reports included: A. R. Kelly on Macon, Georgia, excavations (Bureau of American Ethnology, *Bulletin*, 119:1-68); W. S. Webb on Norris Basin, eastern Tennessee (idem, 118); W. K. Moorehead and others on Susquehanna River areas (Andover, 1938); and W. A. Ritchie's "Perspective of Northeastern Archaeology" (*Amer. Antiquity*, 4:94-113).

Extensive work continued in Mexico and Central America under the auspices of Carnegie Foundation, American Museum of Natural History, National Geographic Society, Bureau of American Ethnology, University Museum, Harvard University, Tulane University, and other institutions. The connections of northwest Mexico with southwest and higher centers of culture are still undetermined. Work was begun in Vera Cruz near Oaxaca, re-

gion of the little-known Olmec, an early pre-Aztec people. S. K. Lothrop found the "Southeastern Frontier of the Maya" (*Amer. Anth.*, 41:42-54) defined by Copan in northern Honduras. J. A. Mason surveyed the problems of Mexican and Middle American archaeology (*Amer. Antiquity*, 3:206-225; 300-318). Monographs of note were: S. K. Lothrop, "Coclé, an Archaeological Study of Central Panama" (Peabody Museum, Harvard, *Memoir* 7); W. D. Strong, A. V. Kidder II, A. J. D. Paul Jr.'s preliminary report on work in northwestern Honduras (Smithsonian Miscellaneous Collections, 97, no. 1); E. H. Thompson, "High Priest's Grave, Chichen Itza, Yucatan" (Field Museum of Natural History, Anthropological Series 27, no. 1). Shorter studies included: G. Vaillant, "Correlation of Archaeological and Historical Sequences in the Valley of Mexico" (*Amer. Anth.*, 40:535-573); and L. Satterthwaite, "Maya Dating by Hieroglyph Styles" (*Amer. Anth.*, 40:416-428).

The higher centers of culture in western South America were extensively surveyed and studied. Work included research by H. J. Spinden (Colombia, Ecuador, Peru, and Bolivia), H. Doering of Munich (coastal Peru); H. Diesselhoff of Berlin (coastal Ecuador); W. C. Bennett (Peruvian islands); A. V. Kidder II (Peruvian and Bolivian highlands); S. Ryden of Stockholm (Bolivia). Bennett showed that early coastal Chavin type of pottery from Peru was part of the sequence in the Peruvian highlands. S. K. Lothrop published "Gold and Silver from Southern Peru and Bolivia" (*Jour. Royal Anthropological Institute*, 67:305-325). H. W. Krieger continued work in the Virgin Islands; B. I. Rouse in Puerto Rico.

Ethnology and Social Anthropology. Field Research. Field research on native peoples continued extensive, with increasing tendencies toward concentration in the field upon specialized problems, rather than general ethnography, although a great deal of descriptive reporting continues. The main research work of the year has been carried on by American, English, French, Australian, Scandinavian, and Indian scientists.

North American Indian research included: Montagnais (R. Flannery) of the northern Woodlands; Winnebago (L. Srole) of the Great Lakes area; Blackfoot (J. Richardson, D. Collier, J. M. Cooper), Cree (D. Collier), Dakota (D. Collier), Arikara (P. Holder), Hidatsa (J. Landgraf), Crow (D. Collier), and Osage (W. Whitman) of the Plains; Seminole (A. Spoehr) of the southeast; Northwest Coast tribes of British Columbia (P. Drucker); Modoc (W. Ray), Oregon Paiute (B. B. Whitney), Kalispel (A. H. Smith, J. M. Cooper), and other tribes of Washington and Oregon (M. W. Smith); Kawaiisu (M. L. Zigmund), Washo (E. E. Siskin, O. C. Stewart), Paiute (O. C. Stewart), Chukchansi Yokuts (B. Thrall), Hupa, Yurok, and Karok (H. Barnett) of California; Santa Ana (L. White), Navajo (M. Carr, C. Kluckhohn, H. Tschopik), Hopi (C. Kluckhohn, E. Kennard), Papago and Yuma (J. M. Cooper) of the Southwest.

In Mexico, G. Stresser-Pean and M. Halpern of France were among the Huastec and Tarascans, respectively. J. Mirsky was in Guatemala, and W. von Hagen among the Miskito of Honduras.

South American research included: In Brazil, Levi-Strauss and Velard from France among the Nyambikwara of Matto Grosso; C. Nimuendaju among Kamukan; W. Lipkind on Caraja; B. Quain on Trumai; and R. Landes on Negroes of

Bahio. B. Mishkin worked in Peru; W. Z. Park among Kagaba of Colombia; and P. Sangnier among Rio Maroni natives of French Guiana.

Research was extensive in Africa, mainly under the direction of the International Institute of African Languages and Cultures of Paris and London. Investigations included work of: M. Galal (Nilotic tribes of Sudan), M. Lhote (Touareg of Sahara), L. Cipriani of Italy (northern Eritrea), M. Labouret of France and J. Harris of U.S. (Nigeria), J. Greenberg (Hausa), W. R. Bascom (Yoruba), G. Bolinder of Sweden (Kpweesi of Liberia), L. Mair (Baganda), G. Wagner (Bantu Kavirondo of Kenya), G. B. Wilson (Nyakyusa of Tanganyika), M. Read (Nyasaland), J. D. Krige (Balobedu of northern Transvaal), H. Kuper (Swazi of Swaziland), and Z. K. Matthews (Barolong of Bechuanaland). J. Faublee worked in Madagascar.

K. P. Chattopadhyay of India studied the Santals, and the Korkus of the Melghat forests in Central Provinces; and J. K. Bose worked on the Plains Garos; Mlle. Gomes of France also did research in India. From the U.S., D. Mandelbaum was among Khota and Badaju; G. T. Bowles in Tibet; and A. E. Hudson among Turcomans of Iran. O. Janse and K. G. Isikowitz of Sweden studied natives of Indo-China, the latter Lamet mountain tribes; and Cuisinier and Delmas of France were among Muong and also in Annam.

Indonesian research was more extensive including: Bali (M. Mead, A. Kistner); Timor (C. Du Bois, M. M. Nicolspeyer, P. P. Arndt, B. A. G. Vroklage); and Borneo (R. Blomberg). M. Mead was in Sepik River region and G. J. Held in Wapopen district of New Guinea; D. L. Oliver in Bougainville of Solomon Islands. From Frankfurt, Germany, an expedition went to the Moluccas and New Guinea. Interest in Indonesian research was focused by the Congress of students of Balinese culture in Bali in 1937.

Extensive research in Australia was carried on by ethnologists of the University of Sydney. A Northwest Australian Expedition from Germany began extended research. A. Leroi-Gourhan of France carried on research in areas of Japan. C. Osgood of U.S. studied a Chinese village in Yunnan.

Publications. Studies of the American Indians included: K. Birket-Smith and F. de Laguna's *Eyak Indians of the Copper River Delta, Alaska* (Copenhagen, 1938); C. Osgood's on the Tanana (Yale University Publications, 16); G. A. Nomland's "Bear River Ethnography" (*Anthropological Records*, 2, no. 2); P. Drucker's "Tolowa and Their Southwest Oregon Kin" (Univ. Calif. Publications, 36, no. 4); E. W. Voegelin's on Tubatulabal (*Anthropological Records*, 2, no. 1); and W. Cline's and others on "Sinkaietk or Southern Okanagon of Washington" (General series in anthropology, 6). Culture element distribution studies were issued for southern California (P. Drucker), southern Sierra Nevada (H. E. Driver), and the Oregon Coast (H. G. Barnett), (*Anthropological Records*, 1, nos. 1, 2, 3).

On peoples of Latin American areas appeared: B. Bevan, "Chinantec" (Institut. Panamericano de Geogr. e Hist.); J. Soustelle, "La Famille Otomipame" (*Trav. et Memoires de l'Institut d'Ethnologie*, 26) and "La Culture Materielle des Indiens Lacandons" (*Jour.*, Society of Americanists, 29:1-95); H. Wassen, "Original Documents from the Cuna Indians of San Blas, Panama" (*Ethnologiska Studier*, 6:1-178); H. Cunow, *Geschichte*

und Kultur des Inka-Reiches (Amsterdam); and volume ii of M. Gusinde's "Die Feuerland Indianer" on "Die Yamana; vom Leben und Denken der Wassernomaden am Kap Hoorn" (Vienna). Of note also were C. Nimuendaju's "Gamella Indians" (*Primitive Man*, 10:nos. 3-4); F. Taylor's *Caribs of Dominica* (Bulletin 119, Bureau of American Ethnology, 103-159); A. Serrano's *La Etnografia antigua de Santiago del Estero y la Llamada civilizacion Chaco-Santiaguena* (Paraná, Argentina, 1938); and M. W. Stirling's *Historical and Geographical Material on the Jivaro Indians* (Bulletin 117, Bureau of Amer. Ethnology).

Polynesian reports appeared on Pukapuka (E. and P. Beaglehole), Mangareva (P. H. Buck), Easter Island (A. Metraux) (B. P. Bishop Museum, Bulletins 150, 157, 160). A. W. Lind described *An Island Community: Ecological Succession in Hawaii* (University of Chicago Press). M. Mead described "The Mountain Arapesh I. An Important Culture of New Guinea" (Anthropological Papers, American Museum of Natural History, 36, pt. iii), and shorter New Guinea studies included L. G. Vial's on the Morobe district (*Oceania*, 8: 383-397), and A. Schaefer's (*Anthropos*, 33:401-423). In Oceania appeared numerous shorter papers of note on Melanesian and Australian peoples by A. P. Elkin, P. M. Kaberry, C. H. Wedgwood, I. H. Hogbin, and others. R. Thurnwald's "Ein Vorkapitalistisches Wirtschaftssystem in Buin" (Archiv für Rechts- und Sozialphilosophie, 31, 1-37) was noteworthy. D. S. Davidson discussed "Northwestern Australia and the Question of Influences from the East Indies" (*Jour.*, Amer. Oriental Soc., 58, no. 1).

Major African monographs included M. J. Herskovits, *Dahomey* (2 v., N. Y., 1938), a rich and comprehensive study; I. Schapera's *Handbook of Tswana Law and Custom*; C. K. Meek's *Law and Authority in a Nigerian Tribe*, and M. J. Field's *Religion and Medicine of the Ga People* (Oxford Press). L. F. Nalder edited a *Tribal Survey of Mongalla Province* (Oxford Press); D. Westerman's revision of his *The African Today* was in press; and A. I. Richards' *Land, Labor and Food in Northern Rhodesia; An Economic Study of the Bemba Tribe* was forthcoming. Studies of the Laboratory of Ethnology in Paris included a series of treatments of aspects of the little-known Dogon of Sanga by S. de Ganay, G. Dieterlen, D. Palme, M. Griaule, and A. Schaeffner. Other French studies completed on African groups were by T. Riviere, G. Tillion, and P. Mus. E. Charles and C. D. Forde offered population data on a southern Nigerian village (*Sociol. Rev.*, 30:145-160); and S. F. Nadel analyzed a fertility cult of the Nupe of Northern Nigeria (*Jour. Roy. Anth. Inst.*, 67: 91-130).

Descriptive studies of Asiatic peoples included: E. S. Drower, *The Mandaeans of Iraq and Iran* (Oxford); G. Montell, *Durch die Steppen der Mongolei* (Stuttgart); and Y. Ching-Chi and others on the Yao in Northern Kwangtung (*Jour. Chinese Folklore*, Canton, 1938, 1, no. 3). On India appeared S. S. Sarkar, *The Malers of the Rajmahal Hills* (Calcutta) and D. N. Majumdar's *Tribes in Transition* (Calcutta) on the Munda. In shorter essays W. Y. Len described the Shanam boat people (*Nankai Soc. and Econ. Quar.*, 9, no. 4:807-854); V. A. Riasanovsky, "Customary Law of the Kirghiz" (*Chinese Social and Political Science Review*, 21, no. 2:221-67); and H. Stevenson food division among the Zahau Chins of Burma (*Jour. of Royal Anth. Inst.*, 67:15-32). Of note were

I. H. N. Evans, *Negritos of Malaya* (Macmillan); and M. Vanoverbergh's papers on the Negritos of Eastern Luzon (*Anthropos*, 32:905-928; 33:119-164). Hsiao-Tung Fei's *Peasant Life in China; Life in a Chinese Village Community* was a forthcoming functional study.

Technology and Material Culture. W. W. Hill described Navaho agricultural and hunting methods (Yale University Publications, 18); F. G. Speck skin-dressing techniques of Labrador (*Ethnos*, 2:345-353); W. W. Hill, Navaho pottery manufacture (*Bulletin*, Univ. N. Mex., Anthropological series 2, no. 3); A. Woodward, Navaho silversmithing (*Bulletin*, Museum of No. Ariz., 14); H. P. Mera, Navaho weaving (Laboratory of Anthropology, General series 2, 3, 5, 6); J. M. Cooper, Northern Algonquian and Athapascan traps (Catholic Conference of America, Anthropological series 5); and N. Joffe, *Patterns of Food Preservation among American Indians*.

In a general statement on *Methods and Scope of the Study of Material Culture*, G. Welfish pointed out the tendency to employ our own distinctions as to technique and materials, and showed the importance of approaching primitive technology and its role in economic life in terms of the native outlook on function and material.

Noteworthy was the posthumous appearance of Laufer's "The American Plant Migration, Part I. The Potato" (Field Museum of Natural History, Anthropological series 28, no. 1) edited by C. M. Wilbur.

Music and Folklore. Publications in primitive music included: G. Herzog's "Comparison of Pueblo and Pima Musical Styles" (*Jour. of American Folklore*, 49:283-417); F. Densmore's "Music of Santo Domingo Pueblo" (Southwest Museum Papers, 12); and C. Sachs, *World History of the Dance* (New York). Wyman and Kluckhohn described "Navaho Classifications of Their Song Ceremonials" (*Amer. Anth. Asso. Memoir*, 50). R. Underhill in *Singing for Power* (University of California) showed the place of songs in Papago religious life. F. Densmore described Maidu musical instruments (*Amer. Anth.*, 41:113-118); and C. Sachs instruments of Madagascar (*Trav. et Mém.*, l'Institut d'Ethnologie, 28).

Speck and Herzog worked on Cherokee dances and music; Herzog on Pima poetry. D. Woolley recorded Pima songs. Herzog discussed "Music in the Thinking of the American Indian" (*Pebody Bulletin*, May); and stressed the importance of an anthropological and sociological approach to the study of folksong (*Southern Folklore Quarterly*, 2:2:59-64).

Additions to material on American Indian folklore included: Thompson, by J. A. Teit (*Jour. of American Folklore*, 50:173-190); Coast Yuki, by E. W. Gifford (idem, 50:115-172); Jicarilla Apache, by M. E. Opler (American Folklore Society, *Memoir* 31); Mandan-Hidatsa, by M. Beckwith (idem, 32); Hopi, by M. Titiev (*Amer. Anth.*, 41:91-98); Navaho, by B. Haile (Yale University Publications, 1938); and Iroquois, by J. J. Cornplanter, *Legends of the Longhouse* (Philadelphia, 1938).

M. J. and F. S. Herskovits published "Tales in Pidgin English from Ashanti" (*Jour. Amer. Folklore*, 50:52-101); S. Sylvain-Comhaire, "Creole Tales from Haiti" (idem, 207-295); and S. Davidson and E. Phelps, "Tales from New Goa, India" (idem, 1-51).

Religion. W. Z. Park presented a thorough analysis of "Shamanism in Western North America:

A Study in Cultural Relationships" (Northwestern Univ. Studies in the Soc. Sci., 2). F. G. Speck continued documentation of "Oklahoma Delaware Ceremonies" (*Memoirs*, Amer. Philos. Soc., 7). F. Lambrecht completed presentation of "Mayaw-yaw Ritual" of the Philippine Ifugao (Cath. Anth. Conf., Pub., 4, nos. 1-3). B. Haile (*Amer. Anth.*, 40:639-652) and C. Kluckhohn (idem, 359-369) discussed Navaho ceremonialism. W. La Barre analyzed the "Peyote Cult" (Yale Univ. Pubs., 19); M. E. Opler discussed Apache use of peyote (*Amer. Anth.*, 40:271-285); and R. E. Schultes described its appeal as a medicine (idem, 698-715). Short studies included: C. Du Bois, "Feather Cult of Middle Columbia" (General series in anthropology); M. Lantis, "Whale Cult and Its Affinities" (*Amer. Anth.*, 40:438-464); and B. Coleman, "Religion of Minnesota Ojibwa" (*Primitive Man*, 10:33-57).

Economics and Sociology. M. J. Herskovits criticized the tendency to equate the merely technological or sociological with primitive economics and urged a broader economic viewpoint in ethnological research and publication. R. Bunzel proposed distinctions of economic types of social structure in terms of differences in modes of distribution. M. Edel described "Property Among the Ciga in Uganda" (*Africa*, 11:325-341). C. Wagley's "Economics of a Guatemalan Village" and B. Mishkin's "Land Tenure in an Andean Village" discussed effects of changing land conditions on social life. Of major importance was L. B. Simpson's "Studies in the Administration of the Indians in New Spain III. The Repartimiento system of native labor in New Spain and Guatemala" (*Ibero-Americana*, 13). Historical and sociological problems connected with use of the horse in North and South America came increasingly to attention as in studies by F. Haines (*Amer. Anth.*, 40:429-437) and M. W. Nichols (idem, 41:119-129). G. Landtman attempted to derive the "Origin and Inequality of the Social Classes" (Univ. Chi. Press) from non-economic factors, primarily personal and personality differences.

Social units and groupings were treated in A. E. Hudson's study of Kazak (Yale University Publications, 20); V. Garfield's "Tsimshian Clans" (University of Washington); and T. F. McIlwraith's work on Bella Coola. E. G. Burrows' "Breed and Border in Polynesia" (*Amer. Anth.*, 41:1-21) considered kinship versus territorial factors in Polynesian local group structure. R. L. Sharp discussed "Land as Totem in Northeast Australia" and C. W. M. Hart compared Australian hordes and American bands. J. M. Cooper found that the Algonquin family hunting ground system was essentially aboriginal and pre-Columbian (*Amer. Anth.*, 41:66-90).

Marriage and its problems were discussed in Hallowell's "Incidence, Character and Decline of Polygamy among Cree and Saulteaux" (idem, 235-256); Mandelbaum's "Polyandry in Kota Society" (idem, 574-583); and Rossignol and Flannery's studies of Cree cross-cousin marriage (*Primitive Man*, 11:26-28; 29-33).

Fortune's discussion of Arapesh warfare (*Amer. Anth.*, 41:22-41) criticized some aspects of Mead's interpretation of Arapesh behavior. K. Oberg showed how Banyankole kinship bonds were affected by British rule (*Africa*, 12:129-159). J. Richardson's "Status and the Prosecution of Crime among the Kiowa" showed that primitive legal procedure is affected by relative and absolute status of the litigants. M. W. Smith described the "War

Complex of Plains Indians" (*Proceedings, Amer. Philos. Soc.*, 78:425-464).

The application of anthropological methods of research to sociological problems of modern communities was carried forward at University of Chicago by W. L. Warner and staffs on Newburyport; Natchez; and Mexican and Negro communities in Chicago. Natchez contrasts with Newburyport in the addition of caste to class factors in the community situation. In studying Mexicans in Chicago, main attention is focused on the dynamic, changing social situation. The work on Chicago Negroes offers a contrast with the Negro situation in Natchez. Publications on these studies are forthcoming and should have marked influence on anthropological method and research.

Acculturation and Applied Anthropology. Problems of cultural impact, as descriptive inquiries, and as problems of administration of native peoples, received increasing attention here and abroad. In America, M. J. Herskovits discussed general questions of *Acculturation* (New York, 1938); and P. Nash and J. Gillin considered methods in the study of acculturation, the latter describing use of the life history approach. F. S. Cohen discussed "Anthropology and the Problem of Indian administration" (*Southwestern Soc. Sci. Quar.*, 18, no. 2). R. Linton edited a series of descriptions of American Indian acculturation, including Fox (N. Joffe), Shoshoni (J. Harris), Ute (M. Opler), Wailaki (A. Sussman), San Ildefonso (W. Whitman), Puyallup (M. Smith), Arapaho (H. Elkin), and Carrier (I. Goldman); D. Rodnick described acculturation of Montana Assiniboin (New Haven, 1938); K. Luomala of the Navaho (National Park Service). E. J. Lindgren discussed as "An Example of Culture Contact without Conflict: Reindeer Tungus and Cosacks in Northwestern Manchuria" (*Amer. Anth.*, 40:605-621); and M. B. Emeneau described "Toda Culture 35 Years After" (*Annals, Bhandarkar Oriental Research Inst.*, 19:101-121). F. Eggan completed preparation of "Culture Change among the Tinguian of Abra Province, Luzon, Philippines."

In England particular attention was given applied anthropology with relation to African native peoples and their administration. Many monographs of a general nature were in part directed toward that end. Three studies in particular (*Africa*, Memoranda xv, xvi, xvii) were devoted to applied anthropology. B. Malinowski, L. P. Mair, M. Hunter, I. Schapera, A. T. and G. M. Culwick, A. I. Richards, M. Fortes, and G. Wagner offered "Methods of Study of Culture Contact in Africa"; M. Read, "Native Standards of Living and African Culture Change"; and M. Fortes, "Social and Psychological Aspects of Education in Taland." In two contributions on "The Scientific Basis of Applied Anthropology" and "Modern Anthropology and European Rule in Africa" (Reale Accademia d'Italia, Rome, 1938), B. Malinowski "attempted to outline some of the basic principles of functional anthropology" and "to show that the functional method supplies a type of anthropology which covers the same ground, works on the same subject matter, and is interested in identical problems with which the practical man has to deal in Africa." In India, D. N. Majumdar, along similar lines, discussed "Tribal Cultures and Acculturation" (26th Indian Science Congress, Section vii, Lahore, 1939).

Culture and Personality. The year saw marked advances in work toward a psychological

and sociological approach to culture and personality. The Committee on Personality in Relation to Culture of the National Research Council surveyed possibilities of co-operative research in universities, medical schools, hospitals, etc. A sub-committee, under chairmanship of Edward Sapir, continued preparation of a *Handbook of Psychological Leads for Ethnological Field Workers*, and reported as ready an Introduction; the Life-Cycle; Economics; and forthcoming a section on utilization of time, space, and number concepts. Field research included that of J. Richardson, A. Maslow, and L. Hanks among Blackfoot, and L. W. Simmons among Hopi. Hallowell experimented with Rorschach methods among Berens River Indians. Abnormalities were treated in R. Landes, "Abnormal among Ojibwa" (*Jour. Abnormal and Soc. Psych.*, 33:14-33); W. W. Hill's note on Pima berdaches (*Amer. Anth.*, 40:338-340); and Devereux's "Institutionalized Homosexuality of the Mohave" (*Human Biology*, 9:498-527). Hallowell analyzed "Fear and Anxiety as Cultural and Individual Variables in a Primitive Society" (*Jour. of Social Psychology*, 9:25-47).

R. Benedict reported on Columbia University studies of "Culture and Personality" of recent years. In "Some Comparative Data on Culture and Personality with Reference to the Promotion of Mental Health" (*Proceedings, American Association for Advancement of Science*, December, 1938), Benedict showed that "the incidence of psychic breakdown on a wide scale bears some relation to specific cultural factors." Benedict's "Continuities and Discontinuities in Cultural Conditioning" (*Psychiatry*, 1:161-167) defined the difference between social structures which demand of the individual a sudden, radical change in behavioral adjustment and those which stress continuous and uninterrupted development of the individual's adjustment, and illustrated their effects. F. C. Bartlett discussed "Psychological Method and Anthropological Problems" (*Africa*, 10:401-420); and J. M. Reinhardt's *Social Psychology* (Chicago) stressed environmental factors. R. Linton's "Culture, Society and the Individual" (*Jour. of Abnormal and Social Psychology*, 33:325-436) suggested an approach to problems of culture and personality in terms of a distinction between culture and society. In Chicago, under the sponsorship of the American Youth Commission of the American Council on Education, research was inaugurated by W. L. Warner and a staff to investigate the effects of the Negro's minority status on Chicago in Negro personality.

ANTIGUA. See LEeward ISLANDS, BRITISH.

ANTI-LYNCHING BILL. See UNITED STATES under Congress; LYNCHING.

ANTIOCH COLLEGE. A nonsectarian, co-educational, liberal arts college in Yellow Springs, Ohio, operated on the co-operative plan of alternate work and study periods. The college was founded in 1853 and reorganized in 1920. The number of students enrolled for the autumn term of 1938 was 746, of which 475 were men and 271 were women. The faculty numbered 100. For the year 1937-38 the productive funds of the institution amounted to \$291,204, and the operating income was \$466,833. The library contains 54,000 volumes. President, A. D. Henderson, LL.B., M.B.A.

ANTI-SALOON LEAGUE OF AMERICA. A federation of church and temperance organizations in the United States whose object is the extermination of the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon

Leagues of four states and the District of Columbia. In 1937, to meet the changed situation resulting from repeal of national prohibition, the League's constitution was revised to place the major emphasis on state work and to enlarge the activities of the State Leagues in the states and local communities. At the end of 1938 it embraced 40 state or territorial Leagues, held membership in the National Temperance and Prohibition Council, and was affiliated with the World League against Alcoholism (q.v.).

During 1938 the organization's chief exertions have been directed toward the development of adequate scientific temperance education; legislative restrictions that will subordinate revenue to social considerations by measures tending to insure that the demand for alcoholic beverages shall be a progressively diminishing one; to prohibit the stimulation of sale and consumption of liquors by liquor advertising; to prevent the issuance of licenses in rural and inadequately policed territory or in excessive numbers, and to secure the right of the people under local option laws to express themselves upon legislative measures relating to the liquor traffic.

The officers in 1938 were: President, the Rev. J. R. Hobbs, Birmingham, Ala. (president-elect, Bishop Ralph S. Cushman, Denver, Colo.); vice-president, Andrew Wilson, Washington, D. C.; treasurer, Charles E. Coleman, Chicago, Ill.; secretary, George W. Crabbe, Baltimore, Md. The legal department and national headquarters are located at 131 B Street, S.E., Washington, D. C.

ANTI-SEMITISM. See JEWS.

APPENDICEAL PERITONITIS. See MEDICINE AND SURGERY.

AQUEDUCTS. Three great aqueducts were under construction during the year—all of them giant projects which set records in this type of construction and indicated the great advances of modern engineering in increasing man's mastery over his environment. These projects have all been described in earlier YEAR BOOKS. Progress during the year is here noted.

Colorado River. The tremendous task of constructing a 240-mile aqueduct, to carry water from the Colorado River to the Metropolitan District centering around Los Angeles, was about 90 per cent completed as the year came to a close. All major features of this project (see previous YEAR BOOKS) were expected to be completed in 1939 and water will then be delivered to the terminal storage reservoir (Cajalco) at the west end of the aqueduct. In the meantime, plans were completed to put the intake pumping plant, which takes water from the basin formed by the Parker Dam on the Colorado (see DAMS), in operation on Jan. 7, 1939. This plant will lift the supply 291 ft. to a 2-mile tunnel through which it will flow by gravity to the Gene Basin—one of the intermediate reservoirs on the aqueduct line.

The San Jacinto aqueduct tunnel, last of 38 tunnels, totaling 108 miles in length—the world's greatest tunneling project—was holed through on November 19. Inflows of water under high pressure and badly broken rock held up the completion of this work. Some 6 miles of the tunnel remain to be lined before the work can be put in service. It should be noted that whereas the Colorado River aqueduct proper leading to the terminal reservoir is 240 miles in length, the distribution system adds another 150 miles to the length of this great work. (See also TUNNELS.)

Delaware. The new Delaware supply for New

York City has also been under construction and many of the shafts for this work have been carried down to tunnel level. This entire line will be in deep-pressure tunnel and will tie up the new high-level sources of supply in the Western Catskills with the upper reservoirs of the older Croton system in Putnam County. Thus part of the Croton will be made available as a high-pressure supply.

Contracts for approximately 54 of the 85 miles of deep-pressure tunnel constituting the Delaware Aqueduct between Hill-View Reservoir near the City Line and the Lackawack Reservoir on Rondout Creek, amounting to about \$113,000,000, have been awarded and payments aggregating about \$13,000,000 have been made. Contracts for the remainder of this aqueduct, for the main dam on the Rondout Creek, and for the necessary highway relocation in the vicinity of the reservoir it is expected will be let early in 1939.

The first stage of construction, providing 170 m.g.d. from Rondout Creek and Neversink River, was estimated to cost about \$210,000,000. The second stage of construction, comprising the development of the East Branch of the Delaware River, from which an additional supply of 370 m.g.d. will be obtained, was estimated to cost about \$63,000,000 more, a total at the end of the second stage of approximately \$273,000,000. (See map on page 42.)

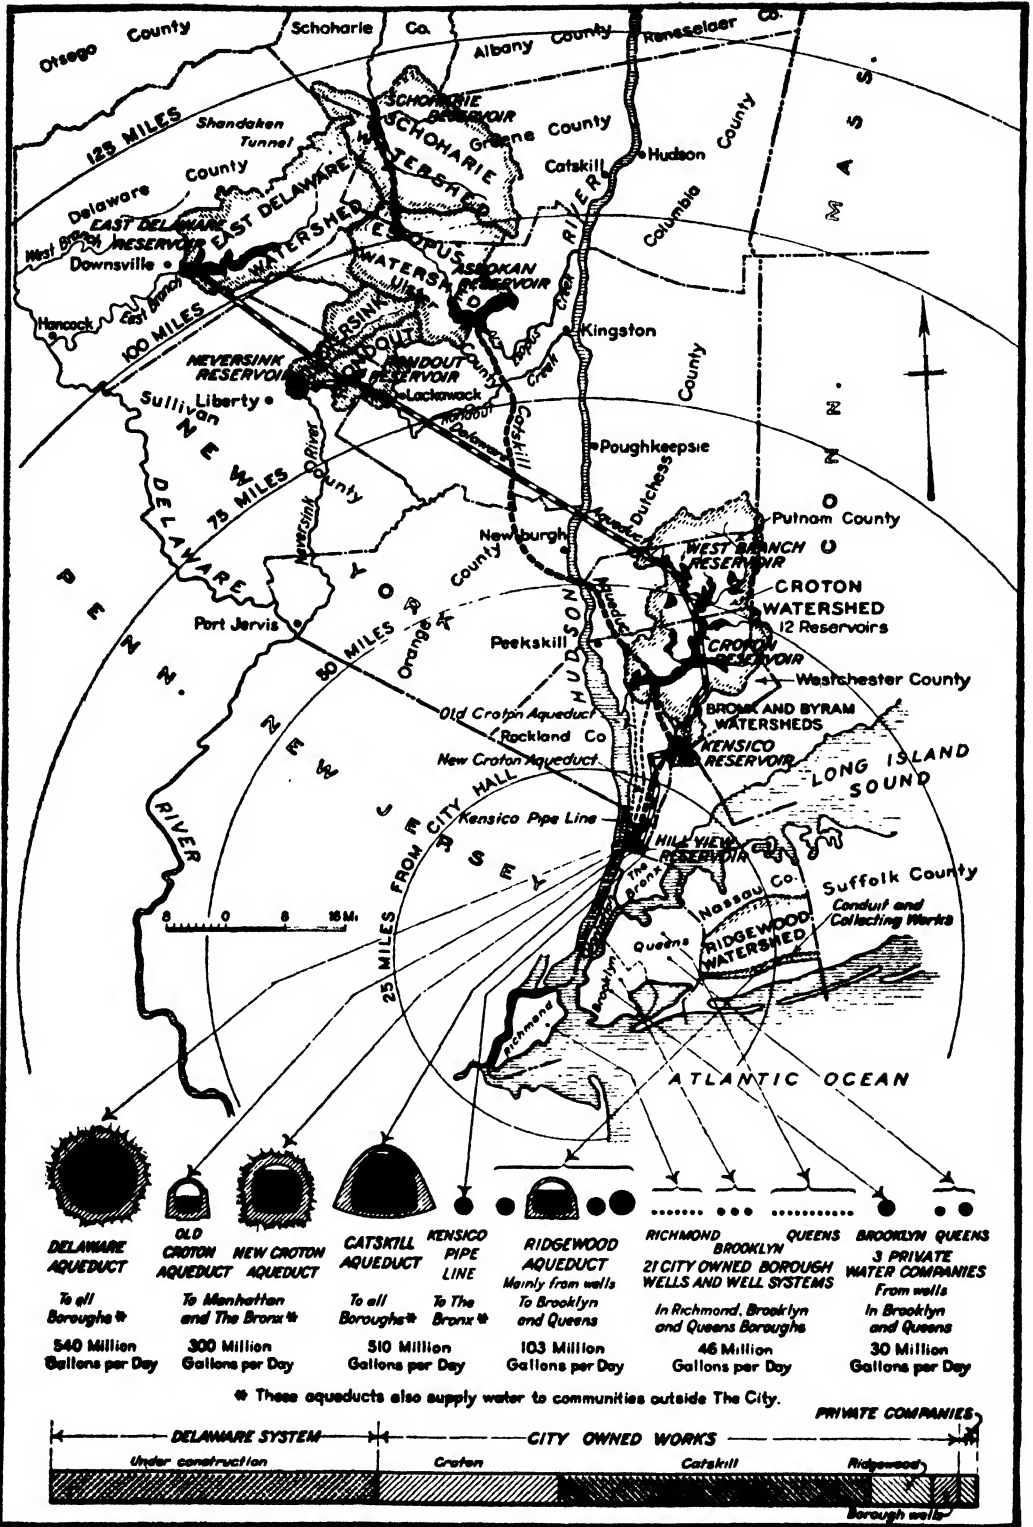

Boston. The Metropolitan District Water Supply for Boston brought forward early in the year a proposal to build a pressure aqueduct and tunnel to bring the new Ware-Swift River supply into the city, to replace the present grade-line aqueduct east of the old Wachusett Reservoir, and to abandon several older, intermediate reservoirs. This proposal has certain features similar to the deep-pressure tunnel-main distributing system of New York. In September a PWA grant was made to provide for the completion of the new Quabbin Reservoir (clearing some 20,000 acres, regulating dams, etc.) and also for work on the proposed aqueduct.

Miscellaneous. Beside these giant projects several other water supply constructions should be noted. Progress on the 6.6-mile Gunpowder Falls-Montebello aqueduct tunnel for the water supply of Baltimore, Md., was interrupted by a premature explosion on July 20 in which 10 men lost their lives. This project, involving a 12-ft. diam. tunnel, is being carried out from six headings run from three shafts and a portal.

Another work of particular interest is the new supply for Salt Lake City which originates in the Wasatch Mountains southwest of the city. From Deer Creek Reservoir on the Provo River, a 40-mile aqueduct is to skirt the mountains and bring in additional water for domestic use. The project, however, furnishes both an irrigation and a domestic water supply. It is being built under the U.S. Bureau of Reclamation and the city is to carry 46 per cent of the cost of the development plus the entire cost of the aqueduct. See WATERWORKS AND WATER PURIFICATION.

ARABIA. A large peninsula in southwestern Asia. Area, 1,000,000 square miles; population, assumed to be 10,000,000. The divisions of Arabia are given below. For the Arab countries outside of the Arabian peninsula, see separate articles on EGYPT, IRAQ, PALESTINE, SYRIA AND LEBANON, and TRANS-JORDAN.

Aden, a'den. A British colony and protectorate occupying the southern coastal region of the Arabian peninsula from the Strait of Bab el Mandeb to Oman. The colony consists of the important naval base and fortified seaport guarding

Courtesy, Board of Water Supply, City of New York.

THE WATER SUPPLY OF THE CITY OF NEW YORK

Total dependable present supply from all sources, 989 million gallons a day. Total dependable supply upon completion of the Delaware System, 1529 million gallons a day.

the entrance to the Red Sea, 75 square miles of adjacent territory on the mainland, and Perim Island (area, 5 sq. mi.). Population in 1931, 48,338 (54,923 in 1921). Aden Protectorate, comprising the hinterland of the colony, was greatly enlarged in March, 1937, by the Order in Council incorporating therein the entire stretch of coastal territory from the colony northeastward to the Sultanate of Oman. This region, known as the Hadhramaut (Hadhramaut), was previously under loose British control. The area of the colony and protectorate combined is officially estimated at 42,000 square miles, but Aden's frontiers with Yemen and Saudi Arabia on the north are vaguely defined and some authorities place the area at over twice the official estimate.

Aden is a free port and a commercial and transshipment center for the Arabian peninsula. The colony produces little apart from the manufacture of salt and cigarettes. Dates, indigo, tobacco, and gums are the chief products of the protectorate. Numerous cattle, sheep, and goats are raised and some butter is exported. The colony's imports by land and sea in 1936-37 were valued at Rs70,886,985; exports, with 4500 metric tons of coffee from the protectorate and Yemen, Rs43,070,424 (rupee averaged \$0.3733 for 1937). In the same year 1911 merchant ships of 7,598,074 tons entered the port of Aden.

Revenues of the colony in 1936-37 totaled Rs1,410,048 and expenditures Rs1,137,432. Aden was separated from the government of India on Apr. 1, 1937, and made a British crown colony. Governor and Commander-in-Chief, Lt.-Col. Sir Bernard R. Reilly (assumed office Apr. 1, 1937). The protectorate is indirectly controlled by the governor of Aden through local rulers.

Bahrein (ba-rān') **Islands.** An archipelago in the Persian Gulf, 20 miles from the Arabian coast. The important islands are Bahrein, Muharrak, Sitra, Nebi Saleh. Area, 213 square miles; population, 120,000. Chief towns: Manama (capital), 25,000 inhabitants; Muharrak, 25,000. The main industries are pearl fishing, date cultivation, boat building, and the breeding of fine white donkeys. Oil was discovered during 1932. In 1937 there was an estimated production of 7,848,180 bbls. of oil. In 1935-36 total imports were valued at Rs13,302,010; exports, Rs9,395,690 (rupee averaged \$0.3696 paper in 1935; \$0.3752 paper in 1936). A political agent represents the government of India, which has been in treaty relations with Bahrein since 1820. Ruling Sheik, Sir Hamad bin Isa al Khalifa (succeeded, Dec. 9, 1932).

Kuwait. A semi-independent state along the northwest coast of the Persian Gulf, under British protection. Area, 1930 square miles; population, 50,000 exclusive of an indeterminate number of Bedouins. In 1933-34 imports were valued at £258,857; exports, £94,516—pearls, horses, and wool were the chief items. Ruling Sheik, Sir Ahmed Ibn Jabir al Subah (succeeded, Feb. 23, 1921).

Oman. An independent state in southeast Arabia. Gwadar, a port on the Persian side of the Gulf of Oman, belongs to Oman. Total area, 82,000 square miles; population, 500,000 (estimated), mainly Arabs but there is an infusion of Negro blood along the coast. Chief towns: Muscat (capital), 4500 inhabitants; Matrah, 8500. Dates, limes, pomegranates, and dried fish are the principal products. In 1936-37 imports were valued at Rs4,465,861; exports, Rs3,241,641. Rice, coffee, and sugar are the chief imports. In 1936-37, 135 steamships (484,911 tons) entered and cleared the port of Mus-

cat. The revenue of the Sultan is between Rs600,000 and Rs700,000 a year (rupee averaged \$0.3752 paper for 1936; \$0.3733 paper for 1937). Sultan, Sayid Said bin Taimur (succeeded, 1932).

Oman, TRUCIAL. The six Arab states north of Oman, under treaty relations with Great Britain. Area, 6000 square miles; population (1916 estimate), 80,000 including 8000 nomads. Chief capital, Abu Dhabi (6000 inhabitants). The export of pearls to India is the main trade of the coast ports. The British Political Resident at Bushire in the Persian Gulf is the recognized adviser and arbiter for Trucial Oman. The six states and their ruling sheiks are: Shargah, Muhammad Sultan bin Saqar (succeeded, 1924); Ras al Khaimah, Sultan bin Salim (succeeded, 1919); Umm ul Qawain, Ahmad bin Rashid (succeeded, 1929); Ajman, Rashid bin Humaid (succeeded, 1928); Debai, Said bin Maktum (succeeded, 1912); Abu Dhabi, Shakput bin Sultan (succeeded, 1928).

Qatar. The peninsula to the west of Trucial Oman. Area, about 8000 square miles; population (1916 estimate), 25,000. Capital, El Bida (Doha). Qatar's relations with Great Britain are regulated by the treaty of Nov. 3, 1916. Sheik, Abdullah Ibn Jasim eth Thani (succeeded, 1913).

Saudi (sa-ōō'dē) **Arabia, KINGDOM OF.** The country formerly known as the Kingdom of Hejaz and Nejd and its Dependencies. Ruler, Abdul Aziz ibn Abdur Rahman al Faisal al Saud.

Nejd extends over some 800,000 square miles of central Arabia and includes the Nafud and Dahna deserts. Population (estimated), 3,000,000. Chief towns: Riyadh (capital), 30,000 inhabitants; Hufuf, 30,000; Mubarraz; Shaqra; Anaiza; Buraida; Hail; Jauf; Sakaka; Hauta. The raising of camels and sheep is an important industry. Dates, wheat, fruits, wool, barley, hides, clarified butter, and woven cloaks are the main products. Nejd is governed in patriarchal manner by the King. His first son, Emir Saud, acts as Viceroy in Nejd where he normally resides.

Hejaz extends along the west coast from Trans-Jordan to Asir. Area, 150,000 square miles; population (estimated), 1,500,000. Chief towns: Mecca, the capital and holy city of Islam, 80,000; Jidda, the seaport for Mecca, 30,000; Medina, the site of Mohammed's tomb, 20,000; and Yenbo (Yanbu), the seaport for Medina. Honey, dates, butter, fruit, hides, and wool are the principal products. The main income of the country is derived from the annual pilgrimage of Moslems from abroad to Mecca and Medina. The Hejaz is governed by a council of ministers under the presidency of the King's second son, Emir Faisal, who acts as Viceroy during the King's absence.

Asir, a province between Hejaz and Yemen, was ruled as an independent state by the Idrisi dynasty until 1926, when it accepted the suzerainty of Ibn Saud. In 1933, because of the Idrisi uprising, it was incorporated in Ibn Saud's dominions. Area, 14,000 square miles; population, 1,000,000. Sabiya, the capital, has 20,000 inhabitants.

Yemen. An independent state between Saudi Arabia and the Aden Protectorate. Area, 75,000 square miles; population, 3,500,000. Chief towns: Sana (capital), 25,000 inhabitants; Hodeida (chief port), 40,000; Taizz; Ibb; Yerim; Dhamar. The chief agricultural products are barley, wheat, millet, and coffee. A large number of hides are exported. Ruler, Imam Yahya ben Muhammed ben Hamid el Din.

HISTORY

Events during 1938 demonstrated the rapidly increasing importance of the Arabian peninsula in the calculations of the great European powers. Its strategic importance dominating the main shipping route to India and the Far East had been enhanced by the development along the western coast of the Persian Gulf of the trunk airlines from Europe to eastern Asia. The economic interest of the powers in this region was greatly increased by the discovery of rich oil deposits in the Bahrein Islands and on the adjacent Arabian coast beginning in 1935. By 1938 the Bahrein Islands had been transformed from a quiet and remote little Arab state dependent upon the pearling industry to the headquarters of an extensive petroleum industry employing hundreds of British and American citizens. Oil concessions were yielding substantial incomes to native rulers and arousing dreams of greater riches in the future. The establishment of air services and improvement of steamer services from Bahrein to Iraq and India, together with their new-found oil wealth, was rapidly transforming the outlook of the Arabs of Bahrein and Trucial Oman. The development of Saudi Arabia and Iraq as relatively strong and independent Arab states and Italy's rivalry with Great Britain in the Red Sea region following her conquest of Ethiopia in 1936 all served to stimulate the pace of the peninsula's political and economic development.

British Activities. To offset Italian propaganda designed to undermine British prestige throughout the Arab world, the British Broadcasting Corporation on Jan. 3, 1938, began daily broadcasts in Arabic to the Near East. Guest speakers at the opening ceremony in London were Emir Seif al Islam Ahmad, son of the Imam Yahya of Yemen, the Ministers of Saudi Arabia and Iraq to London, and the Egyptian Ambassador. At the same time the British undertook to strengthen their relations with the Arab rulers of the peninsula.

Late in February the Earl of Athlone, younger brother of Queen Mary, accompanied by his wife, the Princess Alice of Albany, and his nephew, Lord Frederick Cambridge, arrived at Jidda on an official visit to Saudi Arabia. They were met at Jidda by King Ibn Saud, his sons and officials, and were lavishly entertained there and during their subsequent journey across Arabia to the Persian Gulf by automobile. From Jidda they traveled to Taif, Riyadh, Hasa, Rumaihiya, Hofuf, Alhasa and by launch to the Bahrein Islands. Honored by this first visit of a member of the British royal family, Ibn Saud responded by inviting Princess Alice along with his male visitors to a banquet. It was the first time he had dined with a woman. In August the Crown Prince of Saudi Arabia, the Emir Saud, made a private visit to London.

While the Earl of Athlone was in Saudi Arabia, the Sultan of Oman paid a state visit to Great Britain, where he received flattering attentions. The fact that Oman's deep-water port of Muscat controlled the entrance to the Persian Gulf and that the Sultan's overseas possession of Gwadar on the Mekran coast of Baluchistan was an important station on the British air route to India was stressed by the London press in connection with his visit.

Kuwait's Difficulties. The British were also concerned lest the controversies of the Sheik of Kuwait with both Iraq and Saudi Arabia lead to the absorption of the principality by one of its neighbors. In November, 1914, the British agreed to recognize Kuwait as an independent principality

under their protection and to guarantee the Sheik's control of his date groves in Iraq in perpetuity in return for his aid in capturing Basra from the Turks. The pledge regarding the date groves was not included in the Anglo-Iraqi treaty of 1932 establishing Iraq's independence. Consequently the Iraq Government imposed heavy taxes upon the groves. The Iraqis declared that the Sheik took advantage of the British promise to increase his property holdings in Iraq and to claim tax exemption for the new acquisitions. With influential Iraqi circles represented as eager to acquire the good harbor at Kuwait as their only alternative outlet to Basra on the Gulf, the British feared that a bargain might be made between the Sheik of Kuwait and the Iraq Government that would lessen British control over the strategically important principality.

Kuwait's difficulties with Saudi Arabia were due to the action of King Ibn Saud in closing the Kuwait-Saudi Arabian border to trade, ostensibly to lessen smuggling through Kuwait but apparently to encourage commerce through the Saudi Arabian port of Uquair. A closer association between the two states appeared to be the only course that would revive Kuwait's former trade with Saudi Arabia, but this would involve an increase in Ibn Saud's influence in Kuwait at British expense.

Anglo-Italian Pact on Arabia. The British took steps to check Italian political and commercial penetration on the eastern shore of the Red Sea by the Anglo-Italian treaty signed at Rome on Apr. 16, 1938. The two powers agreed to respect the independence and integrity of Saudi Arabia and Yemen, to seek no privileged position of a political character in these territories, to jointly oppose the acquisition of territory or of privileged positions in this region by any other power, and not to claim sovereignty over or fortify certain islands in the Red Sea to which Turkey renounced her rights in the Treaty of Lausanne. They also agreed not to intervene in any conflict that might break out between or within Saudi Arabia and Yemen and to oppose such intervention by any other power. The Italian Government recognized for the first time the addition of the Hadhramaut to the British Aden Protectorate and agreed not to attempt to acquire political influence in this zone or in the other Arab territories of the peninsula under British protection. The British in return agreed to respect the autonomy of the Arab rulers under their protection and to permit Italians to trade, travel, and reside in such territories. See GREAT BRITAIN and ITALY under *History*.

Although sympathetic to the Arab cause in Palestine (q.v.), the Governments of Saudi Arabia and Yemen did not intervene in the Palestine conflict in 1938 except to support a proposal for an Arab-Jewish settlement submitted to the British by the Iraqi Government in July (see IRAQ under *History*). Traffic between Yemen and Aden was resumed in the latter part of 1938 after the settlement of their dispute.

ARBITRATION, INTERNATIONAL. An arbitration Convention between the United States and the Netherlands relating to the sufficiency of the payment made by the United States for military supplies was signed Mar. 18, 1938. Michael Francis Doyle, a Philadelphia attorney, was named to the Permanent Court of Arbitration on February 16 by President Roosevelt, to succeed the late Newton D. Baker. With Mr. Doyle was named Henry L. Stimson, former Secretary of State, who will take the place of John Bassett Moore, whose term

expired. Other American members of the court were Judge Manley O. Hudson and Green H. Hackworth, State Department legal advisor.

The determination of the Republics of the American Continent to settle their international differences by pacific means was demonstrated in the solution of the question that developed between the Dominican Republic and Haiti. In 1935 the two countries had settled their old and vexatious boundary problem, but in October, 1937, a new issue arose out of certain events which occurred on the border of the two countries. After a series of conversations and negotiations, the Permanent Commission of Washington was requested to exercise the functions of conciliation granted to it by Article 3 of the Conciliation Convention of 1929. Under the auspices of the Commission an agreement was signed at the Pan American Union on Jan. 31, 1938, settling the dispute.

Further confirmation of the principle of pacific settlement of international controversies was given in the steps taken during the past year in the dispute between Honduras and Nicaragua over their common boundary. When the question began to assume serious proportions in the fall of 1937, the Governments of Costa Rica, United States, and Venezuela tendered their good offices, which were immediately accepted by the two Governments. On December 10th, the two countries signed a protocol in San José to avoid misunderstanding with respect to the boundary dispute, and since then negotiations have been in progress looking toward a solution of the basic question.

Representatives of Ecuador and Peru have continued in Washington during the past year under the terms of the agreement signed at Lima on July 6, 1936, looking toward the settlement of their boundary dispute. Since the inception of the meetings in Washington on Sept. 30, 1936, various proposals have been advanced, and it is hoped that eventually a solution will be found to this long-standing controversy.

Trail Smelter Case. As far back as 1924, residents of Stevens County, Washington, complained about damage to their crops, etc., from the fumes emanating from the stacks of the Consolidated Mining and Smelting Co. at Trail, British Columbia. Because of the insistent demands for redress, Canada and the United States referred the matter to the International Joint Commission for investigation and report. That report was rendered in 1931. By a convention signed Apr. 15, 1935, the two Governments resolved to constitute a tribunal to pass upon the questions arising out of the controversy. The chairman of the tribunal was Jan Frans Hostie, a jurist from Belgium. The other members were the Hon. Charles Warren, of Massachusetts, and Judge R. A. E. Greenshields, of the Province of Quebec.

The tribunal convened at Washington on June 21, 1937, for organization, adoption of rules of procedure, and hearing of preliminary statements. In the early part of July it traveled over and inspected the area involved in the controversy in the northern part of Stevens County in the State of Washington and also inspected the smelter plant at the Consolidated Mining and Smelting Co. at Trail, British Columbia. It held sessions for the reception and consideration of evidence, oral and documentary, at Spokane, Washington, Washington, D. C., and Ottawa, Ontario, Canada, extending from July 7 to Oct. 19, 1937.

An ad interim decision has now been rendered in which a previous monetary sum which the De-

partment of State received from Canada brings the total sum for damages to Oct. 1, 1937, \$428,000. The tribunal found that the controversy was one between the United States of America and the Dominion of Canada, involving damage occurring in the territory of one of them by an agency situated in the territory of the other, for which damage the latter has assumed by the convention and international responsibility.

In the course of its deliberations the tribunal found that approximately 300 to 350 tons of sulphur were being emitted daily in 1930. There were three questions presented to the tribunal for determination. The first question was: "Whether damage caused by the Trail Smelter in the State of Washington has occurred since the first day of January, 1932, and if so, what indemnity should be paid therefor?"

The tribunal found that damage had so occurred and made an award of \$78,000 for such damage from Jan. 1, 1932, to Oct. 1, 1937, with respect to damage to cleared land and uncleared land, and uncleared land used for timber. The United States, in addition to the claim for damage to land and timber, asserted damage in respect of livestock, damage in respect of property in the town of Northport, and damages in respect of business enterprises. But the tribunal failed to uphold the contention of the United States that damage had occurred to these properties.

The second question which the tribunal was asked to rule upon was: "In the event of the answer to the first part of the preceding question being in the affirmative, whether the Trail Smelter should be required to refrain from causing damage in the State of Washington in the future, and if so, to what extent?" The tribunal decided that until the date of its final decision the smelter should refrain from causing damage in the State of Washington in the future to the extent set forth in a temporary regime provided for in the decision until Oct. 1, 1940, and thereafter to such an extent as the tribunal should determine.

The third question was: "In the light of the answer to the preceding question, what measures or regime, if any, should be adopted or maintained by the Trail Smelter?" The tribunal was of the opinion that with the information at hand it was not able to determine upon a permanent regime for the operation of the smelter. However, it did set forth in detail a temporary regime which was to be put into operation by May 1, 1938, to cover the remainder of the crop-growing season of 1938, the crop-growing seasons of 1939 and 1940, and three months beyond Oct. 1, 1940. This temporary regime is to be under the technical supervision of two experts who will act as consultants to the tribunal and be under its authority. As a part of the regime it is provided that for the entire period until Oct. 1, 1938, the sulphur dioxide recorder which measures the sulphur content of the air shall be continuously operated. When, between the hours of sunrise and sunset, the sulphur dioxide concentration exceeds one part per million for three consecutive 20-minute periods, and the relative humidity is 60 per cent or higher, the smelter shall be immediately notified and the sulphur emission from the stacks of the plant maintained at five tons of sulphur per hour or less until the sulphur dioxide concentration at the recorder falls to 0.5 parts per million. The regime, however, is intended to be elastic and under the complete control of the tribunal. The expenses for this temporary regime will be undertaken by the Dominion of Canada.

ARCHAEOLOGICAL INSTITUTE OF AMERICA.

A society for the promotion of archaeological investigation and research, founded in Boston in 1879 and incorporated by Act of Congress in 1906. It has accomplished its purpose in part through the American School of Classical Studies at Athens, the School of Classical Studies of the American Academy in Rome, the American Schools of Oriental Research in Jerusalem and Baghdad, the School of American Research in Santa Fe, N. M., The American School of Prehistoric Research at Peabody Museum, Yale University, and the Committee on Medieval and Renaissance Studies. Further work of the Institute is the support of lecture programs before its local chapters and aid given to excavations. In 1938 it had 36 societies or chapters with a total membership of about 1633. The official organ is the *American Journal of Archaeology*, a quarterly. The officers for 1938 are: President, William B. Dinsmoor, Columbia University; general secretary, H. T. Westbrook, Columbia University; treasurer, Seth T. Gano, Boston, Mass.; and recorder, Stephen B. Luce, Boston, Mass.

ARCHAEOLOGY. One of the most interesting finds made this year in Egypt was that of the diorite quarries worked by King Chephren (c. 2750 B.C.) at a place in the desert about 50 miles northwest of Abou Symbel. Here were found two new diorite quarries. The first revealed a great series of diggings about a half kilometer in length. The site was marked by a platform constructed of large blocks of diorite on the top of which was placed a black granite stele bearing the cartouche of the king, Cheops. According to this the name of the place was "The Hunting Grounds of Khufu." On each side of the stele were two blocks of diorite, triangular in shape and weighing about a half ton each. At another quarry was found a fine bronze chisel belonging to the old kingdom. It weighed about a kilogram.

At the other end of the Nile, at Hermopolis, has been found a third underground gallery dedicated to the worship of the Ibis and Cynocephalus, the baboon-headed deity symbolic of the god Thoth. This gallery is connected with two other galleries which had been previously found. The find of this year is supplied with a monumental staircase which leads up to the surface of the ground. At this point was found an open-air chapel on the walls of which appears the name of Alexander Aegus, the son of Alexander the Great and Roxanna, together with the name of Ptolemy Soter I. The gallery uncovered this year differs from those previously found in having a balustrade of sandstone carried around it. To the north of the gallery has been located a well-preserved embalmers' workshop. In it were materials as they had been left on the floor. The embalmer's bed with its circular drain was intact. It was in this room that the great numbers of ibises and baboon-headed gods were deposited by pilgrims from all parts of the country. Behind the balustrade was uncovered a mud building in which the priests of the place collected their fees from the visitors.

The monumental staircase already referred to led down to a labyrinth of streets lighted by shafts reaching up to the surface of the ground. Under the ground the excavators discovered a long, narrow chapel on the walls of which were painted scenes representing the worship of the Ibis. On the ceiling were signs of the Zodiac.

Although the place had been plundered at some time in the past, a mummified baboon was found

adorned with jewelry. It was walled up in a niche and dates about 2500 years ago.

About 2000 feet to the south of the gallery already described were uncovered the remains of a large temple and the residences of the priests of the place. Here was found a huge well 20 feet in diameter and 118 feet in depth. There are also traces of a garden where ibises were bred.

At Sakkara one of the most interesting finds was that of the tomb of King Aha, probably the first dynasty king, Menes. It dates around 3400 B.C. The tomb is of the Nagadeh type with a maximum height of 1.70 m. and is decorated with "palace façade" paneling. The part above ground was divided into 27 magazines. Under the center are five underground rooms. The partitions were of mud, faced with reed mats arranged in a pattern. The tomb had been already robbed. In it were found hundred of bits of pottery bearing the name of the king.

Also at Sakkara, 12 mastabas have been opened. The most remarkable proved to be that of Her-Neb-Kaw, a royal son of the vizier of the sixth dynasty. Originally the tomb belonged to a vizier by the name of Akhet-Hetep, who seems to have belonged to the time of King Unas. The mastaba contained a chamber, the roof of which was held up by pillars of white limestone, on each of which was painted a figure, name, and titles of the deceased. On one wall he is represented as seated and playing draughts while he watches a group of dancers. Servants are filing past with food. Many scenes in all are represented, forming the largest collection of paintings we have from the Old Kingdom.

One of the most important discoveries at Sakkara this year is that of the route which connects the valley temple with the funerary chapel of King Unas. The pavement and the walls on either side are made of white limestone, which material was also employed for the ceiling. The latter was painted blue and spangled with stars to imitate the sky. On the side walls were scenes and inscriptions. This unusual passageway is 765 yards long and 7 feet wide by 9 high. A central slit down the center admitted light. Not far from the chapel of Unas was found a sun-boat about 49 yards long by 7½ wide. This was built in connection with the pyramid. In the vicinity of the valley temple more than 300 stelae and false doors came to light. In the mastaba of Ra-Khuf, a provincial governor and "President of the Judgment Hall," were recovered two fine wooden statues.

Under the causeway from the valley temple to the chapel of Unas has been found an ancient cemetery which contains at least 20,000 burials. It dates late in the fifth dynasty. On the walls of the causeway itself inscriptions speak of a school for stonemasons near the quarries at Assuan.

At Tell el-Kheleif, the site of ancient Ezion-Geber, on the Gulf of Aquabah, Transjordan, the American School of Oriental Research, Jerusalem, has uncovered the remains of an ancient town which is probably Solomon's seaport and naval base, Elion-Geber. The site is now 556 meters from the gulf, but that is to be explained by the continuous drifting of sand from the north. The digging has revealed a practically complete copper-smelting plant and this as well as other evidence establishes the fact that the town manufactured copper implements, ropes, baskets, matting, made beads of crystal, agate, carnelian, and mother-of-pearl. It was also apparently a place where ships were built. So far about 45 rooms have been ex-

cavated. Of these about a quarter belong to a separate building unit devoted to the smelting and refining of copper. Nothing so complete has been found up to now. Masses of ashes and wood found in some of the rooms tell of the use to which they were put. Much handmade pottery has been found on the site, none of which antedates the 13th century B.C. At Megiddo the Oriental Institute of the University of Chicago dug down to the bed rock. The evidence accumulated points to a walled city at this place as early as 3000 B.C. The original wall of this town was 12 feet in thickness. The diggings went through 20 levels before they arrived at a cave which contained neolithic pottery and flints. These objects belong before 3500 B.C. About the time the walls of the city were erected an ornamental, flagged pavement was laid for a structure of sun-dried brick which was probably a shrine since it contained an altar. Horned animals with long tails were cut in the stones. Excavations along the walls of the city showed that in places these walls had later been increased to a thickness of 24 feet. The city was found at the eighteenth level of the mound.

At Atchana in North Syria, near Antioch, the British Museum Expedition has found a palace dating about 1600 B.C. The building had been burned in the first half of the 15th century. The palace was not of one period. Originally it was a great complex, uniform in plan with separate units grouped around different courtyards. Later on this structure was pulled down and a new one was erected on the site but set at a different angle. Later still against two sides of this building an official annex was added.

From the ruins nearly 300 written documents were recovered. From these were learned the names of two kings, Nigmepa and his son Iluna-ili, rulers of the city of Ala-lakh—the Atchana mound.

The front of the palace presented an imposing appearance. Here was a splendid façade with basalt stairs which led up to a colonnaded doorway. The walls were of polished basalt below and mud brick and timber above. In all there were two stories. From the entrance hall a door led to the residential part of the building; another on the right led to the state offices. The private quarters of the royal family were upstairs whither one went by means of a wide flight of wood stairs which were built into a brick stairwell. On the ground floor were the quarters of the personal servants of the family, with the men on one side and the women on the other. Each set of apartments was independent with its own bedrooms, bath, and lavatory.

The annex was built around three sides of a court with the greater portion given over to two long rooms of large size, divided in two by a central column which was flanked by piers which projected from the walls. Against the outer wall was built a staircase around a brick column which served as a newel. Under this staircase was a cupboard and next to it a suite of rooms consisting of a workroom, a bedroom, and a lavatory. This apartment seems to have belonged to the archivist since at the end of the building is a regular archive room with a cemented floor, and all around the walls a low bench on which the tablets could be piled in baskets properly labeled. On the floor of this room were scattered tablets which the tenants were unable to remove.

At Chagar Bazar in Syria, the British Museum and the British School of Archaeology in Iraq

have found an ancient record office containing some 70 tablets dating about 1900 B.C.

Also at Tall Brak the same scholars have excavated the mound which marks the site. In the upper part, which dates about 1500 B.C., they found late examples of Habur ware. Between 2000 and 3000 B.C. the occupants of the place were Sumerians. In the southern part of the mound was found a large Sumerian palace whose walls of mud brick were well preserved. The palace, which has been burned, dates about 2300-2500 B.C. In a house near the palace was found a private chapel. In the latter was a semicircular clay altar connected by a hole with a secret chamber in which the priest might conceal himself and whisper through the hole to give the effect of an oracle.

At Mari in Mesopotamia the French have worked on the palace discovered in 1935. It has proved to be the most complete example of architecture of about 2000 B.C. found in Mesopotamia. From the great court of the palace a succession of stairs and landings formed a kind of processional way that led to a sanctuary. Near the palace was discovered a Ziggurat still rising to the height of 50 feet above the plain. An excellently preserved temple had been cut in the side. This opened on a large terrace with sacrificial altars on either side of the entrance. The sanctuary was entered by a long passage which led to a large room against the walls of which were placed beds which were probably related to the marriage rites. Facing the door inside the sanctuary were two bronze lions—that is to say, wooden forms covered with bronze leaf.

The excavations of the American School in the Agora at Athens have produced important results this year. Just east of the Tholos has been found the 6th century B.C. boundary stone of the market place. It consists of a marble post 3 feet 10 inches in height by 1 foot in width. Across the top and down the right side is an inscription which reads "I am the boundary stone of the agora." The stone was fixed in a hole hewn in the bed rock. By finds of typical vases and reliefs the site of the Eleusinion has been fixed. One dedicatory relief shows Trip- toleμος in a chariot with serpent wheels.

Some very fine pieces of sculpture have been uncovered. Among them is a perfectly preserved head of Hermes which had been broken from a post. It wears a mustache and is a copy of the work by Alcámenes. Besides this was recovered a well-preserved small standing Hermes. The figure is posed with the weight on one leg and the other slightly bent. The head was made separately. This figure, like the last, is of Roman workmanship.

Many early vases have been found, one being a proto-Attic oinochoe of the 7th century B.C. Another object was a large stand handsomely decorated in the orientaling style of the first quarter of the 6th century B.C. The list of ostraca has been increased by the finding of one bearing the name of Hyperbolos who was the last Athenian to be ostracized. This happened in the year 417-16 B.C.

ARCHERY. See SPORTS.

ARCHITECTS. THE AMERICAN INSTITUTE OF. A society founded in 1857 to organize and unite in fellowship the architects of the United States, to combine their efforts so as to promote the aesthetic, scientific, and practical efficiency of the profession; to advance education in architecture and in the arts and sciences allied therewith, and to make the profession of ever-increasing service to society. The corporate membership of its 70 local chapters in 1938 numbered more than 3000 of the practicing

architects in the United States. The official organ of the society is *The Octagon, a Journal of The American Institute of Architects*.

The officers elected at the convention held at New Orleans, La., on Apr. 19-22, 1938, were: President, Charles D. Maginnis, Boston; Vice-President, Frederick H. Meyer, San Francisco; secretary, Charles T. Ingham, Pittsburgh, Pa.; and treasurer, Edwin Bergstrom, Los Angeles, Calif. The executive secretary is Edward C. Kemper. Headquarters are in The Octagon, 1741 New York Ave., Washington, D. C.

ARCHITECTURE. The year 1938 brought forth no buildings that promised to serve a grateful future as landmarks of design. It was a year heavily shadowed by politics and war. English architects were suddenly made aware that a new architectural problem had been seriously and systematically posed in Germany since 1933, had been taken up by France since 1935, and had now come to England: the problem of air-raid protection. "For the first time in England since, I suppose, the end of the 15th century," lamented Sir Samuel Hoare to the Royal Institute of British Architects, "we are beginning to think once again about the fortification of private houses."

In Germany the new art was well advanced, especially among new armament factories. A prominent part of the German architectural output consisted of vast public buildings. In Berlin a ponderous new Chancellery was added to the heavily bomb-proofed Air Ministry of 1936. Such developments tended to obscure the steady growth, throughout the world, of work-a-day building.

Architects in the United States still found their opportunities sadly limited; competitions and other theoretical pursuits occupied a disproportionate share of their time. Residential construction rose well above the 1937 level but made only a slight impression on the calamitous shortage. The central problem, struggled with by architects, industry, and Government, was the discrepancy between finished building costs and consumer income. One good omen was seen in the entry of private enterprise into the upper part of the low-cost housing field, hitherto occupied only by public authorities, when the Metropolitan Life Insurance Co. inaugurated a \$50,000,000 project in New York City.

United States. Housing. This was the field in which American architecture made its most energetic and independent contribution. Not only was the influence of the new housing projects upon private building enormous, because of the enthusiasm it aroused in the public for basic decencies and amenities rather than gew-gaws, but a habit of skeptical analysis, instilled by such early leaders as the late Henry Wright, led to fresh innovations upon European practice. Thus German "row planning" was not accepted as the last word but subjected to modifications in a country where straight rows would often admit howling winds. Among the many deviations (see 1937 YEAR BOOK on the Williamsburg project in New York) was the bending of the continuous rows into series of *chevrons*, a device skilfully used by Russ & Harrison in the site plan of the Lockefield Garden apartments at Indianapolis so as to make an equivalent ground area yield each apartment an enlarged and enhanced view. So, too, the American climate led away from the favored European building type giving access to the individual apartments from long open balconies; the trend was toward T or X plans giving access to the largest possible number of dwellings from each stairhall. The highly original Y-shaped

buildings for the Queensbridge project in New York had not yet been built.

Among the projects, the following might be mentioned as architecturally outstanding: Westfield Acres, Camden, N. J., perhaps the finest in its architectural forms (Chief: Joseph N. Hettel, associates: MacNelly, Radley, Gill, Stonorov, Moffett, Hall, Jefferies, Neutze); the Langston project, Washington, D. C., with its pleasant contrast between horizontal and tall units, and its good use of sculpture (Chief: Hilyard R. Robinson, associates: Porter, Williams); Trumbull Park Homes, Chicago (Chief: John A. Holabird, associates: Armstrong, Jensen, Maher, Grunsfeld, Chatten, Merrill, Walcott, Huszagh, Hodgdon; mech. eng.: Neiler); Meeting Street Manor & Cooper River Court, Charleston, S. C., with its pleasant gabled two-story house rows (Chief: Samuel Lapham, Jr.; associates: Hyer, Burden, Thomas).

Domestic Architecture. HOUSES. The intensive interest in house building that had outstripped the skyscraper interest in America was beginning to blossom forth into fresh and vigorous design. Architects who preferred "traditional" dress were concerned with demonstrating the functional elasticity of their planning; the progressives whose pride had been based upon getting down to essentials were becoming more inventive in caring for traditional amenities. The effect was to break down both the traditionally eclectic and the doctrinaire modern types and render design more fluid.

Perhaps the most striking innovations in domestic design are found in the fresh handling and relating of different kinds of space; particularly in the relations set up between indoors and outdoors. Some designers went so far in their effort to "open up the house to nature" as to introduce within the house-mass a gap, open or transparent, making it possible to see through the house from one side to the other. One method of doing this was illustrated by W. W. Wurster's charming small house for Louis Le Hane at Palo Alto, with its entrance hall glassed from top to bottom both front and rear, framing a delightful view of the patio. Another method was adopted by Kenneth Kassler in the design of his own house at Princeton, where the semi-isolated studio was united to the main house by the extension of the main roof across an open passage.

Many efforts were made in extending the influence of the house upon the surrounding open space by means of semi-enclosure. Thus the tall Southern portico was given new forms. In a "modern" house at Shreveport, La., the architects Jones, Roessle, Olschner, and Wiener carried not only the roof-slab but the entire attic space well out over the south wall, and dropped a two-story porch screen from one end of this slab down to the ground; but the effect was not wholly successful. At Cambridge, Mass., Edward D. Stone and Carl Koch were able on a very small plot to produce a large variety of delightful garden vistas by economizing the first-floor house space and projecting a well-planned second story far enough forward to create a covered terrace below. This modest and well-studied little house won a well-deserved prize from the Pittsburgh Glass Institute for its highly appropriate use of glass.

Natural growth was used to shade a house in hot sunlight more effectively than overhangs alone, when Lloyd Wright supplied the ranch house of Raymond Griffith at Canoga Park, Cal., with an extensive and rhythmical grape trellis; in winter the leaves drop off to let the sunlight in. This ranch house was laid out L-shape in two long wings, an

effective example of a spreading but not random plan, one room wide, organized upon well-defined house-zones. A small group of supplementary farm structures constituted a very pleasant feature with its rhythmical play of roof slopes against the delicate horizontal lines of corral fences.

Porches as a form of transition from "outside" to "inside" received considerable attention. A frontless box type, enclosed at the top and two sides, made several appearances; one good example of its use was provided by the sophisticated and formal little beach house at Hobe Sound, Fla., designed by Henry Corse. On a monumental scale the same idea of an open box or hood was used as the dominant feature of a large concrete house designed for Richard Halliburton by Alexander Levy. This hood, bracketing two stories and a roof-deck, had enough formal strength and gathered enough shadow to stand forth boldly even when isolated on a wild hilltop between the ocean and a canyon inlet.

An effective variant of the boxed porch was devised by W. W. Wurster for a smart little beach house in Aptos, Cal. Here two porch wings, surrounded not by walls but by glazed screens, created a form midway between the traditional porch and an outdoor room. The house was sheathed in a novel and distinguished manner with wide vertical redwood boards running uninterrupted from foundation to roof and contrasting with narrow, brightly painted trim.

A brilliant example of flexible planning which, in a temperate climate, permitted a calculated series of transitions from open to enclosed space was supplied by W. W. Mayhew in the Harold V. Manor house at Oakland, Cal. Placed between the sheltered patio and the glass-walled living room was a glass-walled and glass-roofed winter garden, with full-height glazed doors sliding their full length to form flexible partitions that would permit the three spaces to be opened or closed for use in any combination. The pattern of the simple door frames along with the rafters and roof glazing bars was as subtly decorative in its own way as the customary use of similar materials in Japan.

The planning of interiors was equally characterized by increasing flexibility. The planning skill of R. J. Neutra was displayed in a clover-leaf arrangement for the principal rooms of the Edward Kaufmann house in Los Angeles (Peter Pfisterer, collaborator). Boundary planes were treated with new freedom. Walls and partitions laid out in large curves were becoming increasingly common and were handled with better skill. Sloping ceiling planes were carried beyond the realm of purely utilitarian expediency and employed for psychological effect. Thus Schindler, who had previously experimented with ceilings slanted so as to open up a large living room to a beautiful view, reversed the procedure in the Walker house, Los Angeles, so as to emphasize, with equal effectiveness, the seclusion of the house. Harwell Hamilton Harris, a designer of increasing power in producing quiet and natural effects by subtle and sophisticated means, contributed two noteworthy houses to the year's record. The surprising feature in the Bauer house at Glendale, Cal., was the placing of many partitions on hexagonal lines in a manner that enhanced rather than disturbed the quiet charm of the house. The Kershner house, Los Angeles, embodied on an unusually noble and soothing navelike living space.

Other praiseworthy houses remain for brief mention. In the desert near Tucson, Grosvenor Atterbury with John Tompkins as associate gath-

ered the local boulders, with their many beautiful colors, into a masculine composition of blocky polychrome masses, extensive enough for a whole pueblo village, at "Stone Ashley." In Chicago the Herbert Bruning house, by Fred Keck, with its monumental half-cylinder glass-block stair tower carefully balanced against the cubical mass and with unusual protruding window frames, was carefully studied in every respect. The trend toward the free use of classical forms was illustrated in a Regency house for Herbert Trix at Grosse Point, Mich., by Hugh Keyes—a "large house without trickery or ostentation"—and in the spirited reworking of the Greek Revival by Evans, Moore, and Woodbridge in the alumnae house of Smith College at Northampton, Mass.

APARTMENT HOUSES. A city apartment house was still considered up-to-date if it had corner windows; a suburban apartment house was still genteel if provided with little false-work gables. Distinguished examples were few.

An apartment house at 25 East 83d Street, New York City, by Frederick Ackerman, showed a daring faith in simplification supported by good proportions. Here the corners were cut off diagonally to give the building a pleasant prismatic appearance; and the uniform horizontal "window" rectangles turned out upon closer examination to be panels of glass blocks admitting light but no view; conventional windows were inserted into these panels only in walls facing outward. This building was clean technically as well as in design, and typified the new trend in elaborate air conditioning.

In San Francisco, J. S. and J. Rolph Malloch capitalized the view from precipitous Telegraph Hill in an apartment building with extensive superposed balconies that recalled similar efforts in Paris. The fresh conception of the building was slightly marred by an immature Bohemianism in the decoration, notably in the sgraffito relief on the external wall.

INDUSTRIALIZATION. In their effort to produce wholly "prefabricated" or "packaged" houses, certain industrial interests not only roused bitter controversies but stimulated competitive efforts toward mass-production among builders already in the field; both of these moves had a similar effect upon design. Architects were increasingly called upon to act in the manner of industrial designers, establishing standards and types rather than individual expressions both in planning and equipment.

Standards were undoubtedly raised by mass production in certain low-cost fields, for example among the Missouri share-croppers whom the Farm Security Administration supplied with ready-made \$930 houses. The effect in other fields was subject to a wide variety of interpretations.

Industrial and Business Buildings. **Factories and Office Buildings.** As befits a country exercising industrial leadership, the United States continued to enjoy a high standard of factory design. The factory that was most strikingly presented to the public was the one designed by Frank D. Chase and Childs & Smith for the Campana cosmetic works at Batavia, Ill. Adding no meretricious "architectural" trappings, the architects achieved their effect by the opposite approach of dramatizing only what was utterly essential and typical. A long horizontal front of white terra cotta tile alternating with uninterrupted bands of glass blocks was bisected by an equally clear-cut projecting stair tower with the company name tastefully lettered across the top. The result came close to typifying "the factory" of 1938.

Typical factory design continued to favor the single-story, top-lighted type covering a large ground area, over the multi-story types or types isolating different processes in separate wings; the reasons were economy and, more especially, flexibility in expanding or contracting different departments. For lighting purposes, monitors (alternate longitudinal bays raised over clerestories), lighted from both east and west, were generally preferred over north-lighted sawtooth arrangements.

First-class examples of the large monitor-lighted factory were to be found, as usual, in the work of the firm of Albert Kahn, Inc. The Glenn Martin airplane assembly plant at Baltimore covered, without columns, a floor area of 300 by 450 ft., large enough to house hypothetical future transoceanic planes; the plan also involved a splendid 300-ft. sectional door. Other Kahn factories were the Chrysler half-ton truck plant at Detroit, the Ford tire plant at River Rouge, and a strip mill for Republic Steel at Cleveland.

An exceptionally clean-cut factory design was the one for the Industrial Rayon Corp., at Painesville, Ohio, by Wilbur Watson & Associates, eng. The Spreckels sugar works, at Woodland, Cal., by Harry A. Thomsen, Jr., built up into a handsome group.

In designing the Columbia Broadcasting System's Los Angeles studios, Lescage was confronted with an intricate problem involving technical, commercial, and entertainment factors. The suave handling of the concrete building envelope helped to make interesting instead of restless the high degree of articulation introduced in the masses. Novel details, capitalized by the designer, were such acoustical devices as the tilting inward of the studio walls to avoid the "flutter" caused by the usual parallel wall planes; in playful spirit the architect carried a similar vertical splaying of partitions out into such features as the information booth.

A structural novelty with many possible applications was a scientifically evolved concrete column or cylinder flaring out widely at the top and used as a kind of super-umbrella around street kiosks or filling stations. The rippled form of the overhang was derived by the architect, James M. Workman, from analysis of water ripples formed by the impact of a rain-drop; and its extraordinary structural strength promised future load-bearing use.

DISPLAY AND EXHIBITION. The two fairs that were begun in 1938 to open in 1939 had not been completed. Quite evidently the Golden Gate Exposition at San Francisco was pointed at fairyland; it was built on "Treasure Island" in a motley of exotic forms from the Orient and from Mayan temples, treated with "modernistic" fluting and carving. The effect was quite certain to be Hollywood, but on what level had not yet been ascertained. Both this fair and the World's Fair at New York were based upon academic ground plans with grand avenues laid down in geometric patterns. At New York the planners, expecting uncertainties to develop in the renting of exhibition space, had spotted the various types of exhibit, such as shelter, communication, etc., in a loose set of nuclei, each of which would be free to expand or contract as occasion required. This useful idea, however, lost any visible expression as the plan unfolded. One certainty was that the exhibit structures would bear a family resemblance to those popular essays in symbolism that had formerly received undeserved scorn from the educated: those brown derby restaurants and milk-bottle refreshment stands whose attention value had been so immediate and easy. Thus the Fair was to include as "maritime" display

a façade representing two ship-prows; the aeronautic exhibit was to resemble a huge plane; a prominent chemical manufacturer was to set up in front of his exhibit a tower shaped like a 100-ft. test tube. As compared to the Chicago fair of 1933, the New York venture showed more fluidity in the individual structures, a quality arising in part from the frequent use of curved and domed structures; it remained to be seen whether the orgy of individualism would pull itself together, and how. Certain buildings promised to be of more generalized interest and usefulness, among them the station of the Long Island Railroad, designed by the Fair Construction Department.

Architecture for display purposes, when it came to stores and store fronts, followed trends already laid down in recent years. New or remodeled department stores and other large store buildings continued to depend on electric lighting inside and to use blind outside walls with areas of glass block admitting diffused light. A good example was Coulter's in Los Angeles, with horizontal glass-block bands striping its rounded contours (S. O. Clement, Architect). Like other new western department stores, this one had a second "front" (marred by fire-escapes) opening to the important parking lot. In New York the prize of the Fifth Avenue Association went to the new building for Lilly Daché, by Shreve & Lamb, Harmon, and Letellie; this was an undistinguished "distinguished" building in limestone, stucco, and glass blocks. The remodeling for Lord & Taylor, by Raymond Loewy, designer, and C. E. Swanson Associates, store planning engineers, furnished an able exposition of the latest display principles for the more elegant store. On the upper levels the typical older form of an uninterrupted floor area studded with showcase islands was modified in favor of an arrangement that lined the periphery of the room with variously shaped alcoves, making possible more intimate and personal service. Examples of effective small store fronts and interiors were Peck & Peck, New York, by J. M. Hatton; Wilmington Blue Print Service (Del.) by V. & S. Homsey; San Diego Federal Savings & Loan Association branch bank, by F. L. Hope. Chain stores continued to "clean up" and standardize their fronts with simpler designs. In California a new type of store, the "super-market," branched out into chains with vigorous speed. These grocery department stores had left behind, for greater respectability, their former wide-open fronts, but still retained their vast interiors, bountiful with fruit and vegetables, and characteristically spanned by the criss-cross of arched "lamella" roofs.

TRAVEL AND ENTERTAINMENT. The remodeling of railroad trains reached a climax of prestige with the redesign of a whole Pennsylvania fleet by Raymond Loewy and of the 20th Century Limited by Henry Dreyfuss. Many elements in the Pennsylvania designs, overstuffing in a new equivalent for Victorian bulk, seemed to imply that the traveler was no longer interested in landscape; in the Century observation car, by contrast, a good balance was achieved between privacy and openness. The boundary between fixed and mobile architectural classifications was broken down still further in a fleet of luxurious trailer-hotels built in America from designs by Alexis de Sakhnoffsky for use in the Belgian Congo. In use these mobile suites were intended to remain stationary; "streamlining" ideals seemed to have molded every possible form into a curve. Among theaters the outstanding creation was the Esquire in Chicago, a motion-picture house

by Pereira & Pereira. As in no recent American examples, the baroque handling of "modern" forms characteristic of theaters was managed in bold asymmetric balance without loss of dignity and with a certain richness.

Institutional Buildings. SCHOOLS. Several very competent schools were produced. At Fitchburg, Mass., the firm of Coolidge, Shepley, Bulfinch & Abbott struck a nice balance, blending Greek Revival details in the belfry, roof pediments, and entrance frames with modern fenestration; especially fresh and effective were the brick end-walls, blank except for the strong and graceful vertical accent given by a narrow hall-light reaching uninterrupted from the top of the entrance pediment to the cornice. The plan, however, with its somewhat labyrinthian basement, revealed by implication why an increasing number of school designers have been deserting compact classical symmetry in favor of asymmetric, articulated plans permitting narrower wings and easier functional grouping of the disparate elements that make up a modern school. At Bloomfield Hills, Mich., Eliel Saarinen contributed a distinguished and happily craftsmanlike science building to Cranbrook Academy; it was more direct in form than this architect's more eclectic previous essays. Boulder High School, Boulder, Col., by Frewen, Morris, and Huntington, demonstrated that a straightforward high-school plan could be given an exterior of vigorous and interesting composition, and that a rich texture could be achieved with rough-hewn native sandstone played against the glass of windows well grouped in sturdy wooden frames. Two eastern institutions combined small size with an air of simple distinction. One was the community building for Jersey Homesteads, by Alfred Kastner, with an exterior severe but very carefully studied, focusing attention upon the low relief sculpture of the entrance doors in hand-hammered aluminum, by Otto Wester; the interior was carefully planned to care for community as well as school activities. The other handsome achievement on small scale was a crippled children's beach house at Lewes, Del., in which a beautifully adjusted plan and beautifully economical structural elements raised sane unostentatiousness to a high virtue.

MUSEUMS. Museum directors have always faced difficulties in presenting full-scale archaic architectural material. The Cloisters, opened in 1938 at Fort Tryon Park, New York City, as a branch of the Metropolitan Museum of Art, presented a solution both bold and logical. The new building, neither a copy nor a composite of the Romanesque and Gothic cloisters and chapter house whose fragments it incorporated, served instead as a framework expressly arranged for their display. Though coeval in style with the exhibits, all new construction was kept unobtrusive and free of "antiquing." The result was as delightful to the casual visitor as it was clear to the student. The architects were Allen, Collens & Willis; the landscape architects, Olmsted Brothers.

The Brooklyn Museum opened in its remodeled building from which the monumental approaching stairway had been removed and in which numerous large halls had been converted into display space with a more neutral background. Not the least omen for a better display architecture was found in the great improvement in the architects' own shows, especially the Architectural League show in New York and the A.I.A. show in San Francisco.

CHURCHES. Churches followed, in general, the conventional Gothic and Georgian models. A strik-

ing exception among religious buildings was furnished by the Navajo House of Religion, by Wm. P. Henderson, at Santa Fe. This was a beautifully conceived well of contemplation enclosed in a polyhedral form built of concrete in the lower part and logs above. Another church that departed from the norm with the unusual result of enhancing the sense of worship instead of distracting from it was the Third Unitarian Church at Chicago, by Paul Schweikher. This modest rectangular brick hall gained power by an architectural treatment of extreme simplicity and thoughtful reticence.

HOSPITALS. Hospitals were typically designed in long wings. The city group on Welfare Island, New York City, by Butler & Kohn and York & Sawyer, was laid out herring-bone fashion in a series of open V's strung together on a spinal unit. Turrets placed along the balconied wings added a quality of vivacity to the building mass. A cleanly handled skyscraper hospital was the Medical Center at New Orleans, marred only by indecisive carving at the crown. The architects were Weiss, Dreyfuss & Seiferth. An interesting smaller, one-story hospital was the La Vina Sanatorium in the Sierra foothills, by Myron Hunt and H. C. Chambers. A happy feature was the continuation of the quake-proof steel framing members outward to form a decorative pergola; an interesting distortion was the gentle tilting of the floor and roof to follow the slope of the ground, since true levels would have seemed to tilt the building back toward the mountain.

Public Buildings. The city of Washington was caught in a lull, though large new projects were being formulated. The only major structure to be finished in 1938 was the extension to the Library of Congress, a building chiefly remarkable for the completeness and efficiency of its mechanical installations. The behind-the-scenes appointment by a Congressional Commission of John Russell Pope, the architect of the Mellon art museum, as architect for the proposed Jefferson Memorial led to a bitter controversy. The younger architects demanded that such public monument projects be thrown open to competition in accordance with the successful methods of England and Germany, and a group of society women made a dramatic gesture to save the cherry trees on the chosen site on the Tidal Basin. Pope died before the question was settled; but in the end his office was empowered to proceed with substantially the original plan in a slightly shifted location. The shrine for the Jefferson statue was to be a circular, peristylar building capped with a saucer dome, in the genteel classic so peculiar to Washington; and future historians may well wonder why it was considered worth the fuss.

Elsewhere throughout the country the erection of public buildings was scattering. In the general gloom that could produce the routine pseudo-classic monsters used as court houses or capitols, the new architectural policy governing post offices shone like a beacon; a typical product was the restrained monumental branch office in the Bronx, New York City, by T. H. Ellett.

Great Britain. The event of the year was the Empire Exhibition at Glasgow. English commentators expected that this fair might easily do for England what Stockholm in 1930 had done for the Continent, by way of dramatizing and consolidating new trends. The site was wooded Bellahouston Park, dominated by an oval hill. Instead of using the hill for a climax of construction, the site plan very wisely left this promontory free except for a tower and some restaurants, giving the public the

height from which to enjoy the gay pageant spread in a horse-shoe curve below.

A spirited harmony was preserved, in all this "cardboard" architecture, through the single control exercised by Thomas S. Tait. Especially happy was the soothing standardization among the innumerable minutiae that bulk so large in a fair: the lighting standards, kiosks, exhibition stands, and small booths. The buildings were faced with large rectangular sheets, all alike in size and proportion whether made of glass, of "asbestos cement" (flat or corrugated), or, occasionally, of corrugated steel; the joints were left showing to establish this rectangle as a universal module. The large glass areas were used as drama, e.g., in the monumental curved bay of the Hall of Industry North, or in the transparent building volumes acrobatically balanced against opaque ones in the excellent Concert Hall Restaurant; glass exteriors permitted such structures as the Atlantic Restaurant to be built around living trees, upon the fine old Crystal Palace precedent reaffirmed in Paris in 1937; even a bank, the Union Bank of Scotland, permitted itself a glass front, abandoning the old bank idiom of the solid vault with new-found confidence in being able to achieve its miracles in plain sight.

The use of wood was made especially intriguing in the Hall of the Timber Development Association by R. Fourniaux Jordan. The remarkable distinction felt in a form that was basically just a tall porched shed arose from the subtle obliquity of its walls and the searching balance between such details as a high plaque and a low entrance porch at the corner. Inside, the new industrial resources of plywood made possible an exciting contrast between a series of oblique booth screens on one side and a continuous wavy screen on the other; again between the roof trusses and the racing shell hung from them as a superb example of modern craftsmanship in wood. In exhibition technique it was the Government itself that had made the greatest progress. For the first time among fairs its display had been freed of parasitic commercialism and was homogeneously conceived to dramatize the Empire. A high point was the plastic handling of the mechanical man in the display devoted to "Fitter Britain." Only two buildings in the fair were jarringly discordant, one the "modernistic" bulk of the General Post Office building and the other an architectural cipher erected by a dissident newspaper.

Public buildings wavered in their allegiance, from straight classic to a type that implied lively commerce between the heirs of George III and their traditional friends in Sweden. Among the larger structures, the municipal buildings at Chesterfield, by Bradford, Gass and Hope, were in fairly strict and not unpleasant classic garb. The Norwich Town Hall attempted more. On the whole it was a studied example of imposing brick architecture with delicate smallish details, in the manner of the Swedish architecture of the '20's. A portico placed symmetrically against the main wall did not quite blend with the otherwise happy composition.

A number of smaller structures maintained a good standard of simplified traditionalism in brick construction; notable were the unpretentious and often graceful anti-aircraft stations, for example the one at Albany Street, London N.W.1, by Wm. G. Newton & Partners, poised lightly over the slender posts framing its garage doors.

The largest group of office buildings, designed by Stanley Hamp for Adelphi Terrace, failed to achieve much more than size. Competent smaller groups were erected on Charing Cross Road, Lon-

don, from plans by Andrew Mather & Harry W. Weedon, and at Leicester Square, by Wimperis, Simpson & Guthrie.

Industrial building yielded some very fine examples. At Welwyn City, O. R. Salvisberg in association with G. Stanley Brown produced a remarkably fine grouping for Messrs. Roche Products; at Balchley near Manchester, Serge Chermayeff gave smart and colorful precision both inside and out to a large laboratory; H. V. Miles Emerson (Robert Lutyens, associate) designed a factory entirely in terms of welded sheet steel for Steel Ceilings, Ltd.; Stanley Peach & Partners gave distinction to a warehouse for Penguin books at Harmondsworth. Among the more interesting stores were the Co-operative Store at Huddersfield, with its fine front, by W. A. Johnson, and the large vitrolite-faced furniture store at Leicester by Raymond McGrath. Maxwell Fry arranged some especially light-hearted pyrotechnics around a spiral stairway set up for an electrical display behind a Regency front in a shop on Regent Street itself.

The year saw fewer new churches of merit than did the previous one. The Church of St. Alban at Harrow, by A. W. Kenyon, built of concrete faced with brick, gave picturesque and beautiful massing to the traditional medieval forms unchanged except for extreme simplification. A smaller brick Methodist Church at Friern Barnet, by R. C. White-Cooper & Sidney R. Turner achieved a lesser success by similar methods. The Catholic Church at Androssan, by Gillespie, Kidd & Coia, used a heavy lanceted front vaguely suggesting a medieval fortress; the reinforced concrete synagogue at Dollis Hill, by Sir Owen Williams, succeeded better in the interior than with its curious prismatic and hexagon-eyed façade; the Willesden Green Federated Synagogue, by F. J. Landauer in collaboration with Wills & Kaula, was in danger, by contrast, of a craftsmanship somewhat finicking.

Among small libraries, the one added by L. H. Keay to the housing development at Norris Green, Liverpool, was a charming and gem-like building; a library at Leicester, by Symington, Prince & Pike followed in miniature the central-tower plan of Asplund's library at Stockholm; the curved corners of its outlying building masses were a refreshing departure.

School problems brought forth solutions in wide variety. The use of spreading, articulated plans had become nearly universal. The most bothersome of school problems, the large school so often rendered in abused factory forms, found a conspicuously successful solution in the large school at Sidcup by W. H. Robinson with John W. Poltock as assistant. The general disposition of its forms had been deliberately borrowed from a school by Dudok at Hilversum, Holland, especially the stunning off-the-end curve of the monumental glass stair hall. In Dudok's scheme, however, the composition had dominated the individual parts, whereas Robertson had been able to build stock parts into a composition ultimately both richer and more clear. A masterpiece of planning and articulate form was achieved by Gropius & Fry in the splendid squared S disposition of Impington Village College. The Luton Modern School for Boys, by Marshall & Tweedy (Moore, assistant) was interesting if a little tricky. Other educational buildings were the large School of Anatomy at Cambridge, by Stanley Hall & Easton & Robertson, a contemporary design oddly at home among Gothic neighbors; the small and vivacious Marylebone Health Society building with its day nursery, by the same architects; the L.M.S.

WESTFIELD ACRES HOUSING DEVELOPMENT

A view of one of the sections of this U.S. Government Housing Project at Camden, N. J.

Robert M. Damora Photograph, Courtesy of Frederick L. Ackerman

AN APARTMENT HOUSE AT 25 EAST 83D STREET, NEW YORK CITY

Frederick L. Ackerman, Architect

School of Transport, by L. M. Hamlyn, in polished "neo-Georgian."

The most fluently planned apartment group was Highpoint No. 2, a set of *maisonnettes* by Tecton. The smooth and elegantly polished front, deliberately formalized, was set off by a piquant *porte-cochère* supported on caryatids, testifying to the rapid development within the modern idiom of rococo fancy. A group of flats on Exhibition Road, Kensington, S.W., by Adie, Button & Partners, presented a similar stripped elegance in a more conventional symmetric manner. Marine Court, St. Leonards-on-Sea, by Dalgliesh & Pullen, piled continuous ships-bridge balconies one above the other to a height of 12 stories, producing an effect not unlike two superimposed liners, but very vigorous. The less costly flats or apartments were usually found in long blocks about five stories high, the monotony of identical plans and fenestration being relieved by a play of balconies, protruding stair towers, rounded tower-like bays, and breaks in plan, upon precedents recently developed either in Holland or Germany. Such were the satisfactory block of inexpensive flats at Surbiton by Ronald Ward, the competent working-class flats at Stockwell, London S.W., by Louis de Soissons, and at Maida by Caröe & Passmore, and three large projects by Edward Armstrong: at Glebe Place for the London County Council (his best), a rehousing scheme at Southwark, and a large multi-unit scheme for 398 families done for the Guinness Trust on the Loughborough Estate, Brixton.

A whole section of Albert Park Road along St. Regent's Park had been lined within recent years with a series of blocks overlooking the park, among them Vice-Roy Court, Bentinck Close, North Gate, Oslo Court. The last-named, with its herring-bone apartment plan and its tiers of box-balconies jutting obliquely for a view of the park, illustrated the degree of bizarreness that would be tolerated by current taste so long as the appearance was logical and the pattern strictly repetitive. A high quality of creative thought went into a block of three-story flats at Ellington Court, High Street, Southgate, by Frederick Gibberd. The plan was broken down, as in current American practice, into domino plan-units composed of the paired apartments across each stair-hall; these dominoes were then variously strung together in straight lines, or staggered, or T'd, according to the exigencies of orientation and ventilation—a very flexible planning method. The same careful thought went into the adjustment of direct, economical building methods so as to produce beautifully proportioned building details, such as the full-width windows.

The house of the year was the one by Christopher Nicholson near Henley-on-Thames, a fluent plan worked into a grouping that was incisive and interesting from any approach, but especially good from the garden side, on which two blank white end-areas of wall served as a handsome foil for the play with glass through the middle. Other houses: at Angmering-on-Sea, Sussex, by Yorke & Breuer; a group on a sloping street at Hampstead, by Ernest L. Freud; two timber houses, one at Mongewell, Oxfordshire, by Smith & Booth, another at Sevenoaks, Kent, by Gropius & Fry.

Hospitals composed a sizable part of the year's architectural output. Quite unprecedented among hospitals was the health center of the very progressive Borough of Finsbury, designed by Tecton. The insouciance of glass building wings shaped like airplane wings, of halls converging toward the end,

of wedge-shaped piers supporting a curved forward-leaning parapet, and all the rest, was of a kind possible only through firm mastery of planning and finesse with technical procedures. The largest of city hospitals was the vast health center at Birmingham with its highly organized wing plan. The National Hospital, Queen Square, by Slater, Moberly & Wren, presented a handsome face to the street; the Kent and Canterbury Hospital by Cecil Burns was incisively drawn on an interesting triangular plan and made use between rooms of a prefabricated screen carrying all service elements ready for connection; the South Middlesex Fever Hospital was invitingly spread out among trees and straightforwardly executed in brick; the Convalescent Home at Rustington, Sussex, by Stanley Hall, Easton & Robertson, with a gabled roof and shutters to lend a traditional appearance, was very fine in its proportions and had an unusually pleasant continuous balcony forming a loggia below.

France. The number of brilliant examples was smaller than usual. Government buildings of the better kind continued in that simplified pseudo-modern manner that constitutes the new academism, an example being the regional post office at Lyons by Roux-Spitz. The best feature was the use of glass-prism vaulting over the central workspace. Swimming pools, such as the city pool at Pantin by Molinice, eng., & Auray, arch., were often pleasant; this one celebrated a good plan with a gay use of port-holes in its balanced façade. Among schools the most interesting was the large one at Puteaux, Seine, which combined a very intelligent grouping of plan elements—especially the imaginative play spaces—with an attractive exterior making sensible use of glass brick. The City Hospital at Lille, by Walter, Cassan & Madeline, vast beyond comprehension with its 4800 beds, had resort to every planning expedient available and thus became a new school for hospital study; it incidentally revived the useful American wheel-spoke plan for several of its units. Ginsberg & Heep's two Paris apartments combined luxurious open planning with carefully studied exteriors, in one case a little more than chic. A tour-de-force with a huge glass stair tower was achieved by Otto Bauer in the transformation of a house at Garches.

Germany. Official attention was concentrated not on the housing programs that had characterized the old Republic but on colossal public programs such as the North-South and East-West axial scheme for Berlin, a series of squares, circles, and avenues lined with public buildings by the mile, now revealed almost in its entirety through models. The new Chancellery by Albert Speer and the greatly enlarged new Tempelhof airport by Ernst Sagebiel were nearing completion. The style was Herr Speer's official classic. The agrarian program was meanwhile producing subsistence homestead types alike in their cumbersome poverty of plan and the awkwardness of such features as steep peasant-like pantile roofs; the regional differences consisted in small differences chiefly of surface. The trend toward vacation centers took form in group units, sometimes of considerable sentimental charm, e.g., the Freizeitenkirche at Eichenau near Munich by Gustav Gsaenger. Middle-class housing projects made use of more constricted plans, and exteriors of a decent middle-class inoffensiveness. Industrial plants alone continued in unhampered functionalism, the new airplane plants in particular displaying their keen efficiency, and sometimes remarkable feats were achieved with re-used materials, as in a factory at Fuerstenwalde by Karl

Schramm. But the general picture was of a skillful corps of designers hampered by an all-pervasive official bathos.

Italy. Italian architecture, under official inspiration, was succeeding incomparably in its one chosen mission: to give the contemporary movement monumental form. Future historians will be able to catalogue the elements, such as the projecting and handsomely modeled door and window surrounds, the stilted building blocks, the free spiral stairs, the impeccably executed stone or brick veneer paneling—much as one can catalogue the forms of the Renaissance. Symbolic was the physical incorporation of a Renaissance corner bay and portal, by Pietro da Cortona, within the strictly contemporary façade of a group of apartments by Vittorio Morpurgo; both elements in the combination were enhanced. The largest architectural opportunities seemed to cluster around aviation. Hence the Civil Airport at Milan, by Gianluigi Giordani, the school of aviation at Florence by Raffaello Fagnoni, and the little "city of the air" Guidonia, a self-contained village planned and built in a single operation under the direction of Alberto Calza Bini; hence too the beautiful hangar type developed by Pierluigi Nervi out of the diagonally ribbed concrete vault. Among them these projects presented a whole range of mood, a wealth of planning innovations, all serenely assured in their imposing monumentality. What they lacked, apart from the hangar, was the northern sense of humanity and athletic fitness.

A second rural town built as a unit like Guidonia, was Aprilia, deliberately held less sophisticated by its architects Petrucci & Tufaroli and engineers Paolini & Silenze. The residential product was best in the large middle-class and luxury range; outstanding as examples of planning management and plastic form were some Rome apartments by Ugo Luccichenti, a group of suburban apartments by Baniconi & Pediconi, Milan apartments by Lingeri & Terragni, a large sea-side hotel at Genoa by Luigi Carlo Daneri.

Japan. Among European models, Japan now tended to favor Italian ones; certain Japanese groups such as the Daisyo Village Office, Hyogen, by Togo Murano, could easily have fitted into above-mentioned Guidonia. Public and commercial buildings tended toward simplified, monumental, sometimes brutal forms in the most up-to-date fashions. Traditional houses, like the one by K. Osima, received little attention. They were more difficult for European taste than, say, two houses by T. Yoshida, one in brick, one wood, both with refined but more obvious relationships. Westerners were best able to appreciate the blend achieved in collaborations between Japanese and sensitive European designers, such as the Troeddsen house by A. Raymond & M. Amano.

U.S.S.R. Some of the pleasure structures, such as those in the Park of Rest & Culture at Tiflis by Khmelnitskaia & Kourdiani, recalled to Americans the early prototypes in Central or Prospect Park, while the offices for the Central Council of the Syndicates in Moscow by A. V. Vlassar could find a parallel of native exuberance only in the Saratoga of 1870. Both had more expressiveness than the neo-classic Lenin Library at Moscow by Schouko & Helfreich, whose virtue lay in the mechanism installed for the universal dissemination of knowledge. The U.S.S.R.'s best contributions were in national and town planning.

Other Countries. The generalization might be risked that whereas Italy has made contemporary

forms monumental, Scandinavia has made them humane. The northern architecture continued to be fresh, vivid, intelligently democratic in its unpretentious subordination of architectural display to human use and human scale. Sufficient evidence would be found in the endless variety of the modest vacation cabins and week-end houses, and the loving care devoted to the design of facilities for sport. Thus in **Denmark** the new National Museum, mildly rococo to conform to the old part, and well planned in long wings, presented a far less typical architectural opportunity than such modest and popular structures as the Boldklub Sports Club, which needed make no pretense of style but was devoted to the bold beauty of athletic form in its structure as well as its facilities. Other good Danish buildings were the block of two- and three-story apartments in Bellavista Park by Arne Jacobsen and the informal house that Poul Henningson sloped cleverly down the side of a hill for his own use. **Sweden** contributed, apart from her orderly planning of residential areas, such democratic innovations as Eric Friberger's inexpensive "prefabricated" houses, remarkably refined in design and in the delicate use of wood.

Finland produced an astonishing quantity of up-to-date building, and even seemed capable of securing a direct design approach from its public designing boards, as expressed in two hospitals, a maternity hospital at Viborg by the City Building Department and the General Hospital at Pori by the Medical Board. Other handsome Finnish achievements were Aalto's large pulp mill with its connected houses, the tourist hotel on the Karlberg by M. Blomstedt & M. Lampin, the church at Nakkila with its waved wooden acoustic ceiling, the somewhat heavy customs warehouse by G. Taucher, and the commercial school at Helsinki (Helsingfors) by V. Kauppaoppilaitos. This school was almost too good to be true; that is, there had been a tendency to conform the design to an artificial monumentality, a temptation inherent in Finland's classical tradition.

In **Belgium** the prize-winning villa by A. & Y. Blomme at Uccle was in the tradition of Van de Velde in the free-flowing curves of its opulent plan; the large sanatorium at Tombeek by M. Brunfaut gave handsome pictorial composition to the large hospital, although some of the details were just composition. **Holland's** architectural virility struck out in several directions. There was Dudok's bank at Schiedam with his usual sober composition; there was the large Schunk store at Heerlen, by F. P. J. Peutz, a striking cube supported in refined factory construction of mushroom columns, and sheathed entirely in glittering transparent glass cut only by the narrow framing bands; naturally many technical adaptations had to be made, as in the heating. In their Grand Hotel Gooiland at Hilversum, Duiker & Bijvoet struck out in what might at first seem like abandon, with wide sweeping curves in plan, and with a great terrace over the first-floor lobby; close attention would reveal the most careful study, and especially a brilliant solution of the special framing problem that bothers all hotels.

Czecho-Slovakia continued its new tradition of artistic cleanliness. The art museum at Prague by J. Gocar gave studied top-lighting to its painting galleries, and was properly equipped—after the experience of the Prado at Madrid—with air-raid shelters. The new French schools at Prague by J. Gillar were resolved into small units that brought the educational process down more nearly to human

scale. The **Swiss** Reformed Church at Zurich-Wollishafen by W. Henauer & E. Witschi did not quite succeed in its original interior use of wood. In the Doldertal was a phenomenon typical of the year. Here were two lovely small blocks of apartments, most carefully oriented so as not to interfere with one another, arranged so as to make the most of the beautiful landscape and proportioned so as to be worthy of it. It was Swiss and international at the same time. The architects were A. & E. Roth & M. Breuer.

ARCTIC EXPLORATION. See **POLAR RESEARCH.**

ARGENTINA. A Federal republic of South America, consisting of 14 Provinces, 10 Territories, and the Federal District including the Capital, Buenos Aires.

Area and Population. With a land area of 1,079,966 square miles, Argentina had a population estimated on Jan. 1, 1938, at 12,761,611, compared with 7,885,237 at the 1914 census. The increase during the year 1937 was 199,149, of whom 43,900 were immigrants and 155,449 represented the natural increase in the population. The estimated population of Buenos Aires on Jan. 1, 1937, was 2,290,788; Rosario, 509,604; Córdoba (1935), 302,232; Avellaneda, 233,910; La Plata, 192,225; Santa Fé, 144,871; Tucumán (1936), 136,258; Bahía Blanca, 109,660; Río Cuarto (1932), 89,600; Lomas de Zamora (1936), 84,177; Mendoza (1936), 81,106; Paraná, 72,288; Santiago del Estero, 65,718.

Education and Religion. Illiteracy among voters declined from 35 per cent in 1916 to 21.98 per cent in 1930. In 1937 there were 1,543,317 pupils enrolled in 13,036 primary schools, 25,840 students in national secondary schools, 22,538 in normal schools, 8795 in commercial schools, 8207 in industrial, technical, and vocational schools, 204 in the School of Mines and Industries, 7654 in trade schools, 5577 in various institutes, and 19,487 in 355 private schools with official standing. The national universities at Córdoba, Buenos Aires, La Plata, Tucumán, and Santa Fé, the latter with branches in Rosario and Corrientes, had a combined 1936 enrollment of 27,885. The large majority of Argentines profess the Roman Catholic religion, which is supported by the State; all other creeds enjoy freedom of conscience.

Production. Movable goods produced in Argentina in 1937 were valued at 6,450,000,000 paper pesos (2,141,000,000), or a per capita production of around 511 pesos (\$170), according to estimates by the Argentine economist, Dr. Alejandro E. Bunge. Of Argentina's movable production, 33 per cent was exported in 1936 against 6.8 per cent in the United States. The value of goods consumed in Argentina in 1936 was estimated at 4,883,000,000 paper pesos, of which 75.8 per cent was produced in Argentina and 24.2 per cent imported.

According to the agricultural census of June 30, 1937, there were 439,874 agricultural and livestock holdings (164,871 operated by owners, 197,174 by tenants, and 77,829 by others under special working arrangements). The livestock census of the same date showed 33,100,512 beef cattle, 43,790,166 sheep, 3,975,716 swine, 8,527,181 horses, 4,875,990 goats, and 905,041 mules and asses. Wool production (1937) was 187,500 metric tons. The area under grain in 1937 was 46,840,000 acres. Preliminary returns for the principal 1937-38 crops were (in metric tons): Wheat, 5,030,000; corn, 4,545,000; linseed, 1,539,400; cotton, 51,445. Oats, barley, rye, birdseed, sugarcane, grapes, maté, tobacco, rice, peanuts, sunflower seed, and various fruits are

other leading crops. The output of the chief minerals in 1937 was (in metric tons): Petroleum, 2,308,000; tungsten ore (tungsten trioxide content), 455; lead, 15,000; zinc, 3700. Some copper, gold, silver, coal, borate, salt, and limestone is mined. Fisheries production rose from 22,153 tons in 1920 to 45,378 tons in 1936.

The 1935 industrial census (final figures) showed 40,613 industrial establishments, with 526,495 employees and executives and a motive force of 2,573,411 h.p. In that year raw materials valued at 1,963,224,656 pesos were transformed into products worth 3,458,041,607 pesos. The leading industrial products are foodstuffs, textiles, machinery and vehicles, metals and their manufactures, electric power, printing products, chemical and pharmaceutical preparations, petroleum products, forestry products and manufactures.

Foreign Trade. Excluding precious metals, Argentine imports in 1938 were valued at 1,419,438,000 paper pesos (tariff values), as against 1,515,121,000 pesos in 1937, and exports were valued at 1,400,294,000 pesos compared with 2,310,998,000 pesos in 1937. In 1938 the United Kingdom supplied 18.3 per cent of the total imports (18.9 in 1937); United States, 17.6 (16.4); Germany, 10.1 (10.4); Italy, 5.5 (5.5). Of the 1938 exports, the United Kingdom took 31.8 per cent (29.1 per cent in 1937); Germany, 11.5 (6.8); United States, 8.1 (12.8); Belgium, 6.8 (9.4); the Netherlands, 6.4 (9.4); and Italy, 2.5 (6.2). Agricultural and livestock products normally account for 95 per cent of the value of all exports. The value of the chief export items in 1937 was (in paper pesos): Cattle products, 725,681,761; corn, 598,274,336; wheat, 475,533,763; linseed, 275,165,834.

Finance. The 1939 budget estimated expenditures at 1,048,000,000 pesos and revenues at 850,320,000 pesos. The revised 1938 estimates placed expenditures at a grand total of 996,400,000 pesos, of which 977,900,000 pesos were payable from ordinary general revenues. General revenues for 1937 actually amounted to 946,400,000 pesos and the surplus was 11,600,000 pesos. On Dec. 31, 1937, the foreign public debt amounted to 932,500,000 pesos and the internal debt to 2,816,600,000 pesos, making a total of 3,749,100,000 pesos as against 3,880,200,000 pesos on Dec. 31, 1936. After deducting bonds held by the Treasury, the net debt was 3,742,900,000 pesos on Dec. 31, 1937, and 3,607,500,000 pesos on Dec. 31, 1936. The paper peso in 1937 was equivalent to \$0.3096 in official exchange market and to \$0.3003 in the free market (\$0.2932 and \$0.2784, respectively, in 1936).

Transportation, etc. On Dec. 31, 1937, Argentina had 25,331 miles of railway lines open, of which 19,588 miles were privately owned and 5743 miles state owned. The leasing of the Central Córdoba Railway by the government in 1937 gave the state railways an entrance into Buenos Aires and the opening of the Buena Nueva-Pie de Palo branch line in 1938 gave the state network connections with the city of Mendoza. Another branch line between General Pinedo (Chaco Territory) and Tostado (Santa Fé Province) was formally opened Apr. 14, 1938. All railways in 1937 carried 153,159,653 passengers and 48,781,765 tons of freight.

The highway mileage in 1937 extended 214,628 miles; the number of automobiles was 247,970. In 1933 a 10-year highway construction program costing 315,000,000 pesos was inaugurated. During 1937 and 1938 a number of important sections of the projected national highway network were com-

pleted, including the Buenos Aires-Ushuaia and Buenos Aires-Mar del Plata routes. In addition, 4814 miles of provincial highways and some 700 miles of railway feeder roads were completed during 1937. Statistics of civil air lines operating in Argentina in 1937 were: Miles flown, 886,019 (659,815 in 1936); hours flown, 6043 (5003); passengers, 10,460 (8678); mail, 150,188 lb. (117,892 lb.); express, 77,521 lb. (71,948 lb.). A passenger air service between Buenos Aires and Rio de Janeiro via Asunción, Paraguay, was opened by Pan American Airways Feb. 21, 1938. During 1937 a total of 3245 ships of 11,408,981 net registered tons entered Argentine ports in the overseas trade; of these 36.94 per cent were British. A nation-wide telephone service was provided for the first time on Aug. 10, 1938, with the linking of the International Telephone and Telegraph and the Argentina de Telefonos systems.

Government. The Constitution of 1853 vests executive power in a president chosen for a six-year term by 376 electors representing the Provinces and the Federal District. The National Congress consists of a Senate of 30 members elected for nine years by the Provincial legislatures and a Chamber of Deputies of 158 members elected for four years by universal male suffrage. One-third of the Senate retires every three years and one-half of the Chamber every two years. The governors of the Provinces, elected by local suffrage, exercise extensive powers independently of the Federal Government. President in 1938, Dr. Roberto M. Ortiz, who was elected Sept. 5, 1937, and assumed office Feb. 20, 1938.

HISTORY

Ortiz Inaugurated. Dr. Roberto M. Ortiz, elected to succeed President Augustin P. Justo in 1937 (see 1937 YEAR BOOK, p. 53), was sworn into office at Buenos Aires on Feb. 20, 1938, together with the new Vice-President, Dr. Ramón S. Castillo. To the great satisfaction of the Argentine press and public, the new President in his inaugural address affirmed his faith in democracy and solemnly promised to respect civil liberties and constitutional guarantees, many of which had been held in abeyance since the 1930 revolution. He warned against the introduction of international movements into Argentine politics. Declaring that "in present world conditions only strong people can maintain peace and justice," he said he would devote special attention to the development of the nation's armed forces and "moral reserve." Participating in the inaugural ceremonies were six giant U.S. Army bombing planes that had made a record flight from Miami to the Argentine capital, bearing a letter of greeting and congratulation from President Roosevelt to Dr. Ortiz.

President Ortiz appointed a middle-of-the-road cabinet containing several non-political members and one holdover from the preceding ministry. Its composition was: Interior, Diógenes Taboada; Foreign Affairs, José María Cantillo; Finance, Pedro Groppe; Education, Jorge E. Coll; Agriculture, José Padilla; Public Works, Manuel P. Alvarado; War, Brig. Gen. Carlos D. Marquez; Marine, Vice Admiral Leon Scasso. In accordance with the President's democratic policy, his Ministers of Interior and Finance immediately announced the end of the secrecy and censorship that had characterized the Justo Government.

In his first annual message, read at the opening session of the new Congress on May 11, President Ortiz outlined the program adopted for his admin-

istration. The major aim, he said, was restoration of the people's faith in the parliamentary system of democratic government through improving social and economic conditions. He proposed new laws and the amendment of existing ones on social security, wages and hours, education, and sanitation, and the stimulation of economic activity.

Some of these proposals were accepted by Congress during the regular session ending September 30 and a special session which convened on November 21. The President was authorized to fix minimum prices for wheat, corn, and linseed for 1939 if such action were deemed advisable. A law promulgated October 10 provided for liquidation and refinancing of private mortgage debts and revoked the moratorium in force, as an emergency measure, since Oct. 16, 1933. A law for the purchase of the Córdoba Central Railway by the government for 142,000,000 pesos received final approval December 30. Another measure authorized the National Cotton Board to control and regulate the Argentine cotton industry. At the year end the Congress was considering the 1939 budget, a sugar-control bill, uniform salary scales and working conditions for bank employees, and purchase of the Transandean Railway. Decrees issued Nov. 8, 1938, assigned juridical personality to labor and employer organizations.

Congressional Elections. President Ortiz was able to pursue his program with the full co-operation of Congress as a result of the working majority obtained by government candidates in the Chamber of Deputies in the elections of March, 1938. In the previous Congress, the government coalition held a large majority in the Senate while the Chamber was evenly divided between the government and opposition forces, with the result that there were numerous and lengthy delays in enactment of needed legislation. Congressional elections were held in three provinces on March 6 and in the Federal district of Buenos Aires on March 27. The government coalition, comprising the National Democrats (Conservatives), the *Antipersonalista* wing of the Radical party, and the National Front captured 52 of the 81 Chamber seats contested. As a result, it held 83 seats in the Chamber of Deputies against 68 held by the Opposition (Radicals, 63; Socialists, 5) and 7 seats held by Independents. The Radical party, whose control of the Federal government was broken with the overthrow of President Hipólito Irigoyen in 1930, became the largest single party in the Chamber as a result of heavy gains at the expense of its Socialist allies. The Socialists retained only 5 seats out of 23 held in the previous Chamber.

Nazi Propaganda Repressed. The Argentine government and people became alarmed during 1938 at the rapid spread of alien ideologies among foreign elements of the population, and particularly at the spread of Nazism among Argentines of German birth or descent. Early in the year the government received from various sources reports that numerous German-language schools, controlled from Berlin, were instilling Nazi ideology in their pupils, that many children of German immigrants were being raised in ignorance of the Spanish language and of Argentina's democratic institutions and ideals, and that the Hitler salute was in common use among them.

The participation of German nationals in Argentina in the plebiscite on Austro-German union aroused further resentment and on April 10 protest demonstrations were held by Argentine students before the German consulate in Buenos Aires. On

April 28 the Buenos Aires police prohibited a great Nazi mass meeting arranged for May Day and the Federal government forbade the public display of any foreign flags on May Day in order to prevent clashes between Nazis and workmen's organizations. At the same time the government prohibited the transmission over Argentine radio stations of the Nazi "Horst Wessel" song and other foreign marches and patriotic songs considered hostile to Argentine ideals. The transmission of the national anthems of foreign countries was restricted to their officially designated national holidays.

It was reported early in May that the Argentine Foreign Office had informally warned the German Embassy that the government desired the dissolution of the Nazi party in Argentina. The Argentine press meanwhile had launched a vigorous campaign against Nazi and other foreign political activities. The celebration in Buenos Aires on May 25 of the 128th anniversary of Argentina's independence became a spontaneous and impressive demonstration in favor of democracy and against fascism and other anti-democratic ideologies.

President Ortiz on June 16 signed a decree forbidding the teaching of foreign racial or political ideologies, or other beliefs contrary to the Argentine constitution and laws, in foreign language schools, whether public or private. The Argentine flag was to be prominently displayed in all class rooms. New decrees effective October 1 restricted immigration from Germany and other central European countries, while encouragement to agricultural immigrants from Switzerland, Denmark, and the Netherlands was offered under newly signed treaties with those small, democratic countries. Nevertheless, the report of the director of the Germanic Union of Argentina, republished in the Argentine press in September from the *Berliner Tageblatt*, showed a considerable increase in the German population and Nazi activities for the preceding year. According to this report, there were 236,755 persons of German or mixed German-Argentine blood in Argentina, of whom 43,626 were Nazis. German schools numbered 203, German societies 301, and Nazi organizations 102 against 85 in the preceding year.

Rearmament Program. As part of his program for the defense of Argentine democracy, President Ortiz announced plans for further expansion of the navy with ships built in Argentine yards. In connection with steps to develop a stronger air force, Argentina in May engaged a group of U.S. Army Air Corps officers to train its military aviators. The government also requested authority from Congress for the establishment of a national military police of 3000 men to assist in maintaining order and public security, especially in isolated Patagonia. In October it submitted a bill providing for reorganization of the army under a single command and for mobilization of all citizens, male and female, for national service in time of war.

In July President Ortiz took firm steps to subordinate the military to the civilian power and to punish alleged infractions of discipline by the head of the Naval Academy and the director general of the Corps of Engineers.

Economic Conditions. The year 1938 saw a decline in the unusually good high level of business activity and prosperity attained in 1937. There was a moderate decline in foreign trade and government revenues, but the government continued its excellent record in meeting all interest and amortization payments on foreign debts. In order to con-

tinue its large-scale public-works program and to strengthen the foreign exchange reserves of the Central Bank, the government announced April 21 that it had raised short-term loans in Switzerland and the Netherlands for 40,000,000 Swiss francs and 12,500,000 florins, respectively, both bearing 3½ per cent interest. Another loan, the net proceeds of which were \$23,143,750, was floated in New York in November.

Foreign Relations. The pro-democratic policy of the Ortiz Government and its restrictions upon foreign-controlled political movements led to somewhat strained relations with Germany and, to a lesser degree, with Italy. On the other hand, the Argentine Foreign Office achieved notable success in strengthening Argentine relations with all of the neighboring South American States and with the United States.

In appointing Dr. José María Cantilo, then Argentine Ambassador to Italy, to succeed Dr. Carlos Saavedra Lamas as Foreign Minister, President Ortiz was apparently motivated by the desire to end the coolness in Argentine-Brazilian relations produced by Saavedra Lamas's emphatic protests in 1937 against the decision of the United States to lend six over-age destroyers to Brazil for training purposes (see 1937 YEAR BOOK, pp. 54, 105). In April Dr. Cantilo paid a four-day visit to Rio de Janeiro, where he held extended conferences with Foreign Minister Oswaldo Aranha of Brazil and the diplomatic representatives of Chile, Peru and the United States on the Nazi menace to Argentina and Brazil, the Chaco peace problem, and other inter-American issues. His visit served to restore friendly Argentine-Brazilian co-operation.

Dr. Cantilo followed up his success in Rio de Janeiro with a five-day visit to the Chilean capital early in May. One of the last acts of the Justo Government had been the signing of two agreements with Chile, one providing for the freer flow of trade and the other facilitating passenger transit between the two countries. Dr. Cantilo now succeeded in adjusting other outstanding problems in Argentine-Chilean relations. Under agreements signed May 4, the long-standing dispute over the Islands of Nueva, Lennox, and Navarino in the Beagle Channel, Strait of Magellan, was submitted to Attorney General Homer S. Cummings of the United States for arbitration. The ground-work was laid for closer economic and cultural ties and for co-operation in the solution of the Chaco dispute and other inter-American problems. The two governments also agreed to appoint their respective members of the Permanent Mixed Bilateral Chilean-Argentine Commission provided for in the Convention on the Prevention of Controversies, signed Dec. 23, 1936, at the Buenos Aires Conference for the Maintenance of Peace.

The closer co-operation achieved by Dr. Cantilo with Brazil, Chile, Peru, Uruguay, and the United States was influential in promoting the final settlement of the dispute between Bolivia and Paraguay at the Chaco Peace Conference in Buenos Aires on July 21 (see CHACO DISPUTE, SETTLEMENT OF). This resounding triumph was shared by Argentine diplomacy with the inter-American movement for the peaceful settlement of international disputes. It paved the way for the development of closer economic relations with Bolivia, for which Argentine-Bolivian treaties of the previous year had laid the groundwork. On September 8 the Argentine Chamber of Deputies ratified the Argentine-Bolivian boundary treaty signed in 1935.

Steps were also taken toward settlement of Ar-

gentina's controversy with Uruguay over the possession of Martin Garcia Island in the La Plata River. An agreement for maintenance of the status quo pending a final agreement was signed in Buenos Aires in January. Late in September the Uruguayan Foreign Minister visited Buenos Aires and agreed with Foreign Minister Cantilo to submit the dispute to a mixed commission of Argentine and Uruguayan experts. They also agreed on steps toward repression of smuggling, the promotion of cultural relations, and co-operation at the Pan American Conference at Lima in December.

Argentine relations with the United States grew increasingly friendly coincident with a substantial increase in United States exports to Argentina. The engagement of a United States aviation mission in May and President Ortiz's message of September 26 supporting President Roosevelt's previous peace appeal to the heads of the German and Czechoslovak Governments testified to the closeness of Argentine-United States political sympathies. Other Argentine diplomatic moves of the year were the recognition of Italy's sovereignty over Ethiopia on June 2 and the affirmation of Argentina's claim to the Falkland Islands made in President Ortiz's message to Congress on September 25. Some coolness in Argentine-United States relations developed late in the year. A North American grain dealer's effort to dispose of 15,000,000 bu. of United States wheat in Brazil in competition with Argentine grain in November provoked critical outbursts in the Argentine press. At the Pan American Conference the Argentine delegation took the lead in opposing efforts of the United States and certain other delegations to obtain a more specific and emphatic affirmation of inter-American solidarity against ideological or military invasion from abroad.

See BOLIVIA, BRAZIL, CHILE, PARAGUAY, and URUGUAY under *History*; PAN AMERICAN CONFERENCE.

ARIZONA. Area and Population. Area, 113,956 square miles; included (1930) water, 146 square miles. Population: Apr. 1, 1930 (census), 435,573; July 1, 1937 (Federal estimate), 412,000; 1920 (census), 334,162. Phoenix, the capital, had 48,118 (1930).

Agriculture. The accompanying table shows the acreage, production, and value of the chief crops of Arizona for 1938 and 1937.

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1938	205,000	196,000 ^a	\$ 9,506,000
	1937	299,000	313,000 ^a	14,085,000
Hay (tame) ...	1938	199,000	493,000 ^b	3,993,000
	1937	180,000	485,000 ^b	5,820,000
Wheat	1938	45,000	1,100,000	814,000
	1937	45,000	990,000	990,000
Grain sorghums.	1938	35,000	1,102,000	540,000
	1937	39,000	1,112,000	656,000
Corn	1938	33,000	495,000	421,000
	1937	33,000	495,000	426,000

^a Bales. ^b Tons.

Mineral Production. The production, in 1938, of gold, silver, copper, lead, and zinc fell to the total value of \$57,969,000 (preliminary approximation of the Bureau of Mines). This figure, virtually the same as that for 1936, came to 36 per cent less than 1937's total of \$90,855,462. Nearly nine-tenths of the decline occurred in the case of the predominant production of copper. The copper contained in the ore mined in 1938 amounted to some 415,500,000 lb., as against 576,956,000 for 1937. The value of such copper declined yet more, by reason of lower prices, to \$40,719,000, for 1938, from \$69,770,000 for

1937. The output of gold, largely as an incidental element in the ores mined for copper, dropped moderately in quantity, to some 310,000 oz. (1938), from 332,694 (1937). As its value was fixed by statute at \$35, the total by value dropped only to some \$10,850,000, from \$11,644,250. Yearly production of silver declined in quantity to 7,600,264 oz. (1938), from 9,422,552 (1937); the decline of its average price to 64.6 cents an oz. for 1938, from 77.35 cents for 1937, intensified the decline of its yearly total by value. Lead, of which the quantity fell to some 20,600,000 lb. for 1938, from 24,708,000 for 1937, declined more sharply still in value, while zinc of which the production increased in quantity, to some 10,600,000 lb. (1938), from 10,052,000 (1937), also showed a loss in the yearly total of value.

Finance. Arizona's State expenditures in the year ended June 30, 1937, as reported by the U.S. Bureau of the Census, were: For maintaining and operating governmental departments, \$11,826,534 (of which \$1,812,373 was for highways, \$2,559,818 for hospitals, and \$2,136,192 for local education); for interest on debt, \$111,176; for capital outlay, \$7,164,038. Revenues were \$21,320,249. Of these, property taxes furnished \$3,364,702; income taxes, \$1,151,401; sales taxes, \$8,074,173 (including tax on gasoline, \$2,914,090); departmental earnings, \$713,227; sale of licenses, \$1,654,952; unemployment compensation, \$944,952; Federal or other grants-in-aid, \$4,932,305. Funded debt outstanding on June 30, 1937, totaled \$2,932,275; it included \$1,166,523 of old obligations of civil divisions, assumed by the State at its formation, but payable from civil divisions' revenue. Net of sinking-fund assets, funded debt was \$1,597,930. On an assessed valuation of \$359,991,270 the State levied in the year ad-valorem taxes of \$1,878,708.

Education. Inhabitants of school age, as reckoned for the academic year 1937-38, numbered 112,191, aged from 4 to 21 years. Enrollments in public schools totaled 110,056; they comprised 89,708 in the elementary group and 20,348 in high schools. There was also a recorded enrollment of 2135 in private schools. The year's expenditure for public-school education totaled \$11,250,117. This included pay for the 3392 teachers at the average, for the year, of \$1339.36.

Political and Other Events. Robert T. Jones, Dem., was elected Governor on November 8. An incumbent Democratic U.S. Senator, Carl Hayden, and the U.S. Representative were re-elected. The Democrats retained all the chief offices at the election's disposal.

Convicts in the State Prison at Florence escaped to the number of 20 in the course of six weeks previous to July 15. The warden then informed Governor Stanford that he could not control the trouble and asked for help. A force of the National Guard was sent to keep prisoners from departing until additional helpers for the warden could be hired. The escapes were attributed to overcrowding, lack of sufficient guards, and the fact that about one-fourth of the 734 inmates regularly slept outside the walls.

The hazardous trip down Arizona's part of the Colorado River by boat was made in June and July by a scientific party of six persons, including two women botanists from the University of Michigan. Starting at the mouth of the Green River in Utah, the expedition covered the 650 or more miles to Lake Mead without serious mishap.

Officers. Arizona's chief officers, serving in 1938, were: Governor, R. C. Stanford (Dem.);

Secretary of State, James H. Kerby; Attorney-General, Joseph W. Conway; Treasurer, Harry M. Moore; Auditor, Ana C. Frohmiller; Superintendent of Public Education, H. E. Hendrix.

Judiciary. Supreme Court: Chief Justice, A. G. McAlister; Judges, Henry D. Ross, Alfred C. Lockwood.

ARIZONA, UNIVERSITY OF. A coeducational State institution of higher learning in Tucson, Ariz., founded in 1885. The 1938 autumn enrollment totaled 2612, of whom 1615 were men and 997 women; the registration for the summer session of 1938 was 550, of whom 281 were men and 269 women. The teaching faculty numbered 198. The income for 1937-38 was \$1,444,500, the University receiving both State and Federal support. The library contained approximately 110,000 volumes. A building program involving construction of 11 new buildings and remodeling of others, with an expenditure of \$1,491,818, was completed in 1937. President, Alfred Atkinson, D.Sc.

ARKANSAS. Area and Population. Area, 53,335 square miles; included (1930) water, 810 square miles. Population: Apr. 1, 1930 (census), 1,854,482; July 1, 1937 (Federal estimate), 2,048,000; 1920 (census), 1,752,204. Little Rock, the capital, had (1930) 81,679 inhabitants.

Agriculture. The accompanying table shows the acreage, production, and value of the chief crops of Arkansas for 1938 and 1937.

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1938	2,388,000	1,340,000 ^a	\$58,290,000
	1937	3,062,000	1,904,000 ^a	77,386,000
	1938	2,195,000	36,218,000	19,920,000
Corn	1937	2,032,000	40,640,000 ^b	24,384,000
	1938	942,000	980,000 ^b	7,840,000
	1937	852,000	969,000 ^b	9,302,000
Hay (tame) .	1938	189,000	9,450,000	5,292,000
	1937	189,000	10,584,000	6,350,000
	1938	40,000	3,400,000	2,550,000
Potatoes	1937	43,000	3,053,000	2,412,000
	1938	43,000	3,225,000	2,419,000
	1937	37,000	3,515,000	2,847,000
Sweet potatoes	1938	150,000	2,565,000	923,000
	1937	150,000	3,300,000	1,386,000

^a Bales. ^b Tons.

Mineral Production. A decline of some ten years' duration in the petroleum production of Arkansas was at last reversed by additional production in 1937, from the State's part of the Rodessa field. The rise in the yearly output of petroleum to 11,681,000 bbl. (1937), from 10,469,000 (1936), about corresponded with the quantity of new production from the Rodessa field, which was extended into Miller County. New finds of possible importance were reported from the Schuler field in Union County. Natural gas was produced in increasing quantity, mainly by reason of the oil drillers' striking gas in the two new fields. The output of natural gas mounted to 12.5 billion feet for 1937, from 8.5 billion (in value \$1,804,000) for 1936. The State maintained its predominance in the domestic production of bauxite, the clay used as the source of aluminum; its production of bauxite increased to 402,195 long tons (1937), from 354,943 (1936); in value, to \$2,322,861 from \$2,189,196.

Education. The inhabitants of school age (from 6 to 21 years) were reckoned, for 1938, as 630,560. Those enrolled as pupils in the public schools numbered 464,762; this comprised 399,254 in the elementary group and 65,508 in high schools. Expenditure for public-school education in the school year ending in 1937 was: Current, \$9,574,971; total, \$13,346,111. Teachers, principals, and supervisors in that year numbered 12,847; the salary of

the whole group, for the year, averaged \$534. The total included colored teachers, who taught colored classes. The pay of white teachers ran higher than that of colored teachers, as a whole, averaging \$582, as against \$336 for the colored group.

Legislation. A special session of the Legislature, summoned by Governor Bailey, convened on March 10. It dealt chiefly with matters of taxation, highways, and State finance. Both houses voted a resolution recommending seven years' exemption from taxes for incoming industrial enterprises. A bill cutting the tax on gasoline and the fees for automobile licenses was passed, but it was vetoed after bankers had protested that it violated the agreement embodied in the refunding act of 1934, for adjusting the State's debt.

Political and Other Events. The Democratic National and State tickets were elected on November 8. Gov. Carl E. Bailey won another term of office, and Hattie W. Caraway was returned to the U.S. Senate. Republican candidates ran for both offices but concededly without prospect of victory.

Officers. The chief officers of Arkansas, serving in 1938, were: Governor, Carl E. Bailey (Dem.); Lieutenant-Governor, Bob Bailey; Secretary of State, C. G. Hall; Auditor, J. Oscar Humphrey; Treasurer, Earl Page; Attorney-General, Jack Holt; Land Commissioner, Otis Page.

Judiciary. Supreme Court: Chief Justice, Griffin Smith; Associate Justices, Frank Smith, E. L. McHaney, Turner Butler, T. H. Humphrey, Tom M. Mehaffy, Basil Baker.

ARKANSAS, UNIVERSITY OF. A coeducational State institution of higher learning in Fayetteville, Ark., founded in 1871, with a School of Medicine in Little Rock. In the fall of 1938 the total enrollment was over 2600 and for the summer session it was 942. The number of faculty members was 230. The endowment amounted to \$132,000, while the income for the year was estimated at \$900,000 (including medicine). In addition, the University received large sums for work in agricultural extension. The library contained approximately 138,000 volumes. President, John Clinton Futrell.

ARMAMENTS. See AERONAUTICS; DISARMAMENT; MILITARY PROGRESS; NAVAL PROGRESS; FRANCE, GERMANY, GREAT BRITAIN, ITALY, JAPAN, and most of the other countries of the world under *History*; UNITED STATES under *Administration*.

ARMENIAN SOVIET SOCIALIST REPUBLIC. One of the 11 constituent republics of the U.S.S.R., according to the new constitution, adopted Dec. 5, 1936. Area, 11,580 square miles; population, 1,200,000 (1938 estimate), as compared with 1,109,200 (Jan. 1, 1933, census). Chief towns: Erivan (capital), 111,500 inhabitants in 1933; Leninakan, 65,800. In 1938 there were 250,000 pupils attending school; 70,000 students were enrolled in 8 universities and 47 technical schools. In 1938 there were 513,513 acres of spring sowing, by collectives, of chief grain crops. In 1935 the gross production of Armenian industry was valued at 170,000,000 rubles. See UNION OF SOVIET SOCIALIST REPUBLICS.

ART EXHIBITIONS. There was no cessation in exhibitions of art during 1938; to the contrary, they seemed to increase. A good balance was maintained between displays of masterpieces of past centuries and those of works by contemporary artists. Exhibitions of sculpture were more frequent than ever before, and prints also took prominent place, as did in some instances the industrial arts. Furthermore, important exhibitions were held not only in the leading art centers but throughout

the country from the east coast to the west, to say nothing of innumerable little exhibitions held under the auspices of local groups in small towns, eager to advance their cultural standing and to keep in step with the metropolitan centers.

The year opened with exhibitions which laid emphasis on the excellence of work done by early American painters. First among these was that held by the Museum of Fine Arts, Boston, in January, to commemorate the 200th anniversary of the birth of John Singleton Copley (incidentally, variously given as 1737 and 1738), in which works produced in America were given pre-eminence.

The Bicentenary of the birth of Benjamin West was celebrated by an exhibition of his paintings, 60 from all periods, including his most famous "Death of Wolfe," which was held in the Philadelphia Museum in March. In this remarkable collection, drawn from Museums and private collections, was shown the painting by Matthew Pratt of West and his pupils known as "The American School."

John Vanderlyn (1776-1852), another early American painter, was honored by an exhibition of his portraits and other paintings, held in the historic Senate House in Kingston, New York, his native town.

Bringing the history of American painting up to date, the Virginia Museum in Richmond held a memorial exhibition of paintings, prints, and drawings by the late Gari Melchers, who, during his last years, did much to further the establishment of this young, but thriving, institution.

The Whitney Museum of American Art honored Frank Duveneck (1848-1919) by a special exhibition opening in April, and manifesting his genius beyond dispute.

A memorial exhibition of the paintings, chiefly interiors, by Walter Gay (whose death occurred in Paris in July, 1937) was held in the Metropolitan Museum of Art in May.

Later, a comprehensive exhibition of the work of John Sloan, living painter, held in the Addison Gallery of American Art, Andover, Mass., brought the record to date.

The development of American art and the achievement of American painters were exemplified in two exhibitions: "One Hundred Years (1800-1900) of Landscape Painting," shown in the Whitney Museum of American Art, and "Two Hundred Years of American Painting" in the Baltimore Museum.

Likewise retrospective and comparative was an exhibition of "Still Life Painting during the Past Four Centuries" assembled by and set forth in the Wadsworth Atheneum, Hartford, Conn.

The Detroit Institute of Art's annual "Old Masters Exhibition" took the form in 1938 of "A Survey of Italian Gothic and Renaissance Sculpture," drawn from public and private collections in America and surprisingly evidencing their richness in this field as well as in that of painting.

In the California Palace of the Legion of Honor was held a magnificent exhibition of Venetian Painting of the 15th to the 18th centuries, in which were included no less than 77 examples lent by Museums and private collectors.

An important loan exhibition of paintings by Venetian artists was also held at the Knoedler Galleries, New York, in April.

Earlier in the year, the Art Institute of Chicago presented with distinction an exhibition of the work of "The Two Tiepolos," father and son, also garnered from outstanding collections.

In May and June the Carnegie Institute, Pittsburgh, gave "A Survey of British Painting," the interest in which was supplemented by an exhibition in the Jacques Seligmann Galleries, New York, of portraits by Raeburn, borrowed from private owners, and, in many instances, not heretofore publicly shown.

Under the patronage of the Royal Netherlands Legation, an exhibition of "Masterpieces of Dutch Painting" was held in the Museum of the Rhode Island School of Design in December.

Notable exhibitions of Chinese art were held during the year in various Museums throughout the country, as well as at Yamanaka & Company's and in the Arden Gallery in New York. The last was composed of loans from private collections and was held to raise money for Chinese war relief.

During the summer of 1938, 800 superlative examples of French silver were shown in a special exhibition at the Metropolitan Museum of Art, New York.

A unique exhibition of the year was that of architectural models of period rooms by Mrs. James Ward Thorne, shown in the Art Institute of Chicago during the summer months and attracting an attendance of over 60,000.

In the 1938 cycle of exhibitions, the works of French modern artists were not overlooked. In May and June the Philadelphia Museum showed a collection of paintings by Renoir; and later in the year 21 paintings by Cézanne were set forth (for the benefit of a charity) in the Durand-Ruel Galleries, New York.

Contemporary American artists were also brought to attention. The Worcester Art Museum held a biennial exhibition of American Painting in February. In March the Virginia Museum inaugurated its Biennial, at which purchase prizes aggregating \$6000, accrued interest on the John Burton Payne bequest, were awarded by vote of the Board of Directors.

During June the Carnegie Institute, Pittsburgh, held an exhibition of the works of 36 living sculptors, and in December the Museum of Modern Art Gallery of Washington sponsored an excellent showing along somewhat similar lines.

The sculptors and painters themselves in this particular were not listless. The Sculptors Guild very successfully staged an outdoor exhibition of members' works on a vacant lot in the heart of New York in the spring, and in the Brooklyn Museum toward the last of the year. The National Academy of Design and the Pennsylvania Academy of the Fine Arts held annual exhibitions, as has been their custom now for over a hundred years. The leading Water Color Clubs and Print Societies saw to it that works of members and others were thus brought before the public.

Two new elements, the Artists Unions and the contact thus brought about between art and labor, were directly responsible for two unusual exhibitions of the year. In October the first national exhibition of the works by members of Artists Unions was held at the Museum of Fine Arts, Springfield, Mass., while a month earlier the Baltimore Museum, in co-operation with the American Federation of Labor, showed an exhibition of paintings, prints, and sculpture dedicated to Labor and having labor as a theme. The Foreword to the catalogue of this exhibition was written by the President of the American Federation of Labor, Mr. William Green.

By James Earle Fraser

Unveiled May 19, 1938 in Franklin Hall, The Franklin Institute, Philadelphia, Pa.

abroad in 1938. These were a collection assembled by the Museum of Modern Art, New York, at the invitation of the French Government and set forth in the early summer in the Jeu de Paume, Paris; a collection assembled by the Grand Central Galleries Association and shown in the American Pavilion at the International Exhibition in Venice; and an unofficial collection of 51 paintings taken to London and displayed in the Wildenstein Galleries, under British-American management. The first comprised, in addition to 200 paintings in oil and water color, 40 works in sculpture, 80 prints, photographs of architecture designed by Thomas Jefferson, H. H. Richardson, Louis Sullivan, and Frank Lloyd Wright, and also photographs and cinema films. The last two sections received from French critics unstinted praise, but the paintings met, almost without exception, with scathing adverse criticism. The exhibition in Venice, of paintings and prints, met with more favorable reception, as in a measure did that in London, but in neither instance were there entomiums of praise.

ARTISTS. See MUSIC; PAINTING; SCULPTURE.

ART MUSEUMS. The completion of The Cloisters (New York) and their opening to the public in May, 1938, was an event of sufficient importance alone to make the year memorable. Ten years in building, this structure standing in 4 acres of land known as Fort Tryon Park embodies for all time the spirit of medieval art and manifests its significance. It was inspired by the lesser Cloisters which George Grey Barnard (q.v.), the sculptor, built on his own property nearby to house the treasures of medieval and Romanesque art which he had salvaged and brought to this country.

In 1925 John D. Rockefeller, Jr., bought Mr. Barnard's collection for the Metropolitan Museum of Art, and began planning the new Cloisters as a branch museum. Not only was the building and the land it stands on his gift, but through his beneficence, numerous and valuable additions have been made to the collection. And yet at the official opening on May 10th, Mr. Rockefeller spoke of his contribution as "relatively unimportant," because of having been "largely financial." Doubtless he had in mind Barnard, whose death occurred but a few days earlier, on the eve of the realization of his dream, and of the other artists of earlier centuries whose works composed the fabric of this conception.

Cloisters from five French abbeys form the nucleus of this building, to which were added an original chapter house, a reconstructed chapel, a tall Romanesque tower, a modern chapel in Gothic style, and eight exhibition galleries. As a whole, it is "neither copy nor composite," but a reincarnation, achieved by a sympathetic accommodation of material to environment. The miracle was achieved by Charles Collen, architect, working in close co-operation with James J. Rorimer, curator, both holding fast to the germ of Barnard's idea.

Substantial progress was made in 1938 toward the realization of the National Gallery of Art in Washington, given by the late Andrew W. Mellon. The building, designed by John Russell Pope, in construction, took on before the end of the year tangible form. A board of trustees responsible for management was organized, and a Director and a Curator appointed. The former, David E. Finley, was for years closely associated with Mr. Mellon and fully cognizant of his wishes and aspirations in

connection with the development of the Gallery; the latter, John Walker, art expert, was at the time of his appointment assistant director of the American Academy in Rome.

Just before the 1938 session of Congress ended, a bill was passed authorizing the establishment of a Smithsonian Gallery of Art which would stand in somewhat the same relation to the new National Gallery of Art as the Luxembourg Museum does to the Louvre. This bill directed the President to select a suitable site for such a Gallery, appropriated a sufficient sum to pay for its design, and assured future maintenance. No provision, however, was made for building cost, which, it was understood, would be privately contributed. In this Smithsonian Gallery will eventually be housed and displayed the collections given to the nation by Harriet Lane Johnston, William T. Evans, Henry W. Ranger, Ralph Cross Johnson, John Gellatly, and others; the National Portrait Gallery, in which part of the Mellon collection will be included; and works by contemporary artists.

On April 3 a new wing to the Dudley Peter Allen Memorial Museum at Oberlin College, costing \$100,000, the gift of Mrs. F. F. Prentiss of Cleveland, was dedicated. This contains a large auditorium, two additional class rooms, and a photographic laboratory. For the opening, three special exhibitions were arranged.

The Baltimore Museum of Art opened in May a new wing to house the collection of French, English, Dutch, and Italian paintings chiefly of the 17th and 18th centuries, tapestries, miniatures, and *objets d'art* bequeathed to it by Mrs. Henry Barton Jacobs (Mary Frick Jacobs) of Baltimore.

In June, 1938, the Delaware Art Center, erected in Wilmington at a cost of \$250,000, was formally opened. This building, which houses both a Museum and a school, includes a gallery permanently given over to paintings by Howard Pyle, painter, teacher, and illustrator; the Mary R. Bancroft Memorial Gallery containing works by the Pre-Raphaelite painters; the Lavinia Dupont Copeland Gallery for visiting exhibitions; and the Bancroft Library. One hundred thousand dollars was set aside for administrative purposes.

The Ellen Lambert Murphy Memorial, at Winchester, New Hampshire, came into existence in 1938 through the gift of Governor Murphy of New Hampshire, a native son. It consists of two buildings with ample grounds, to serve as a center for recreational and artistic activities, and was opened by an exhibition of paintings by contemporary American artists.

A Fine Arts Building, costing \$160,000, dedicated to the advancement of art, music, and the drama, to be known as Armstrong Hall, was erected on the campus of Cornell College, Mt. Vernon, Iowa.

Under the Works Progress Administration of the Federal Government, the fiftieth Art Center was opened late in 1938. This was in Sacramento, Calif., and, like its 49 predecessors, is an embryo art museum.

The Nicholas Roerich Museum in New York City, established principally to display the paintings of Nicholas Roerich, a gifted Russian artist, traveler, and author, came to an end in the early summer of 1938, changed its name to the Riverside Museum, and announced the intention henceforth of holding transient exhibitions of the works of various contemporary artists.

The City Art Museum, St. Louis, installed in June a complete Hispanic-Moresque interior, dat-

ing from the late 15th century, in connection with an exhibition of this phase of Spanish Art.

The Metropolitan Museum of Art installed in its American Wing two authentic new rooms and two staircases from the Hart and Wentworth houses, Ipswich, Mass.

At the time of its annual summer exhibition, the Lyme Art Gallery, Old Lyme, Conn., opened a new wing, given by Mrs. William O. Goodman of Chicago as a memorial to her late husband.

The Art Institute of Chicago announced in 1938 the gift of \$150,000 from Mrs. William O. Goodman for the completion of the gift by herself and her husband of the Goodman Theatre.

On the death, in September, 1938, of the widow of Martin A. Ryerson, the valuable collection of paintings and art objects which he assembled became, according to his will, the property of the Art Institute of Chicago. The Institute also received, by bequest of Miss Kate M. Buckingham, a trust fund of \$2,000,000.

The Pennsylvania Museum in April changed its name (with permission of the court) to The Philadelphia Museum, to legalize a bequest of \$50,000 for administrative purposes, made to it under this condition by Arthur H. Lea of that city, who died in January. Mr. Lea also left \$50,000 (unconditionally) to the Pennsylvania Academy of Fine Arts, and \$10,000 to the Museum of the University of Pennsylvania.

Princeton University received for its art department an anonymous donation of \$100,000 to bring its Index of Christian Art up to date, and from the estate of the late Dan Fellows Platt, a gift of art books, 6000 lantern slides, and 250,000 photographs of art works and art objects.

The Toledo Museum of Art received a subvention of \$10,000 a year from the Carnegie Corporation of New York for three years, for an educational program along new lines based on use of the Museum's collections.

The Newark Museum received a gift of \$10,000 from Sebastian S. Kresge and the Kresge Foundation to complete payment on property acquired as an annex.

The University of Southern California received from Mrs. Walter Harrison Fisher an Art Gallery and her own private art collection.

The Lawrence Art Museum at Williams College dedicated, in the fall of 1938, a room in memory of Edwin Howland Blashfield, containing a collection of works of art which the famous mural painter had assembled during his lifetime. This room, the gift of his widow, is part of a newly erected addition to the Museum.

Among valuable gifts and bequests received by American Art Museums in 1938 were: The Cleveland Museum of Art—medieval works in sculpture and Near Eastern pottery, from John D. Rockefeller, Jr.; The de Young Museum, San Francisco—13 superb medieval and Renaissance stained-glass windows of the 13th to 16th centuries, from William Randolph Hearst; The Fine Arts Society, San Diego, California—39 paintings, chiefly by noted American artists, by bequest of Mrs. Henry A. Everett; The Virginia Museum—a Brussels tapestry, dating from the first quarter of the 16th century, representing the "Nativity and Adoration of the Magi," an anonymous gift; The E. B. Crocker Art Gallery, Sacramento, Calif.—gifts of textiles and other works of art valued at \$25,000 by Mrs. Alma de Brettville Spreckels; The Metropolitan Museum of Art—six paintings of the 17th and 18th centuries, in addition to a gift of \$100,000,

from the estate of Ogden L. Mills; also "Venus and Adonis," a painting by Rubens, presented by Harry Payne Bingham; The John Herron Art Institute—a gift by Mrs. Albert Beveridge of three paintings, "The Coin Collector" by Hendrick Geritsz Pot, "The Revelers" by Justus van der Ny-poort, and "Portrait of the Marquis d'Ossun" by François Drouais; The Cleveland Museum of Art—"Portrait of a Man" by Ingres, given by Miss E. and Mr. R. L. Ireland; The Museum of Fine Arts, Boston—"Two Dancers" by Degas, given in memory of Horace D. Chapin; The Detroit Institute of Art—"Madonna and Child with Adoring Figure," a superb painting by Giovanni Tiepolo, presented by Edsel B. Ford.

In addition, numerous important purchases were made by American Museums from funds established for such purposes. The Frick Collection purchased a portrait of a "Venetian Senator" by Tintoretto from the Abercorn Collection, and also a painting, "Chestnut Trees at Jas de Bouffan" by Cézanne, the latter its first example of the modern French school, and also works by Boucher and David; The William Rockhill Nelson Gallery in Kansas City acquired "Mont Sainte Victoire" by Cézanne, and a painting, "The Resurrection," a 16th-century Dutch triptych; The Museum of the Rhode Island School of Design bought "St. Peter's Escape," by Karel Fabritius, and The Minneapolis Institute of Art added to its collection a Flemish tapestry of the Gothic period, formerly in the Brady Collection.

Two distinguished works went to Canadian Galleries, the National Gallery at Ottawa purchasing "Christ Blessing Children" by Van Dyck, formerly in the collection of the Duke of Marlborough at Blenheim; and the Toronto Gallery acquiring "Rest in Flight" by Van Orley.

Almost all the Museums made a point of purchasing paintings by contemporary American painters, chiefly those of the modern school. In this the Whitney Museum of American Art, New York, took the lead, expending \$20,000 for works shown in its galleries during 1938. The Metropolitan Museum of Art, New York, made purchases from the Hearn Fund. To the Museum of Modern Art, Mrs. John D. Rockefeller, Jr. donated a fund for such purposes, from which, late in the year, several works were acquired.

The purchase by the City Museum, St. Louis, of a work in sculpture—"Bronze Cat," Egyptian, of about 500 B.C., for \$14,400, brought forth a violent storm of criticism from those of the laboring classes, who held such expenditure criminal when so many were unemployed. Union laborers picketed the City Hall asking for a repeal of the two-mill tax toward the support of the Museum, which is a City institution. The Museum's reply was that "education must not halt because business happens to mark time," together with the statement that since 1929 it had spent \$35,000 a year rejuvenating the Museum, in order to give employment.

Criticism of a somewhat similar nature, though less violent, was occasioned by the purchase of a "Head of the Youthful Hercules," a Greek work dating from the 4th century, B.C., by the Worcester Art Museum, for which reason the director, Mr. Francis H. Taylor, devoted the greater part of his 1938 "Annual" to a "Defense of the Classics."

ART SALES. Outstanding among the Art Sales of 1938 were those of the Mortimer L. Schiff Collection in London, the William Randolph Hearst Collection in New York, London, and at one of his estates in Wales, and the J. Horace Harding

Collection in New York. These occurred respectively in mid-summer and during the last months of the year.

The Mortimer L. Schiff Collection was taken to London, from New York, for sale because his son and executor considered it a better market for the character of works included therein. That it was a good market some of the prices obtained amply evidence. For example, the "Dream of Pope Sergius" by Roger van der Weyden, painted about 1450, brought approximately \$70,000, as great a sum as was realized by the sale of certain well-known collections belonging to great English estates which this year came into the market. A record price of \$7500 was paid for Bernard Van Orley's "Legend of St. Martin" and Johann Koerbecke's "Presentation in the Temple" brought twice that amount. Lucas Cranach's little portrait, 6" by 8" in dimensions, of Johann Friedrich, first elector of Saxony, fetched 1000 guineas; while the circular portrait, 5" in diameter, of Jacquelin de Rohan by Corneille de Lyon, brought 1750. Drawings in this collection, which realized a total of over half a million dollars, also brought high prices. "L'Assemblée au Salon" and "L'Assemblée au Concert" by Lavreince fetched for the pair 3750 guineas.

Five Beauvais tapestries, "Italian Grotesques," sold for 2900 guineas; a Louis XVI marquetry table brought 1850 guineas; and a Savonnerie carpet, Louis XIV period, 2100 guineas. The Limoges enamels alone increased the total by nearly £17,000.

Another American collection sold in London within twelve months of the time of writing was that of English mezzotints assembled by Martin Erdmann of New York, former partner in the banking firm of Speyer, which not only brought £17,234 but did much to revive interest in the art through which portraits by painters of the great English School were beautifully transcribed.

The Hearst Collection was so vast and varied that scarcely an idea of its size or character can be given in brief space. Besides the contents of his numerous palatial estates it included, according to report, 15,000 items which had been stored in a warehouse in New York. These were exhibited, for charity, and disposed of at private sale, filling and refilling a four-story building with purchases removed and replaced as quickly as they were made. These sale prices and also those obtained for works in the Harding collection were not made public. The latter, especially rich in paintings of the Italian, Spanish, and English Schools, could only be seen by appointment. The first public sale of the Hearst Collection began in the Parke-Bernet Galleries, New York, on November 16 and continued for three days; this included chiefly Staffordshire ware and Americana. In December at Christie's in London his collection of old English, Continental, and Mexican silver from his home, St. Donat's Castle in Wales, said to be a museum index to silver-smithing over five centuries, was sold, the receipts from which aggregated £41,882. At this sale two notable pieces were acquired for the Victoria and Albert Museum, London—the "Pusey horn," said to have been given by King Canute to William Pusey, at £1950; and a tankard with cover which fetched £820.

From October, 1937, to mid-summer 1938, the American Art Association-Anderson Galleries recorded a total of \$2,020,974 from 70 sales, and the Parke-Bernet Galleries \$1,251,917 from 40. These figures included sales of books and auto-

graphs but were for the most part for paintings, drawings, prints, and *objets d'art*.

The sale of the Erskine Hewitt collection in October brought in \$98,615.50. At this sale a painting of Wall Street in 1820 by an unknown artist brought the astonishing amount of \$13,500. A portrait of Washington by Sharples and a miniature of him by Ramage each fetched \$1600.

At the sale of the Jay F. Carlisle properties a landscape by Corot "Le Passeur de l'Île Saint-Ouen" brought \$16,000, the largest amount paid for a painting by this artist at a public sale for the last five years.

Most astonishing were the prices paid for prints, in some instances by living print makers. For instance, "Dawn," an etching by James McBey, sold for \$1050 and Muirhead Bone's "Spanish Good Friday" brought \$850. Rembrandt is always a good seller; a fine proof of his "Landscape with three Cottages" brought at public auction \$3100 and his "Christ Crucified," also an excellent impression, \$2800. On the other hand, while Bellow's lithograph "Stag at Sharkey's" brought \$835, Seymour-Haden's lovely etching "Sunset in Ireland" fetched only \$275 and Meryon's "Galerie Notre Dame" but \$210.

ASTRONOMY. Seth B. Nicholson, of the Mount Wilson Observatory, has discovered two new satellites of the planet Jupiter. These are the tenth and eleventh satellites to be discovered, the first four being discovered by Galileo when he invented the telescope. Jupiter X was recorded on photographs made with the 100-inch reflector from July 6 to August 25 and Jupiter XI was followed photographically from July 30 to August 25. Both of these satellites are very faint, being of about the nineteenth magnitude. Nicholson was also the discoverer of Jupiter IX, another nineteenth-magnitude satellite, in 1914 at the Lick Observatory. From its brightness Jupiter IX was inferred to have a diameter of about 25 miles; these two new satellites probably have a similar diameter. The motion of Jupiter X is direct, while that of Jupiter XI is retrograde. Jupiter X has a mean distance of 7,400,000 miles and Jupiter XI one of 15,000,000 miles from the planet. There is some uncertainty about the orbits.

Some years ago the French astrophysicist Lyot succeeded in observing the solar prominences without a spectroscope and the solar corona without an eclipse. He has recently made known some of the results of his work which he has steadily improved with his increasing experience. On his recent spectra, the bright coronal line in the green looks as strong on his photographs taken in broad daylight as it does on many spectra taken during eclipses, when the opportunities for exact measurement are better. Lyot's plates show 11 bright coronal lines, from the ultra-violet at 3388 Å. to two newly discovered lines far in the infra-red at 10,747 Å. and 10,798 Å. Lyot has also succeeded in obtaining direct photographs of the inner part of the corona in full daylight. It will now be possible to learn how the corona changes from day to day and even for shorter intervals, instead of waiting a year or more to find its form completely different between two successive eclipses.

Lyot has photographed solar prominences, with

exposures taken at intervals of one minute, through a red screen but without the aid of a spectroscope or spectroheliograph. The pictures thus obtained at these brief intervals reveal remarkable solar activity. From the main mass of a prominence perhaps 100,000 miles above the sun's surface, great flakes break loose, and fall into the sun. Others stream off sideways, rising at first and then falling along the curve of a great arch. Direct upward motions occur but rarely, those to the side are the most frequent.

At the McMath-Hulbert Observatory in Michigan work is also being done in photographing the solar prominences. Little is known statistically about the frequency with which prominences suddenly disappear at the limb. According to Petit, only about 49 examples of eruptive or active prominences have been studied during the last 50 years, many being caught accidentally rather than through a systematic program. It is obvious that the number counted will depend on how much time is spent in looking for them. Continuous observations such as those taken by Lyot and the McMaths are much superior to those taken with an ordinary spectroheliograph at intervals of three or four minutes. The nature of the forces which cause these extraordinary motions of prominences is hardly understood at all. The luminous matter descending along an arch often appears to be drawn into a sunspot. Much more study is required to take the full advantage of all phases of this new method of observing the prominences.

An eruptive prominence photographed by J. O. Hickox on March 20 with the 13-foot spectroheliograph at Mount Wilson reached the record height of 1,550,000 km. radially above the chromosphere. The prominence seemed to rise from a point on the west limb in the solar latitude N. 75° where a small faint prominence had been present for two days previous to the eruption. Thirty-seven exposures of this prominence were obtained, distributed over a period of 2 hours and 34 minutes. The prominence rose with a uniform velocity of 65 km/sec, which after about an hour was increased to 135 km/sec, and finally to 200 km/sec, thus fulfilling the first law of prominence motion.

Early in the year the *New General Catalog* of the positions and motions of the stars, which had been in preparation for more than 30 years, was completed. This catalogue consists of five volumes and gives the positions for 1950, the proper motions, the magnitudes, and the spectral classes of 33,342 stars. It includes all stars brighter than the seventh magnitude and many fainter ones for which good observations are available. This work was first visualized by Lewis Boss. The task of completing it was enormous. Thousands of observations made since 1755, when Bradley did the first work which meets modern tests of accuracy, had to be collected and reduced to a uniform system; 238 individual catalogues were utilized, each based on original and independent observations. Furthermore, all the stars were re-observed, with every care for the utmost accuracy so that a longer time interval should be available for the determination of their motions. In this part of the program of preparing data for the *Catalog*, the Albany meridian circle was most carefully dismounted, packed, and set up at San Luis in Argentina, where 87,000 observations of southern stars were obtained. It was then returned to Albany, where 110,000 observations of northern stars were secured. Then all this vast mass of data had to be assembled, card-catalogued, discussed with great care to remove all

recognizable sources of error, and finally put in the *Catalog*. The computations were numerous, and to avoid error each one was performed independently a second time.

R. A. Lyttleton has published another paper on the origin of the planets of the solar system. The hypothesis that the sun was formerly one component of a binary star system was considered by him in 1936 with a view to overcoming certain dynamical difficulties of the theory of the origin of the planets. When his idea was put forward, the main problem seemed to be the removal of the companion of the sun and it was to this matter that he gave his chief attention. The following year, however, Luyten and Hill showed that the energy necessary to disrupt such a binary system is only a small fraction of the energy required to remove a mass comparable with that of the planets from the surface of a star similar to the sun. For, in order to satisfy angular momentum requirements, the companion of the sun must have been at a distance from the sun of the order of 4000 solar radii so that the exhaustion of energy per unit mass of the surface material of the companion must have been about 4000 times the amount per unit mass of the binary system. Hence the removal of sufficient material to form the planets from the surfaces of the companion and intruding star requires considerably more energy than the mere disruption of the binary. Luyten and Hill considered the case when the companion and intruder had masses equal to that of the sun and came to the conclusion that no portion of a suitable filament from which the planets could be formed may have less than the escape velocity relative to the sun. Luyten and Hill also considered the case when the intruder is of smaller mass than the companion and arrived at a similar conclusion. Lyttleton has now discussed the only remaining case in which the intruder is more massive than the companion. In his latest contribution, Lyttleton believes that the solar system could have been formed by a close approach to the sun and a companion star of an intruder more massive than the companion. It appears, however, that the origin of the solar system remains one of the unsolved problems of astronomy.

A glowing mass of hydrogen and oxygen gases heretofore undiscovered, which envelops large portions of the Milky Way, has been reported by Otto Struve and C. T. Elvey of the Yerkes Observatory. These luminous nebulosities in the constellations of Cygnus and Cepheus are too faint to be recorded on direct photographs and were found with the new 150-foot nebular spectrograph of the McDonald Observatory of the University of Texas in the Davis Mountains. This newly discovered nebula does not shine by its own light but appears to derive the required energy for its fluorescence from the general field of stellar radiation in the galaxy. It differs from brighter nebulosities in that it is not concentrated toward individual stars. Struve and Elvey consider it probable that many other portions of the Milky Way are covered by similar gaseous nebulae, although an investigation of a region in Canis Major shows practically no trace of nebular emission. The emission decreases very rapidly away from the Milky Way and at galactic latitudes of 20 degrees no emission is found.

The eclipsing pair UX Ursae Majoris has been studied by two Russian observers, Zverev and Kulkarkin. These observers found that sometimes this star, of magnitude 12.7, would be almost invisible while the next observation, made after 20 or 30 minutes, would show the star in its normal bright-

ness. They found that there were regular eclipses occurring at intervals of a little less than five hours, but lasting only 40 minutes. Midway between the deep eclipses, in which 62 per cent of the light is lost, occur shallow ones with a loss of only 7 per cent. Apart from the short period, the light curve of this system is of a standard type. One of the components is 10 times as bright as the other and about 10 per cent larger in diameter. The radii of the two components are 21 and 23 per cent of their distance apart. The most remarkable feature is the density of the components, one, that for the brighter, being 20 times the density of the sun, and the fainter one 11 times the sun's. These are much greater values than have ever before been found from a study of stellar eclipses. They show that here, and for the first time, we have conclusive evidence of the existence of a star intermediate between ordinary stars and the vastly denser white dwarfs. The existence of such stars has long been suspected, for several white stars of spectral class A are known, which, though probably nearly as hot as Sirius, are of only about the sun's brightness; their spectra are somewhat peculiar, and it has been supposed that they were dense bodies. In the case of UX Ursae Majoris, the density has been definitely established.

Another interesting circumstance about UX Ursae Majoris is the fact that this star was found on 71 photographs and each time no variation in its brightness was reported. Each one of these 71 photographs had been taken when the star was not in eclipse.

Alpha Ursae Majoris has been known to be a double star for a very long time. Its period had been determined to be 44 years. When a double star has been followed for one complete revolution it is usually easy to calculate its real orbit. The observations give the apparent orbit of the companion about its primary, but, since the true orbit is usually not seen in plane but more or less edge-wise, allowance must be made for this foreshortening. But in the case of Alpha Ursae Majoris the companion was unobservable for more than three-fourths of its orbit. There was no uncertainty about the period, but only a small portion of the apparent orbit could be drawn. This unusual problem thus presented has been solved by H. Spencer Jones and H. H. Furner. Other sources of data were available: the meridian observations and the radial velocities. By making use of all available data Jones and Furner have succeeded in calculating an orbit. The mean distance between the components is 29 astronomical units, or a little less than Neptune's distance from the sun. The eccentricity of the orbit is 0.35. The components were closest in 1910. The mass of the companion is 31 per cent of the total (3.8 times the sun's mass). The primary is the first red giant star (Class KO) for which we have a visual orbit, and a directly measurable mass. The diameter of the primary is 47 times the sun's.

Epsilon Aurigae has been studied by Kniper, Struve, and Strömberg. This star has long been known to be variable, has been extensively observed and studied previously, and has a period of 27 years. It takes this star 190 days to fall in brightness. It then remains constant at a little less than half its usual brightness for 330 days and then returns to normal in 190 additional days. The same spectrum is visible during the eclipse as when both components are visible. The eclipse is almost grazing. The larger star does not give out perceptible light of its own, and the light of the com-

panion penetrates only the outermost layers of the primary. The eclipse is due to the atmosphere of the primary and not to its main body.

A star, located in the constellation Scorpio, has been shown to be double by Gaposchkin of Harvard. The interest about this is due to the fact that this star is perhaps the largest of its type yet found. Investigations show that its temperature is between 15,000 and 20,000 degrees. Its average magnitude is 6.5; this varies about half a magnitude as the two parts rotate about each other during the star's 12-day period.

Zwicky has continued his observations on the super-nova in IC 4182 which was discovered in 1937. The estimated surface temperature of the central star of this super-nova is over 3,000,000 degrees. Its density is so great that a cubic centimeter of it would weigh about 1240 tons. In a year of observation its light characteristics, as determined by its spectrum, shifted toward the red by an amount of 100 Ångstrom units, a remarkably large displacement attributed to increasing gravitational forces on the star. These observations have caused Zwicky to believe that there are stars in the sky which, although shining, cannot be seen, due to strong gravitational forces. Such stars would be of a type known as collapsed neutron stars and would represent the lowest states of energy which matter could possess without converting it into radiation. Neutron stars would be the final state of super-novae.

Phenomena. Comet 1938 a. After many unsuccessful attempts, Periodic Comet 1927 VI (Gale) was finally discovered on May 1, the first return of this comet and the first comet found during the year.

This year's opposition of periodic Comet 1925 II (Schwassmann-Wachmann) went by unobserved.

There was a total eclipse of the sun on May 29, visible as a total eclipse only in the extreme South Atlantic Ocean, and no expeditions were sent to observe it.

There was a total eclipse of the moon on November 7-8, which was remarkable for two reasons. First, both the sun and the moon were above the horizon at the beginning of the eclipse, due to the fact that atmospheric refraction would make the sun and moon appear above the horizon when actually they were below it. Secondly, there was an occultation of the major planet Uranus during this total eclipse. This occultation had not been predicted, but it was observed during the eclipse.

The total eclipse of the moon on May 14 and the partial eclipse of the sun on November 21-22 had no features of unusual significance.

ATATURK, ä'tä'-türk', (MUSTAFA) KEMAL. The President of Turkey, died at Istanbul, Nov. 10, 1938. Born at Salonica, Mar. 12, 1881, he received his education in the Turkish primary and military schools, at the Military College, and at

the Staff College. During his early career he was associated with the "Young Turks," but after a quarrel with Enver Pasha he resigned. After service in the Turco-Italian War in 1911, he was attached to the Turkish Legation in Sofia in 1913. During the World War he commanded the Northern Section of the Turkish Army at Gallipoli; the 16th Army Corps in the Caucasus (1916); the 2d Army in the Caucasus (1917), and the Turkish Army in Palestine (1918). He was Inspector-General of the Ottoman Forces in Anatolia in 1919.

After the Greek occupation of Smyrna, May 15, 1919, Kemal called together a congress of patriots in opposition, and in July of that year he presided at the Congress of Erzerum. On September 4 he was elected chairman of a congress at Sivas, which resolved "to fight for Turkish integrity." Elected president of New Turkey by the National Assembly in 1920, he organized an army and led it against the Greeks. After two years of fighting he signed an armistice on Oct. 11, 1922. On Nov. 1, 1922, the Sultanate was abolished and after the peace conference at Lausanne declared Turkey a republic, he was elected its first president on Oct. 29, 1923.

He now began the work of transforming Turkey from an agricultural country into an industrial one, and in raising Turkey to a place in the sun among the world powers. His success in the first instance was slow, but after 15 years of effort the government succeeded in establishing cotton mills, a wool factory, a silk factory, a steel and blast furnace works, etc. In the second instance, he was, perhaps, more successful, for in 1936 he succeeded in having the Lausanne Straits Convention of 1923 revised to give him permission to fortify the Straits and to close them to warships of all countries when he was at war, or threatened by aggression. Also, he was instrumental in the formation of the Balkan Entente, his ideal of a Federation which would end the role of the Balkan states as cat's-paws of the great powers, and in 1937 he formed the Moslem or Middle-East Bloc, with Turkey, Iraq, Iran, and Afghanistan. For developments in 1938 see *TURKEY under History*.

In the transition from Old Turkey to New Turkey, many laws and customs were abandoned, and among many things, he abolished the Caliphate, which resulted in the separation of Church and state (1924), the fez, polygamy, and the veil for women (1925 and 1926); introduced new civil and penal codes (1926), the census (1927); and substituted the Roman alphabet for the Arabic (1928). Also, in 1934 he ordered all Turks to register family names, and in accordance with the law, the National Assembly conferred on him the family name of Atatürk (Father of all Turks); he gave the women the franchise (1935); forbade the wearing of clerical garb (1935), and began the preparation of a simplified Turkish language (1935).

AUSTRALIA. A self-governing dominion of the British Commonwealth of Nations. Capital, Canberra.

Area and Population. The area of the six States and two Territories, the census population of June 30, 1933, and the estimated population on Mar. 31, 1938, are shown in the accompanying table.

Living births in 1937 numbered 119,131 (17.43 per 1000); deaths, 64,496 (9.44 per 1000); mar-

AREA AND POPULATION OF AUSTRALIA

States and Territories	Area in sq. miles	Population	
		June 30, 1933	Mar. 31, 1938
New South Wales	309,432	2,600,847	2,717,873
Victoria	87,884	1,820,261	1,865,957
Queensland	670,500	947,534	996,219
South Australia	380,070	580,949	591,755
Western Australia	975,920	438,852	458,453
Tasmania	26,215	227,599	235,540
Northern Territory	523,620	4,850	5,552
Federal Capital Territory	940	8,947	10,499
Total	2,974,581	6,629,839	6,881,848

riages, 59,448 (8.7 per 1000). The excess of immigration over emigration in 1937 was 5203. In the year ended June 30, 1938, 652 more persons of British stock left the country than entered it, whereas the net immigration of aliens was 6769 (2896 Italians, 1078 Greeks, 635 Yugoslavs, 571 Germans, 331 Albanians). Between 1921 and 1937 foreign nationals in Australia increased 32 per cent compared with a 22 per cent increase in immigrants of British nationality. The government in 1938 took steps to reduce alien immigration and encourage that from the British Isles (see *History*).

Estimated populations of the chief cities, all of them State capitals, on Dec. 31, 1937, were: Sydney, N.S.W., 1,279,080; Melbourne, Victoria, 1,024,000; Brisbane, Queensland, 318,430; Adelaide, South Australia, 318,190; Perth, Western Australia, 215,700; Hobart, Tasmania, 62,450. The population of the Federal capital, Canberra, was 8400. Newcastle, N.S.W., had 104,485 inhabitants at the 1933 census.

Education and Religion. Elementary education is free and compulsory. Illiteracy is estimated at about 15 per cent of the adult population. Enrollment in the 10,368 State (public) schools in 1935 was 912,703; in 1875 private schools, 229,525. In 75 free kindergartens (1936) the average attendance was 3914. The six State universities, located at the respective State capitals, had 10,277 matriculated and non-matriculated students attending lectures in 1935.

Religious affiliations of the population at the 1933 census included 2,565,118 members of the Church of England (44.4 per cent), 1,161,455 Roman Catholics (21.1 per cent), not including 127,542 (11.8 per cent) classified as Catholics, undefined; 713,229 Presbyterians (12.3 per cent), and 684,022 Methodists (11.8 per cent).

Production. The estimated gross value of production, by chief industries, for the fiscal years ended June 30, is shown in the accompanying table from the *Quarterly Summary of Australian Statistics*.

VALUE OF AUSTRALIAN PRODUCTION, YEARS ENDED JUNE 30 [In thousands of pounds sterling]

Item	1935	1936	1937 *
Agricultural	£ 68,587	£ 75,388	£ 91,200
Pastoral	74,556	91,286	109,300
Dairy, poultry, bee-farming	44,763	47,533	46,300
Forestry and fisheries	10,856	11,624	12,000
Mining	19,949	23,248	27,400
Manufacturing ^b	137,638	155,891	170,000
Total	£356,349	£404,970	£456,200

* Preliminary. ^b Value added in process of manufacture.

The total area under crops in 1936-37 was 20,602,595 acres, of which 12,316,862 acres were in wheat and 3,100,876 acres in hay. Production of the chief crops in 1936-37 was: Wheat, 151,389,952 bu. (about 187,795,000 bu. in 1937-38); oats, 16,662,279 bu.; corn, 7,246,383 bu.; hay, 3,447,647 tons;

sugar cane, 5,445,740 tons; cane sugar, 782,729 tons. The wine output in 1935-36 was 17,727,958 gal. and the production of all orchards and fruit gardens was valued at £7,701,859. At the end of 1936 there were 110,242,704 sheep, 13,491,072 cattle, 1,762,750 horses, and 1,202,752 swine. The 1937-38 wool clip (as in the grease) totaled about 1,010,000,000 lb. (982,831,449 lb. in 1936-37). Dairy produce in 1936-37 included 395,909,361 lb. of butter, 44,431,415 lb. of cheese, and 73,677,053 lb. of bacon and ham.

The chief minerals produced in 1937 included: Gold, 1,381,135 fine oz., valued at £11,984,088; black coal, 12,074,273 tons (value of black and brown coal in 1936-37, £7,662,222); copper, 19,789 tons, £1,163,413; pig iron, 913,406 tons (in 1936-37); tin, £864,159; lead, 240,036 tons; value of silver and lead, £5,820,112; value of all minerals, £31,970,166 (preliminary) against £27,380,753 in 1936. Manufacturing statistics for 1936-37 were: Number of establishments, 25,688; workers and working proprietors, 523,824; salaries and wages, £90,157,818; value of plant, machinery, land, and buildings, £245,703,232; value of materials used, £260,578,903; net value of production, £177,684,645; value of total manufacturing output, £451,829,278 (£414,688,455 in 1935-36). The value of 1936-37 production of the chief manufacturing industries was: Industrial metals, machines, implements, and conveyances, £52,744,592; food, drink, and tobacco, £36,225,703; clothing, £14,625,535; paper, stationery, printing, bookbinding, etc., £12,794,742; chemicals, dyes, explosives, paints, oils, and greases, £11,312,755; heat, light, and power, £10,763,145.

Foreign Trade. The trend of Australian trade during recent years is shown in the accompanying table. The values are for direct overseas imports and exports, including merchandise, bullion, and specie.

AUSTRALIAN FOREIGN TRADE, YEARS ENDED JUNE 30TH [*British currency values*]

	<i>Imports</i>	<i>Exports</i> *	<i>Balance</i>
1929-30 ...	£ 131,081,320	£ 125,127,148	£ - 5,954,172
1931-32 ...	44,712,868	85,348,607	+ 40,635,739
1934-35 ...	74,119,496	90,225,168	+ 16,105,672
1935-36 ...	85,252,458	108,907,205	+ 23,654,747
1936-37 ...	92,640,462	129,009,810	+ 36,369,348

* Including re-exports.

In Australian currency values, imports in 1937-38 were valued at £140,209,459 (£146,976,636 in 1936-37) and exports at £157,153,041 (£161,557,013 in 1936-37). The value of leading imports in 1937-38 was: Textiles, £15,631,559; machines and machinery, £15,236,975; motor-car chassis and parts, £8,288,839; petroleum, £6,080,165; printing paper, £2,467,264; tea, £2,392,338; tobacco and products, £1,765,770. Among leading exports in 1937-38 were: Greasy wool, £41,272,725; scoured and washed wool, £5,297,159; wheat, £20,910,662; gold, £15,912,286; butter, £10,143,396; lead, pig and in matte, £4,916,787; frozen lamb, £4,645,798; frozen beef, £4,342,750; sheep hides, £3,460,611.

The chief sources of imports in 1937-38 were: United Kingdom, £46,228,674; United States, £17,759,175; Canada, £8,045,130; Netherlands East Indies, £7,530,509. The United Kingdom took exports to the value of £80,641,180; United States, £10,859,622; France, £10,408,590; New Zealand, £7,110,459.

Finance. For the fiscal year ended June 30, 1938, Commonwealth revenues totaled £89,458,154 and expenditures £85,963,421, leaving a surplus of £3,494,733, which was set aside in a trust fund for

defense purposes. Budget estimates for 1938-39 placed expenditures at £93,136,000 and revenue receipts at £93,162,000, leaving a surplus of £26,000.

The Commonwealth's public debt on June 30, 1938, was £390,845,062 and the total debt of the States was £884,180,701, making a combined total of £1,275,025,763, or £184 19s. 2d. per head of population.

Transportation, etc. On June 30, 1937, there were 27,094 miles of Federal and State-owned railway lines and 803 miles of private lines open for general traffic. Traffic train-miles run on all government lines in the fiscal year 1936-37 numbered 72,987,000 (exclusive of "Assistant" and "light" railways). The gross earning of the Federal and State railways in 1936-37 were £43,234,000 and working expenses were £31,287,000. The percentage of net earnings on capital cost of these lines averaged 3.55 for 1936-37. The total highway mileage in 1937 was 482,644 and the number of automobiles was 696,578. During the year ended June 30, 1937, aircraft flew 5,497,401 miles on scheduled services in Australia, carrying 43,242 passengers and 658,885 lb. of freight. With the introduction of flying boats on the London-Sydney air route in June, 1938, the service was increased to three flights weekly in each direction and the time between the two cities was reduced to one week. Commercial radio-telephone service between Australia and the United States was opened Dec. 20, 1938.

Government. Executive power is vested in the King, who acts through a governor-general and a ministry responsible to the Federal Parliament. There is a Senate of 36 members (6 from each State), elected for six years and renewed by half every three years, and a House of Representatives of 74 members apportioned among the States on a population basis and elected for three years. The composition of the House of Representatives following the election of Oct. 23, 1937, was: United Australia Party, 29; Labor, 29; United Country Party, 16. In the Senate the standing was: United Australia Party, 20; Labor, 16. Prime Minister in 1938, Joseph Aloysius Lyons (United Australia Party), heading a United Australia-Country Party coalition government formed Nov. 9, 1934, and re-organized Nov. 29, 1937. Governor-General, Brig. Gen. Alexander Hore Arkwright, Baron Gowrie, who assumed office Jan. 22, 1936.

HISTORY

State Elections. Three State elections held early in 1938 served to confirm the extraordinary stability of political opinion throughout the Commonwealth. The preceding October Prime Minister Lyons's coalition Federal government had been returned to power for the third time in succession (see 1937 YEAR BOOK, p. 63). In the elections held in South Australia on Mar. 19, 1938, in New South Wales on March 26, and in Queensland on April 2 the governments of those States were likewise all returned for a third consecutive term.

The elections in South Australia were fought mainly on strictly local issues involving (1) the action of the Butler Government in increasing the terms of members of the Legislative Assembly and Legislative Council to 5 and 10 years, respectively, a step opposed by the Labor Opposition and many Independents, (2) the betting evil, and (3) the liquor licensing laws. The latter two issues cut across party lines. The final electoral results showed the Butler Government dependent for its continuance in office upon the support of at least five Independents. The standing of the parties in

the new Legislative Assembly, with the former standing in parentheses, was: Liberal-Country League coalition, 15 (28); Labor, 11 (13); Independents, 13 (5). Under a new electoral law, the former 19 multiple member electorates, returning 46 members, were replaced by 39 single member electorates.

The New South Wales elections were marked by a split in the State Labor party's ranks and the entrance into the campaign of six Independent Labor candidates in protest against the radical leadership of the former Labor Premier, J. T. Lang. The return of the United Australia-Country party coalition government with a large majority was regarded as a triumph for Premier B. S. B. Stevens's record of a sound administration under which the State had achieved steady economic progress. Following was the standing of the parties in the new and the old Legislative Assemblies (the latter in parentheses): United Australia party, 37 (37); Country party, 22 (22); Labor party, 28 (29); Independent Labor party, 2 (0); Independents, 1 (2).

Premier William Forgan Smith's moderate Labor Government retained control in Queensland despite the loss of a few seats. The new parliamentary line-up was: Labor, 43 (46 in previous Legislative Assembly); Independent Labor party, 1 (0); Country party, 14 (13); United Australia party, 4 (3).

Cabinet Reorganized. Prime Minister Lyons reconstructed the Federal Cabinet on November 7, adding one new member in the person of Senator G. McLeay and shifting several other members to new positions. The new cabinet line-up was: Prime Minister, Joseph A. Lyons; Vice-President of the Executive Council, Senator McLeay; Commerce, Sir Earle C. G. Page; Attorney General and Industry, R. G. Menzies; Defense, Brigadier Geoffrey A. Street; External Affairs, William M. Hughes; Civil Aviation and Works, Harold V. C. Thorby; Treasurer, R. G. Casey; Postmaster General, A. G. Cameron; Health and Repatriation, Senator H. S. Foll; Territories, J. A. Perkins; Trade and Customs, Thomas W. White; Interior, John McEwen.

Mr. White resigned on the following day when the Prime Minister replaced him on the senior cabinet group with the new Minister of Defense. White declared that he was opposed to the shaping of crucial policies by the senior members of the cabinet. He was succeeded as Minister of Trade and Customs by J. A. Perkins, previously Assistant Minister.

Defense Program. In accordance with the pledges made during the 1937 electoral campaign, the Lyons Government during 1938 took steps to strengthen Australia's defenses on a basis of close co-operation with Great Britain and the other Dominions. On May 6 Parliament passed the Defense Loan Bill authorizing the government to borrow up to £10,000,000 in connection with its £43,000,000 defense program (see 1937 YEAR BOOK, p. 64). This program was further expanded in the 1938-39 budget introduced in Parliament September 21 (see *Finance*). Defense expenditures of all kinds, including civil aviation, were raised to £16,796,000 (about \$67,184,000) from £11,531,000 (\$46,124,000) in 1937-38.

Meanwhile the reorganization and improvement of Australian military, naval, and air forces was proceeding in line with recommendations made by British officers. Maj.-Gen. E. K. Squires was

named British Inspector-General of Australian Military Forces. Early in September Sir Edward Ellington, Marshal of the Royal Air Force, submitted recommendations for the strengthening of the Royal Australian Air Force. On October 4 the Minister of Defense announced an immediate increase in the volunteer militia from 35,000 to 42,000, the new recruits being allotted mainly to new coast artillery units. On December 4 Prime Minister Lyons called for an increase of the militia force to 70,000 men.

After the German-Czechoslovak crisis of September had revealed weaknesses in Australian defenses, particularly in anti-aircraft guns and munitions, the Federal Government made further efforts to speed up and extend its defense preparations. At a meeting of the Australian Loan Council at Canberra October 21-23, Prime Minister Lyons proposed a long-range defense program to be carried out jointly by the Federal and State governments. His request for the creation of an advisory committee representing the Commonwealth, the States, and industry, with authority to give priority to public works of a defensive character, was rejected by the State Premiers as incompatible with State rights. The issue of co-ordinating State and Commonwealth defense measures was left for future decision. However, the Loan Council approved another £4,000,000 defense loan, half of which was to be spent by the Commonwealth and half by the States. This increased total defense expenditures for 1938-39 to more than £20,000,000, or nearly twice the amount expended in 1937-38. On November 15 it was announced that an order for 50 reconnaissance bombardment airplanes had been placed with the Lockheed Aircraft Corp. at Los Angeles, Calif.

Social Insurance Law. The Lyons Government also secured the passage in July of a comprehensive social insurance measure providing 1,850,000 workers and their dependents with sickness and disablement benefits, medical service, and old-age, widows', and orphans' pensions. The law covered all manual workers over 14 years of age and other employees whose income amounted to £365 or less annually. It was scheduled to go into effect Jan. 1, 1939.

New Immigration Policy. In fulfillment of another campaign pledge, Prime Minister Lyons announced on March 7 that his government had adopted a new policy of assisting passages of selected immigrants from the United Kingdom by the partial payment of steamship fares. British Army officers and civil servants in India retiring on pensions were offered half fares to Australia as an inducement for them to settle there. In April, the Minister of Interior placed in effect proposals designed to prevent an influx of non-British aliens and especially to prevent their settling in alien communities.

Other Developments. On January 26 Australia celebrated the sesquicentennial of the establishment at Sydney in 1788 of the first British settlement. The celebrations, which continued until April 25 (Anzac Day), attracted many visitors from all parts of Australia and the Empire. Participating in the ceremonies in Sydney harbor were four American cruisers, one French and one Italian cruiser, one British warship, and a Netherlands gunboat.

A strike of more than 20,000 coal miners tied up production to such an extent during September that ships were chartered to bring more than 100,000 tons of coal from the United Kingdom. The miners demanded a six-hour day, 30-hour week, a pen-

sion of £2 weekly at 60 years of age, improved safety and health regulations, and pay for annual holidays. The issue was submitted to the Federal Arbitration Court after Prime Minister Lyons refused to intervene. The Wheat Industry Assistance Bill, passed in December, provided a home consumption price for wheat to be financed by a sales tax on flour. On November 22 the Attorney General announced that a special session of Parliament would be convoked early in 1939 to formulate amendments to the Federal Constitution. On December 1 the government expressed willingness to receive 15,000 European refugees over a three-year period.

Empire and Foreign Relations. The defense and immigration programs described above reflected the uneasiness among Australians at the aggressive tendencies of Japanese imperialism in the Far East, the mounting danger of a European conflagration that would involve the mother country, and the intensification of Germany's demands for the return of her former colonies, including the Territory of New Guinea, mandated to Australia (see NEW GUINEA, TERRITORY OF). W. M. Hughes, Minister of External Affairs, declared at Sydney in October that Australia would not even consider the suggestion that New Guinea be "surrendered" to any other nation. Official spokesmen made it equally plain that the government was dedicated to upholding the traditional "white Australia" policy. Yet events in Europe and the Far East brought home to Australians the fact that they could not hope to maintain these policies without British support.

This realization made the Labor party's policy of self-sufficiency and isolation increasingly unpopular and led the Lyons Government to consider earnestly methods and machinery for closer military, political, and economic co-operation with Great Britain and the other British Dominions. The initiative toward establishment of machinery for closer Empire co-operation in dealing with foreign affairs was taken by R. G. Menzies, Australian Attorney-General and Minister for Industry, during a visit to London in 1938. The problem was also studied by the British Commonwealth Relations Conference which met at Sydney during the year with over 100 delegates from all parts of the Empire in attendance.

Australia was consulted by the British Government on January 27 on Prime Minister Chamberlain's proposal for opening negotiations for a settlement with Italy. When the Commonwealth Government agreed that the situation required such action, the Labor Opposition demanded that the Federal Parliament be convened immediately to discuss Britain's "new" foreign policy. Prime Minister Lyons refused this request. In August the Australian Minister for External Affairs, W. M. Hughes, strongly criticized the Dominions Office in London as an obstruction to effective consultation between the British and Dominion governments. His demand for a greater Australian share in molding British foreign policy was in contrast with the positions assumed by the Canadian and South African Governments (see CANADA and SOUTH AFRICA, UNION OF, under *History*).

At the height of the European crisis over Czechoslovakia, Prime Minister Lyons on September 29 reiterated previous assurances that his government would back the British Government in its negotiations with Germany. His statement before both houses of Parliament was supported by John Curtin, leader of the Labor party. After the crisis,

Curtin asked the government to state what commitments it had assumed in the event war had broken out. Attorney-General Menzies replied that Britain had not asked for or received any commitments, but that Australia could not remain neutral in a British war. In a move to tighten the Commonwealth's bonds with the mother country, the Lyons Government suggested the appointment (announced October 25) of the Duke of Kent to succeed Lord Gowrie as Governor-General upon the latter's retirement in November, 1939.

The government's desire for close political co-operation with Britain was again reflected in the moderation with which trade negotiations for a revision of the Ottawa Trade Agreement of 1932 were conducted in London from April to August by three senior members of the Australian Cabinet—Sir Earle Page, Attorney-General Menzies, and Minister of Customs White. Their main objectives were to obtain for the Australian manufacturer more complete protection against competition from Great Britain, to safeguard and if possible extend the advantages enjoyed by Australian primary producers in the British market, and to make the system of guaranteed Imperial preferences more elastic so that the Commonwealth Government could more easily negotiate trade agreements with foreign countries.

At the conclusion of the negotiations, it was decided to retain the existing Agreement with minor adjustments designed to pacify both the Australian manufacturers who had protested at British competition under the Agreement and the British manufacturers who contended that the Australian authorities had placed obstacles in the way of their goods in violation of the terms of the Agreement.

Before returning to Australia, the three Ministers participated in the unveiling by King George on July 22 of the Australian war memorial at Villers-Bretonneux, France. In recognition of the community of interest between Australia and the Netherlands East Indies, the Governor-General of Australia and Lady Gowrie paid an official visit to the Governor-General of the Netherlands Indies at Batavia on April 7.

Consult David M. Dow, *Australia Advances* (New York: Funk & Wagnalls Co., 1938).

AUSTRIA. A former independent state of central Europe which was annexed to Germany on Mar. 13, 1938; comprising the Federal city of Vienna and the eight Provinces of Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland. Capital, Vienna.

Area and Population. Austria has an area of 32,369 square miles—slightly smaller than the State of Maine—and a population estimated at 6,754,000 on Dec. 31, 1937 (6,760,233 at the 1934 census). Populations of the chief cities (1934 census) were: Vienna, 1,874,130; Graz, 152,841; Linz (including Kleinmünchen), 108,970; Innsbruck, 61,005; Salzburg, 40,232; Wiener Neustadt, 36,798; Sankt Pölten, 36,247; Klagenfurt, 29,761; Villach, 23,831; Baden, 22,208.

Education and Religion. Illiteracy is estimated at 0.12 per cent of the adult population. Public and private elementary schools in 1936-37 numbered 5300, with 822,857 pupils; secondary schools in 1935-36, 171, with 64,042 pupils; universities in 1935-36, 3 (at Vienna, Graz, and Innsbruck), with 14,901 students. There were also a number of commercial and theological schools and colleges. Of the 1934 census population, 90.57 per cent were Roman Catholics, 4.38 per cent Protestants, and 2.83 per cent Jews (191,481).

Production. Agriculture, manufacturing, mining, and lumbering are the chief occupations. Of the total area, about 24 per cent is arable, 11 per cent in meadows, 4 per cent in pasture, 11.5 per cent in Alpine land, and 38 per cent in forests. The 1937 production of forest industries was 728,240 metric tons of paper, cellulose, mechanical pulp, and cardboard. The output of pig iron was 389,118 metric tons; steel, 649,718 tons; crude oil, 33,010 tons. Hydro-electric plants had a capacity of about 3,400,000 h.p. in 1937. Revenue from foreign tourists in 1937 was estimated at 190,000,000 schillings (about \$35,663,000). Production of other minerals (1937) was, in metric tons: Coal, 230,000; copper, 1800; lead, 10,600; aluminum, 4000. The 1936 output of salt was 192,000 metric tons; manganese (metal content), 23,100 tons; magnesite, 397,800 tons.

Estimated yields of the principal farm crops in 1937 were (in metric tons): Wheat, 393,800; rye, 427,500; barley, 249,700; oats, 413,500; potatoes, 2,786,900; corn, 181,200; beet sugar (1937-38), 139,900. The 1934 livestock census showed 1,209,874 cows, 83,830 bulls, 241,688 oxen, 813,235 calves, 261,217 horses, 2,822,966 swine, and 326,497 goats.

Foreign Trade. Total imports in 1937 were valued at 1,453,581,000 schillings (1,247,193,000 in 1936) and total exports at 1,216,162,000 schillings (952,554,000 in 1936). Germany was the best market for Austrian exports in 1937, taking 14.8 per cent of the total, while Italy, Czechoslovakia, and Rumania followed in the order named. Germany was also the leading source of imports, furnishing 16.1 per cent in 1937. The average exchange rate of the schilling in 1937 was \$0.1877 (\$0.1879 in 1936).

Finance. Budget estimates for 1937 placed total revenue at 1,342,000,000 schillings and total expenditure at 1,382,000,000. Preliminary official returns showed a deficit of 70,710,000 schillings of which 48,250,000 schillings was in the ordinary budget. The 1936 budget showed a surplus of 1,500,000 schillings.

The public debt on Dec. 31, 1937, was reported at 3,482,100,000 schillings (internal, 1,509,200,000; external, 1,972,900,000), compared with a total of 3,691,600,000 schillings on Dec. 31, 1935.

Transportation. Austria in 1938 had about 3685 miles of railway line (2726 miles state owned and operated), 42,121 miles of automobile highways (47,512 automobiles registered Jan. 1, 1938), and airlines connecting Vienna and the other leading cities with all European capitals.

Government. The Constitution of May 1, 1934, declared Austria "A Christian, Federal State on a corporative basis." It provided for an "authoritarian" or Fascist regime, in which the Roman Catholic Church occupied a privileged position. Extensive powers were placed in the hands of the President, elected for seven years by the burgomasters (mayors) of Austria from three candidates selected by the Federal Assembly. He was empowered to appoint and dismiss the Chancellor at his discretion. The press, the theater, and the radio were placed under strict government control. In place of a representative assembly, provision was made for four appointive advisory councils, as follows: (1) A Council of State of 40 to 50 "worthy citizens," (2) a Federal Cultural Council of 30 to 40 representatives of legally recognized churches, educational bodies, sciences, and arts, (3) a Federal Economic Council of 70 to 80 representatives of agriculture, industry, commerce, and finance, and (4) a Provincial Council, including the Governor and a financial representative from each Province. The Fed-

eral Diet, which was to pass on legislation submitted to it by the government, consisted of 20 members of the Council of State, 10 members of the Cultural Council, 20 members of the Economic Council, and 9 members of the Provincial Council. Another body, called the Federal Assembly, was to consist of all the members of the four Councils. Its function was to nominate three candidates for President, to authorize a declaration of war, etc.

President at the beginning of 1938, Dr. Wilhelm Miklas, who was re-elected for a second term on Oct. 9, 1931. The only political party legally recognized was the so-called Patriotic or Fatherland Front, founded by the late Chancellor Dollfuss and headed at the beginning of 1938 by Chancellor Kurt Schuschnigg. See *History* for developments after the incorporation of Austria in Germany.

HISTORY

Anschluss Achieved. The union (*anschluss*) of Austria and Germany, forbidden by the Treaties of St. Germain and Versailles and blocked by the World War victors again in 1922, 1931, and 1934, was consummated on Mar. 13, 1938. Without firing a shot, German troops marched in on invitation of the Austrian Government and took possession. They were greeted by hysterically joyous demonstrations in the Austrian cities and towns. Overwhelmed by the German Fuehrer's skillful use of diplomacy, propaganda, and the threat of armed force, the strong anti-Nazi elements in Austria accepted their fate without more than a verbal protest. Likewise France, Great Britain, and Italy, which had repeatedly affirmed their support of Austria's independence, watched with acquiescent chagrin the establishment of a Germany greater in area and population than that they had crushed in 1918. For centuries before the rise of Prussia, Austria had dominated eastern Europe and especially the other German states. In 1919 it was emasculated economically and politically by the Peace Treaties. In 1938 it was reduced to the status of a mere province in Adolf Hitler's revitalized Third Reich.

Prelude to Surrender. Throughout the stormy postwar years, bitter experience had convinced many Austrians that their country could not live within the narrow confines imposed by the peace settlement. But during 1937 and the first months of 1938, this conviction was belied in part by steady economic recovery, due in part to foreign financial and other assistance. At the beginning of 1938 industrial production was at a higher level than the previous peak year of 1929. Unemployment had declined during 1937, although it rose sharply in the first months of 1938; there were an estimated 600,000 applicants for work at the time *anschluss* was achieved. A highly successful tourist season and other factors had given the country a favorable balance of payments for 1937. Financially, Austria was making greater progress than any of its neighbors.

Although few realized it, Austria's political independence had already been doomed by the Italo-German understanding of 1936. Mussolini had blocked the Nazi putsch in Austria in 1934 (see 1934 YEAR BOOK) by mobilizing troops on the Brenner Pass. But subsequently German aid, purchased at the price of Italy's renunciation of tutelage over Austria, enabled Mussolini to emerge triumphant from the crisis of the Ethiopian War and the economic and financial sanctions imposed by the League of Nations. Under Italian pressure, Chancellor Schuschnigg of Austria concluded the

agreement of July 11, 1936, with Germany. In return for Hitler's recognition of Austria's "sovereignty," Schuschnigg agreed to follow a foreign policy "consonant with Austria's position as a Germanic State."

Nazi efforts to utilize the 1936 "truce" as a means of gaining ascendancy in Austria met stubborn opposition from Schuschnigg and his Clerical-Fascist supporters (see 1937 YEAR BOOK). But meanwhile Nazi propaganda made steady headway. The beginning of 1938 found the Schuschnigg Government hard put to resist demands, backed by constant pressure from Germany, for the admittance of pro-Nazis into the Austrian Government and termination of the drastic police measures against Nazi agitation. Moreover, German officials late in 1937 intimated that they were prepared to liquidate the Austrian question in the near future.

Late in January, 1938, Schuschnigg's police raided headquarters of a pro-Nazi committee in Vienna and seized documentary evidence of a plot to overthrow the Austrian Government by a fake attack upon the German Embassy, thus affording a pretext for pre-arranged armed intervention by German troops already concentrated near the Austrian frontier. The ringleader of the conspiracy was Dr. Leopold Tavs, a Sudeten German serving as secretary of a semi-official committee charged with incorporating the Austrian Nazis in Schuschnigg's Fatherland Front. Tavs was arrested. His papers were reported to have implicated several members of the German Cabinet, and indirectly Hitler himself, in the conspiracy.

The Berchtesgaden Agreement. The miscarriage of this conspiracy and opposition within German army circles to armed intervention led Hitler to adopt other tactics. On February 9 he invited Schuschnigg to a personal conference at Berchtesgaden. Schuschnigg accepted and the historic meeting was held on February 12. Hitler violently accused Schuschnigg of betraying the German people by his resistance to Nazi demands in Austria. He insisted that Schuschnigg accept Dr. Arthur Seyss-Inquart, a prominent Austrian Nazi, as Minister of Interior and of Public Security and that various other steps be taken to end the Austrian Government's repression of Nazi agitation.

Schuschnigg demurred, asserting that only President Miklas held the authority to appoint cabinet ministers. But under Hitler's threat of armed invasion of Austria, he finally agreed to urge President Miklas to include Seyss-Inquart in the government.

Returning to Vienna, Schuschnigg transmitted Hitler's demands to President Miklas. The latter declined to place the Austrian police and internal affairs under Nazi control by giving Seyss-Inquart the Interior and Security portfolios, but agreed to appoint him Minister of Justice. On February 15, Hitler sent an ultimatum declaring that German troops would cross the frontier that midnight unless his original terms were accepted. After a futile effort to obtain assistance from Mussolini, Schuschnigg and Miklas were obliged to yield. That evening the cabinet was reorganized. Dr. Schuschnigg remained Chancellor and Minister of Defense but turned over the important Interior and Security portfolios to Seyss-Inquart. Two other pro-Nazis, Dr. Guido Schmidt and Dr. Ludwig Adamovitch, were included as Ministers of Foreign Affairs and Justice, respectively. The Chancellor sought to safeguard his position in part, however, by appointing Michael Skubl, his trusted

chief of police, as Under-Secretary in the Ministry of Public Security with direct command of the police and gendarmerie.

In further execution of Hitler's demands, the Schuschnigg Government on February 17 proclaimed an amnesty for all Austrian Nazis imprisoned for political crimes. Socialist political offenders were likewise released in an effort to strengthen Schuschnigg's support against the Nazis. It was announced that the Austrian Nazis would not be permitted to form a separate party, but would be allowed to enter the Schuschnigg-led Fatherland Front as a unit. Closer "co-ordination" of the Austrian press with German requirements and suppression of the propaganda for restoration of the Hapsburgs were other concessions Hitler extracted from the hard-pressed Austrian Chancellor.

Schuschnigg agreed to these demands partly because Hitler promised him at Berchtesgaden to reiterate in his forthcoming Reichstag speech his respect for Austrian independence and for the right of the Austrian Government to control domestic political opponents in its own way. This pledge was not fulfilled in Hitler's Reichstag speech of February 20. Meanwhile in Austria the Nazis had interpreted the Berchtesgaden agreement as the beginning of the end of the Schuschnigg regime. Their Storm Troops and Elite Guard illegally paraded in Graz and other cities, clashing repeatedly with members of the Fatherland Front.

In a speech before the Federal Diet on February 24, Dr. Schuschnigg defiantly declared that "Austria must remain Austria" and that his government would make no further concessions beyond the Berchtesgaden agreement. He sent troops into the Nazi centers to check anti-government demonstrations and warned Seyss-Inquart to curb Nazi turbulence. At the same time Schuschnigg was informed that Seyss-Inquart, during a visit to Germany made immediately after his inclusion in the Austrian Cabinet, had received instructions to prepare for a plebiscite on Austria's future in the latter part of the summer.

The Chancellor determined to hold an immediate plebiscite, before Nazi propaganda caused further defections among his supporters. He opened negotiations with the Social Democrats, who had been hostile to his regime since the ruthless crushing of Social Democratic organizations by the Dollfuss Government in 1934, and won a tentative pledge of support. Believing that he could count on at least 65 per cent of the total votes, Schuschnigg then announced on March 9 that a plebiscite would be held March 13. In an effort to increase his majority and scotch the *anschluss* agitation for good, Schuschnigg restricted the voting to persons over 24 years of age, thus excluding the ardently pro-Nazi younger generation. This gave Nazi agitators ground for denouncing the unfairness of the plebiscite.

Hitler's Intervention. Determined to prevent a plebiscite under anti-Nazi auspices, Hitler immediately intervened. Acting on his orders, two Nazi members of the Schuschnigg Cabinet—Seyss-Inquart and Glaise-Horstenau—demanded on March 11 that the plebiscite be canceled. Schuschnigg hesitated but finally capitulated under the threat of German intervention. His cancellation of the plebiscite was followed immediately by a German ultimatum threatening invasion unless he resigned by 6:30 p.m. and permitted the formation of a Nazi-dominated government—two-thirds of the Ministers were to be National Social-

ists. With German troops concentrated on the Austrian frontier, Schuschnigg made a frantic effort to secure Italian, British, and French help.

The failure of the powers to act sealed Austria's fate. That evening (March 11) Chancellor Schuschnigg announced over the radio from Vienna that he had decided to resign rather than plunge Austria into war. "And so I take leave of the Austrian people," he concluded, "with a German word of farewell uttered from the depths of my heart: God protect Austria." Nazi Storm Troops immediately occupied the public buildings in Vienna and other cities.

Late that night President Miklas named Dr. Seyss-Inquart as Chancellor of a new government composed entirely of Nazis and pro-Germans. Seyss-Inquart immediately announced that Austria was "free and National Socialist." He invited German troops into Austria to assist in "the restoration and maintenance of law and order." There was little if any disorder in Austria, but the Germans immediately responded. Some 50,000 armed troops began pouring over the border early on the morning of March 12. Giant Nazi bombers circled over Vienna. The German tide swept over the country, taking over control of cities, towns, and villages. Behind them rode Adolf Hitler, who had left his native Austria as a youth before the World War. At Linz, just across the frontier, Hitler proudly proclaimed the fulfillment of his "divine mission" to restore Austria to the German Reich.

Anschluss was formally consummated by both Austrian and German law on March 13. Austria was declared "a state of the German Reich" and a plebiscite to ratify this decision was called for April 10. President Miklas was forced to resign and Chancellor Seyss-Inquart took over his duties temporarily. Hitler assumed command of the Austrian army and merged it with the German military machine. Meanwhile Hitler's triumphant procession across Austria reached a grand climax in Vienna on March 14, where he addressed a wildly cheering multitude. Psychologically as well as politically, the bulk of the Austrian people appeared to have capitulated to Hitler's dynamic National Socialist doctrine. As foretold in the Fuehrer's *Mein Kampf*, Austria resumed her medieval status as the *Ostmark*—outpost of the Germanic peoples against the Slav races and the historic base for German penetration to the east.

The Co-ordination of Austria. The political, economic, and ideological co-ordination of Austria with the Third Reich was carried out with typical German efficiency and thoroughness. Thousands of anti-Nazis were arrested by the German secret police, including ex-Chancellor Schuschnigg. Given an opportunity to flee Vienna before the Nazi triumph, Schuschnigg replied: "My conscience is clear. I prefer to face my accusers." In August a decree was issued providing for the establishment of a special court to try Schuschnigg and other highly placed members of the deposed regime. A warrant for the arrest of the Hapsburg pretender, Archduke Otto—then in Belgium—was issued March 29.

Many prominent Austrians, including the former cabinet members Maj. Emil Fey (q.v.) and Baron Neustaedter-Stuermer, preferred suicide to the treatment they anticipated from the Nazis. Jews were rapidly weeded from the government service, the theaters, professions, and from many private businesses. All Jewish shops were branded and boycotted in the German-Nazi fashion. Many Jews were beaten and publicly humiliated. The Nurem-

berg laws of September, 1935, were put into effect. On March 26, General Goering, German Commissioner for the Four-Year Plan, ordered the systematic elimination of Jews from Austrian economic life. Refused a means of livelihood within the country, they were forbidden to transfer their wealth abroad. Hundreds fled penniless to neighboring countries. Others, known to have wealthy friends abroad, were forced to pay ransom before they were permitted to leave Austria. The anti-Jewish campaign in Austria was intensified on November 10, following the assassination of a German diplomat in Paris by a Polish Jew. All Vienna's 21 synagogues were destroyed or damaged. Thousands of Jews were arrested and flung in concentration camps. Their stores and homes were wrecked and looted. See Jews.

Hitler appointed Dr. Seyss-Inquart Governor of his new province, but real authority was vested in a German, Josef Buerckel, whom Hitler named Reich Commissioner for Austria. While all opposition was harshly repressed, ceaseless propaganda designed to convince all Austrians of the benefits of the new regime flooded the country. Austrian workers were promised employment and facilities for better vacations and leisure activities organized by the German "Strength Through Joy" movement. Military service was extended and expanded. Austrian youth groups were incorporated into the Hitler Youth movement. The banks, railways, currency, and all other departments of economic activity were merged with their German counterparts. The Austrian schilling was replaced by the German mark at the favorable rate of two marks for three schillings.

The German tariff against Austria was abolished immediately but the Austrian tariff against Germany was retained temporarily to avoid an undue shock to Austrian manufacturing industries. Austria's gold and foreign exchange reserves were appropriated by the Reichsbank. Under General Goering's direction, Austrian production was geared to the needs of Germany's Four-Year Plan for economic self-sufficiency. The more intensive development of Austrian iron ore, timber, magnesite, potash, and other natural resources was undertaken. An extensive public works program was launched, including extension of the Munich-Salzburg highway to Vienna and the Rhine-Danube canal, designed to "put a new face on the development of Austrian economics." The German compulsory work service law was extended to Austria, effective October 1.

The Plebiscite. Nazi repression, promises, and propaganda produced the expected results in the plebiscite of April 10. The question put to both Austrian and German voters was: "Do you approve of the reunification of Austria with Germany as accomplished on March 13, and do you vote for the (Reichstag) list of our Fuehrer Adolf Hitler?" In Austria 4,273,884, or 99.75 per cent, voted "Yes," 10,911 voted "No," and 5125 ballots were spoiled.

The Nazi-Catholic Conflict. An influential factor in the response of the Austrian voters was the statement issued prior to the plebiscite by Cardinal Innitzer and the Austrian Roman Catholic bishops. They declared that they had freely and joyfully decided to vote "Yes" as a national duty and that they expected all good Austrian Catholics to do the same. This statement was issued following assurances of favorable treatment for the Catholic Church from Herr Buerckel. It was read from all Austrian pulpits and widely published in the Nazi co-ordinated press.

When Pope Pius heard of this, he immediately summoned Cardinal Innitzer to Rome and compelled him to issue a partial retraction of his endorsement of the Nazis. In this retraction, the Cardinal said that his endorsement was given with the understanding that all Catholic privileges enjoyed under the now defunct Austro-Vatican Concordat of 1855 would be left untouched. The Nazis, however, refused to permit publication of the Cardinal's retraction in Austria. Consequently most Austrian Catholics went to the polls believing that the Pope as well as their own bishops fully approved of the new regime.

The Austrian hierarchy soon complained that the promises made by Herr Buerckel had not been kept. Its resentment was expressed in a pastoral letter signed by Cardinal Innitzer and the six other Austrian bishops and read in all Catholic pulpits on September 19. The letter declared that the clergy were prevented from serving political prisoners. It strongly criticized the Nazi decrees making civil marriage compulsory and closing the confessional schools. Tension between the Nazis and the hierarchy mounted steadily. The Catholics, including the clergy, were divided between those opposing Nazi measures and doctrines and those favoring non-resistance or even complete acquiescence in Hitler's leadership. Some of the clergy taking the latter view joined the pro-Nazi Workers Organization for Religious Peace. The bishops, however, issued an order prohibiting priests from joining this organization.

On the night of October 7, while the German occupation of the Sudeten districts of Czechoslovakia was in progress, Cardinal Innitzer addressed a service for Catholic Youth in the Cathedral of St. Stephen in Vienna. He declared the church had been deprived of many things in the preceding months and exhorted the youths to persist in their faith and works. Issuing from the cathedral the throng of some 6000 youths demonstrated their support of the Cardinal by singing the hymn of the Association of the Sacred Heart. This manifestation provoked counter-demonstrations from groups of Storm Troopers and Hitler Youth members.

On the following night the Nazi counter demonstrations assumed violent proportions. A mob stoned Cardinal Innitzer's palace, breaking all the windows on the first floor. Fragments of flying glass slightly injured the Cardinal while he knelt at prayer in his private chapel. Another mob stormed the nearby chapter house of the cathedral and wrecked the interior. Six rioters invaded the second floor apartment of Canon Johann Krawanik, aged 50, and hurled him from a window to the ground below. He was taken to a hospital suffering, it was reported, from a fractured thigh and broken legs. The Cardinal's wardrobe, furniture, tapestries, and other objects from the chapter house were heaped in St. Stephen's Square and set on fire. Forty minutes after the occupants of the palace and chapter house called for assistance, the police appeared and brought the demonstration to a close.

The foregoing incidents added fuel to the Nazi-Catholic struggle. On Sunday, October 9, another pastoral letter by Cardinal Innitzer, read in all Vienna churches, instructed Catholic parents how to bring up their children in the Catholic faith under restrictions imposed by the non-religious education law. The letter was regarded in Nazi circles as open defiance of Hitler and his doctrines. The Nazi press, which at first expressed regret for

the attack of October 8 on the Cardinal's palace, now demanded "an end to the Innitzer methods." On October 13, Commissioner Buerckel announced that as a result of "church attacks against the National Socialist party and Adolf Hitler," the Austrian hierarchy's plea for the release of Dr. Schuschnigg would be refused, the proposed amnesty for "religious politicians" postponed, and further preparatory schools for the priesthood prohibited.

The controlled press not only whipped up public sentiment against "political Catholicism," but suggested the desirability of confiscating church properties for public purposes. Six Vienna priests were arrested October 17 on charges of inciting Catholic demonstrations against the government. In a statement read in the Catholic churches October 23, Cardinal Innitzer denied that he had instigated hatred against Hitler, the government or the Nazi party, but insisted that a bishop must carry out his duty to God and the Church.

The widening breach between Church and State in Austria was marked by numerous withdrawals of Roman Catholics from the Church. This trend was facilitated by an order issued by Governor Seyss-Inquart on November 15, repealing the law of August, 1933, which placed serious obstacles in the way of persons desiring to secede from the Church.

A cooling of enthusiasm over Austro-German union was noted in other Austrian circles also. Bitter resentment was reported among Austrian Nazis at the numerous German officials and civilians who took over many of the most profitable and important positions in government and private business. The systematic eradication of cherished Austrian traditions and customs and the German insistence that the Austrians abandon their easy-going ways and get down to hard work also aroused antagonism. But as the Nazi machine consolidated its hold upon the country, such opposition found fewer and fewer opportunities for expression.

Austria's Foreign Debt. On April 29 the German Minister of Economics issued a decree applying in Austria, as of April 30, the German transfer moratorium law of June 9, 1933, as amended, and other German legislation on the treatment of foreign debts. On June 1 the service on Austria's foreign debt was defaulted. This default evoked strong protests, addressed to Berlin, from the United States and from eight other governments—France, Great Britain, Belgium, the Netherlands, Sweden, Denmark, Czechoslovakia, and Switzerland—that had guaranteed various postwar foreign rehabilitation loans to Austria. Austrian debts to the United States totaled \$64,493,480, of which \$26,005,480 was owed to the Washington Government for postwar relief loans and the balance consisted of debts to private American citizens represented by nine different dollar-bond issues floated in the United States by Austrian provinces, municipalities, and public utilities.

Great Britain and some of the other countries having unfavorable trade balances with Germany forced the German Government to agree to reimburse them for any sums paid in respect of their guarantee of Austrian loans. Germany also agreed to meet the full service on British-held Austrian bonds. However, the demands of the United States and other governments not in a position to deduct Austrian loan service funds from payments due German exporters remained unsatisfied.

See GERMANY under *History* for other developments.

AUTHORS' LEAGUE OF AMERICA. A national organization of authors, dramatists, radio writers, and screen writers. It was founded and incorporated in 1912 for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; and disseminating information among them as to their just rights and remedies. The League includes the Dramatists' Guild, the Authors' Guild, the Radio Writers' Guild, and the Screen Writers' Guild. Closely affiliated with it is the Authors' League Fund, an agency formed by the League to meet its obligations with respect to the care of the sick, the aged, and the unfortunate. The officers in 1938-39 were: President, Marc Connelly; vice-president, Elmer Davis; secretary, Inez Haynes Irwin; treasurer, Luise Sillcox. Headquarters are at 6 East Thirty-ninth Street, New York City.

AUTOMOBILE RACING. See SPORTS.

AUTOMOBILES. From the second highest production in its history that of 1937, the highest having been 1929, the automobile industry dropped back in 1938 to its lowest production since 1933. The total cars and trucks turned out by American companies in their domestic and Canadian plants were 2,635,000, a decline under 1937 of 47 per cent. Such was the effect of the recession that began in the fall of 1937 and lasted just about a year, for along with other indices of business, automobile production and sales showed an upturn in the final quarter.

Anticipating the slump in sales of 1938 models, the manufacturers had so curtailed their production, to avoid an overstock in dealers' hands at the end of the model year, that when demand did begin to increase, it was necessary to rush work on the 1939 models and put them on the market earlier than usual. Normally, announcement of new models would have been withheld until shortly before the opening of the National Automobile Show in New York on Armistice Day. Unfortunately for interest in this show and the local shows immediately following, the public was already familiar with the new cars and attendance consequently suffered.

The new model season started with dealers in a far more favorable situation than a year ago. Last winter the dealers had to carry over distressingly large stocks of new and almost new cars. In an effort to mitigate their plight the manufacturers undertook a thing that is without precedent. At the instance of the Ford Motor Company the passenger car building members of the Automobile Manufacturers Association united in the promotion of "National Used Car Exchange Week," to underwrite which, a fund of a million and a quarter was subscribed. The theme of the campaign was "Change your old car for a better one," and the burden of the publicity, the advantages of more modern transportation at exceptionally low cost. The week designated was March 5 to 12 and the first general publicity launched about a week in advance. It proved impossible to accurately appraise the benefits. Some dealers were highly enthusiastic in their reports, others more than displeased.

The year-by-year changes in automobiles habitually reflect the previous model's volume of business. If business was good the changes were few. Presumably the public was well satisfied with the

product. But whether or no, if business was poor there follows an unusual crop of improvements to enhance the appeal of the new line. The 1939 models proved the rule for they have little resemblance to the 1938 cars, whereas the latter had little to distinguish them from their immediate predecessors.

Externally, the most noticeable changes were in the front- and rear-end treatments of the design, a general widening of the body and an increase in glass area. A year ago two cars had grills in the "catwalks" (the spaces between fenders and the hood), as the main or accessory openings for the radiator cooling air. Now 11 more makes have them. Through ducts behind the grills the air is led to a conventional radiator in the accustomed location in most lines. In several cases much of the former opening directly in front of the radiator is covered, but in all there is probably some increase of air-intake area which should make for greater radiator efficiency, so the popular notion that this is merely a style fad is perhaps not quite fair.

Hardly any better reason than that can be given for the more general adoption of head lamps in the fenders, first introduced many years ago by Pierce-Arrow. They were then on top of the fender but now in the nose in front of the wheel. They do better define the width of the car and may give better near light on the road and less offence to approaching drivers unless very badly aimed. Whether they give as good distant light as when mounted higher is a question, and they certainly are more exposed to injury and likelihood of being thrown out of adjustment by a fender bump. Such arguments against them may be expected from those who retain them in the catwalks or on the hood sides.

And better visibility all around was a universal improvement in the 1939 models. Higher and wider windshields and larger side and rear windows will make for greater safety, and the also generally widened front seats will make that seat now as comfortable for three people as the rear seat, since the gear shift in the floor has disappeared. Putting the gear-shift lever under the steering wheel is the outstanding interior change. Hudson has had the "electric hand" under the steering wheel as an option at extra cost for the past four years. Last year Graham, Studebaker, and Nash had vacuum-operated shifts on the dash as optional extras, and Cadillac, La Salle, and Pontiac, mechanical shifts under the steering wheel. This year all but one or two lines have mechanical shifts on the steering column or under the dash as standard equipment. With their adoption by all Ford lines for the first time, hydraulic brakes also became practically universal. Many others had them before and a few have had them for years. So 1938 saw the passing of mechanical brakes as well as the "wobble-stick" gear shift. Another definite trend is what Nash pioneered last year, a combination of ventilating with heating. Many makes this year have made provision that, when a heater is installed, it will not merely circulate the air within the car, but will pass through it only fresh air taken in from above the cowl or, as in the Studebaker, from under the running board. Nash has improved its heater by the addition of a "weather eye," a thermostat that maintains within the car whatever temperature it is set for, regardless of outside temperature.

Many other improvements of greater or less importance were found on the new cars but few real innovations. Packard became the first to use a

transverse shock absorber. Hudson brought out the Autopoise control, a sort of steering stabilizer that tends to hold the wheels on a straight course. Side winds suddenly encountered are less likely to swerve the car and even a front wheel blowout at high speed is less dangerous, it is claimed. The Chrysler lines supplied a safety-signal speedometer that shows a green light at speeds up to 30 miles, amber from 30 to 50, and red over 50 miles an hour. Rotary door latches on Studebaker last year are now on four more. The doors can be closed by pressure without slamming. A sliding panel in the roof, called the sunshine top, heretofore featured in a taxicab, are optional on Oldsmobile, Buick, Cadillac, and La Salle. European cars introduced the practice. Coil rear springs first used on Buick last year were added to Oldsmobile. Chevrolet's diaphragm spring clutch was adopted by Pontiac and Buick. New in their use of independent front-wheel suspension were Plymouth and Dodge. Nash's and Oldsmobile's adoption of hypoid rear axles leaves only four not yet using them. Three more cars adopted alligator hood lids, Pontiac, Nash, and Hudson. Improved front and rear suspensions, steering geometry, engine mountings, overdrives, body mounting and insulation, and automatic carburetor chokes about sum up the important things to which several makers gave attention.

Two more old and honored names in fine automobile construction passed into history this past year—Duesenberg and Pierce-Arrow—victims of the waning demand for very expensive cars, since so much of all that can be wished for is now available for so much less money. A new name, but sponsored by one of the oldest makers, was the Mercury, added to the Ford line to fill the gap between the DeLuxe Ford and the Lincoln-Zephyr. Like the Ford it is a V-8 but of slightly greater horsepower and size. General Motors expanded their lines by adding another six to each of the Pontiac and Oldsmobile products. Willys revived the Overland name, giving it to another four-cylinder car slightly larger and in a price class just above the Willys that has been its only line since the reorganization of the company a few years ago.

Statistics. *Preliminary Facts and Figures of the Automobile Industry* released by the Automobile Manufacturers Association at the end of the year was the source of the figures given in the following:

The total production of cars and trucks in the United States and Canada, mentioned at the start of this résumé as a decline of 47 per cent from the previous year, consisted of 2,110,000 passenger cars and 525,000 motor trucks having wholesale values estimated at \$1,283,000,000 and \$333,000,000, respectively. An added \$980,000,000, as the wholesale value of parts, accessories, and tires for replacement, and service equipment, brought the total of the industry's estimated wholesale business to \$2,596,000,000, which was nearly 41 per cent below that of 1937. Better sales in the fall made the final quarter nearly as good as the last one of 1937. For cars and trucks there was only a 7 per cent difference in number of units sold which gives hope for an output of 3,500,000 vehicles in the calendar year 1939.

Again export business was a heavy factor in total sales, the value of motor vehicles, parts, and tires exported from the United States and Canada amounting to \$286,340,000. The number of motor vehicles sold outside of the United States, including exports from this country and the output of Canadian plants of American firms, was 492,000. While

this was down 28 per cent from the previous year, its percentage of the year's total production was a new high of 18.7 per cent as compared with 13.6 per cent the year earlier. Very nearly one of every five cars produced last year was sold abroad.

There was almost no decline in the number of cars in use—only 1 per cent. The registration of cars in this country was 25,150,000 and trucks 4,250,000. The combined registration of 29,400,000 is now 68 per cent of world registration (42,900,000). Ten years ago this country had 77 per cent of the world's automobiles. That foreign countries are so increasing their use of motor vehicles is partly the result of our extensive sales abroad in the past few years, but mainly because more foreign car manufacturers have adopted mass production methods, bringing car prices within the reach of more buyers.

Employment did not suffer quite so great a decrease as production. The workers in automobile, body, and parts factories averaged last year 304,000 and the weekly payroll \$8,650,000, declines of 41 and 44 per cent, respectively, from the 1937 figures. Also employment was fairly stable as it has been since 1935 when the industry adopted the practice of starting its model year in the late autumn. The low month last year was September with 261,000 employees and the high the November-December average of 412,000. The weekly average payroll increased at the same time from \$8,366,000 to \$13,200,000.

A record that never seems to fall much despite business conditions is the total taxes paid by motor vehicle users. Last year it dropped less than 4 per cent to \$1,525,000,000, and again gasoline taxes made up considerably more than half—\$970,000,000, being the amount collected by Federal, state, and municipal governments. However, the percentage of motor-user taxes to all taxes from all sources, Federal, state, and local, has ceased to mount, being 14 per cent last year.

Truck users continued to bear the heaviest tax burden in proportion to their number. To run the 4,250,000 trucks in use, cost in special motor truck taxes alone \$405,000,000. Other interesting figures concerning truck and bus operation are that they give employment to 3,100,000 drivers, that the number of operators of fleets of five or more was 29,750, and that the trucks in such fleets numbered 929,612. Last year there were 17,000 buses built, bringing the number now in use up to 133,000.

The suppliers of raw materials used by the automobile industry, particularly those from which it is the largest purchaser, inevitably felt the slump in car production, the exception being the petroleum refiners or those who rely on the after-market to car users. Proportionally, however, there was not much change in the percentages of automobile industry purchases to total output. The gasoline used by motor vehicles was 90 per cent of the total refined and was estimated to have been 19,200,000,000 gallons of a retail value, including taxes, of \$3,740,000,000. Other total figures are not available but the automobile industry consumed approximately 80 per cent of the rubber produced, 77 per cent of the plate glass, 37 per cent of the lead, 29 per cent of the nickel, 16 per cent of the steel, 13 per cent of the copper, 10 per cent of the tin, 9 per cent of the aluminum, 9 per cent of the zinc, and 4 per cent of the lumber and hardwood. The railroads of course shipped fewer new cars from the factories to dealers; nevertheless, their carloads of automotive freight declined only 14 per cent to 3,200,000.

Legislation. Comparatively little new legislation that affected motor-vehicle makers, sellers, or users was enacted in 1938. Much of it was gratifying to these interests, more was relatively inconsequential, and none was really disturbing. Many enactments merely amended existing laws the better to carry out their provisions and define their application, or to exempt those not intended to be affected, or to strengthen or clarify enforcement.

Besides reaffirming the Congressional pronouncement against the practice of diverting state funds to other than highway purposes, guaranteeing that the penalties already provided will be continued, it added to the Act of 1936 a section providing that, after two years, the Secretary of Agriculture shall not approve any project submitted by any state that has not enacted and is not enforcing an adequate uniform code of safety, "particularly with respect to the licensing of drivers and the operation of vehicles."

Compulsory motor vehicle inspection was much opposed when first adopted in most of the 23 states that now require it or permit municipalities to do so, but if experience shows it lowers accident records, objections to it on account of cost, inconvenience, and even the possibility of abuses in its administration will have less weight. Last year Mississippi, South Carolina, and the District of Columbia authorized or provided for it once or twice a year.

Compulsory insurance is still in force in Massachusetts, but there only. The more generally accepted way of securing accident compensation where deserved is the safety-responsibility law now in force in 28 states (and District of Columbia), with the adoption of it last year by Illinois, New York, and Virginia. New York made it mandatory 'to revoke operators' licenses and registration certificates upon conviction of criminal negligence in the operation of a motor vehicle resulting in death.

However justifiable its defense may be in any given instance, resentment is prevalent to any diversion of money collected for the privilege of using the highways to other than highway use. The Hayden-Cartwright (Federal-Aid) act, as previously mentioned, discourages it and several states have adopted constitutional amendments prohibiting it. The voters of California, Michigan, and New Hampshire approved such amendments at the November elections.

Such diversions as were voted last year were for unemployment relief:

New York continued its two cents of emergency tax to June 30, 1939; Massachusetts its additional one cent to Apr. 30, 1941; Rhode Island made permanent the third cent of its tax, which was to have been removed July 1, 1938, appropriating it exclusively for relief; and Illinois amended its "Motor Fuel Tax Act" to permit Chicago to apply certain amounts of its allotments to relief and education with the proviso that Federal Aid withheld on that account would be deducted. New Jersey requested the Secretary of Agriculture to reconsider exacting a penalty against that state for diverting highway funds for emergency relief inasmuch as the state's policy is to repay such moneys to the highway fund.

Other state legislation follows:

There were no gasoline tax increases. Registration and driver's license fees and motor carrier taxes remained about the same. Kansas reduced the driver's license. Louisiana passed a new Vehicle Registration License Tax Act which, among other changes, reduced the additional tax on private trucks weighing over 10,000 lb. and provided for reciprocal treatment of out-of-state vehicles. Mississippi brought vehicles operated on any liquid fuel other than gasoline (Diesel-powered being thus included) under fuel and registration permit taxes corresponding to those applying to gasoline-consuming vehicles. Eighteen states now tax Diesel fuel the same as gasoline; 6 tax it but use a separate method of collection; 3 states tax it by imposing an

additional registration fee; 6 tax it in still other ways. Under their definitions of motor fuel 3 states and the District of Columbia could tax Diesel but do not and 6 more could but it is not certain that they do. Only 6 states remain that have no provision for taxing Diesel fuel. One state taxes it at a higher rate than gasoline and some charge a higher registration fee in addition to taxing the fuel. The trend is apparently to give Diesel fuel no advantage from the tax standpoint.

Privilege taxes came in for no increases and Mississippi reduced those on dealers in automobile accessories and tires, car washing, and automobile repair shops, the amounts ranging from a third to a half.

Size and weight limits of trucks were made more liberal in Mississippi, Louisiana, and South Carolina.

There is a trend to bring motor carrier regulation in the different states into agreement with the Federal Motor Carrier Act. Louisiana passed a very similar one for its regulating of common and contract carriers by the Public Service Commission. Mississippi also passed a new act regulating common and contract carriers, their operation, rates, charges, and services, providing a new schedule of fees based on carrying capacity instead of a mileage tax; New York brought motor carriers transporting property for compensation under state regulation, with certain exemptions, and Kentucky imposed a mileage tax on for-hire passenger-carrying motor vehicles and an annual tag tax, both based on seating capacity, replacing former tag, seat, and weight taxes. Kansas exempted from its port of entry law common carriers of passengers operating on regular routes between contiguous cities in "this and another state." Congress amended the Motor Carrier Act of 1935 in accordance with recommendations submitted by the Interstate Commerce Commission to perfect procedure and clarify the act, as a result of hearings held by the I.C.C.

Reciprocity, i.e., according certain privileges to out-of-state vehicles if their home states show the same courtesies, is being more and more extended. Mississippi and Georgia authorized negotiations with other states in that direction and Massachusetts exempted from the excise tax any vehicles registered and customarily kept in another state if that state imposes no such taxes on Massachusetts-registered vehicles.

Ohio enacted a Manufacturer's Certificate of Title law supplemental to and now integral with its Owner's Certificate of Title law that met with such favor from dealers and finance companies as to forecast the possibility of several similar enactments by 1939 legislatures. Twenty-seven other states and the District of Columbia now have Certificate of Title laws and two of them, Arizona and Wisconsin, require a manufacturer's "Certificate of Newness," which is not, however, an integral part of their laws.

Considerable legislation related to the improvement of the different states' highway systems, providing for financing their extension and maintenance, planning studies, and administration authority.

A few general business laws were passed that affected the automobile business in common with others, among them Mississippi's "Fair Trade Act," prohibiting selling below established resale prices, trade mark, branded, or named commodities and Virginia's "Unfair Sales Tax," forbidding advertising for sale or selling under cost.

The most important Federal legislation included:

The Federal-Aid Highway Act of 1938. This authorized the appropriation of \$350,000,000 for the fiscal years ending June 30, 1940, and 1941, with an additional \$8,000,000 for an emergency relief fund to repair highways and bridges damaged or destroyed by floods, hurricanes, etc. The act directed the Chief of the Bureau of Public Roads to investigate and report upon the feasibility of building super-highways not exceeding three north and south and three east and west, and the feasibility of a toll system on such roads.

The "Fair Labor Standards Act." This provided for maximum work weeks at regular rates of 44 hours for the first year after enactment, 42 hours for the second year, and 40 hours for each year thereafter and minimum wages per hour of 25¢ for the first year, 30¢ for the next six years, and 40¢ thereafter, unless a lower (not less than 30¢) is necessary to prevent substantial curtailment of employment. The Act is to be administered by a Wage and Hour Division in the Labor Department under the direction of an administrator. The administrator shall appoint for each interstate industry a committee equally composed of representatives of the public (one of whom shall be chairman), employees, and employers. Motor carriers subject to the I.C.C. are exempt from the maximum-hour requirements. Effective October 1 the Interstate Commerce Commission prescribed a maximum driving day of 10 hours to be followed by an eight-hour off-duty or rest period or a weekly limitation of 60 hours on duty for truck and bus drivers of common and contract carriers.

The Withrow Resolution. This directed the Federal Trade Commission to investigate distribution policies of automobile manufacturers and sales policies of retail dealers. The Commission was to consider the following and report to Congress within a year:

1. The extent, if any, of monopoly and concentration of control in the manufacturing and distribution of automobiles and accessories.

2. The extent, if any, to which unfair and injurious methods are employed, including monopolies, price fixing, or unfair trade practices.

3. The extent, if any, to which the anti-trust laws are being violated.

See BUSINESS REVIEW; INSURANCE; MICHIGAN. **AZERBAIJAN** (ä'zër-bi-jän) **SOVIET SOCIALIST REPUBLIC.** One of the 11 constituent republics of the U.S.S.R., according to the new constitution, adopted Dec. 5, 1936. It includes the Nagorno-Karabakh Autonomous Province and the Nakhichevan Autonomous Soviet Socialist Republic. Area, 32,956 square miles; population (Jan. 1, 1933), 2,891,000. Baku, the capital, had 709,500 inhabitants. During the 1937-38 school year 582,000 pupils were enrolled; there were 80 higher and technical schools. The chief products are kitchen, garden, and vine produce, cotton, grain, silk, and tobacco. The production of raw cotton in 1937 totaled 207,000 tons. In 1938 there were 358,644 acres of spring sowing, by collectives, of chief grain crops. Cattle-breeding occurs in the mountain regions. The production of oil is the most important industry, the output per day, in 1937, totaling 60,000 tons. Fishing, copper, salt, and textiles are other industries. See UNION OF SOVIET SOCIALIST REPUBLICS.

AZORES, a-zōr'z'. A group of nine islands (São Miguel, Santa Maria, Pico, Terceira, São Jorge, Fayal, Graciosa, Flores, and Corvo) 800 miles west of Portugal of which it is, administratively, a province. Area, 922 square miles; population (1930), 253,935. Chief towns: Ponta Delgada, capital, 18,022 inhabitants; Angra, 10,642; Horta, 7643. Oranges, pineapples, olives, grapes, and bananas are the important products. In 1937 there were 600 miles of roads.

During the summer of 1938 Deutsche Lufthansa seaplanes made a number of transatlantic survey flights between the Azores and Port Washington, L. I., in preparation for a regular transatlantic service. In July the Imperial Airways "pickaback" seaplane, *Mercury*, left the Azores for Southampton, Eng., on its return transatlantic survey trip from Port Washington, L. I.

BADMINTON. See SPORTS.

BAHÁ'Í FAITH. A religion upholding the principle of the oneness of mankind and asserting that the world has entered a new cycle of evolution in which will be established a world order and universal peace. Its Herald was Mirza Ali Muhammad, known as the Báb (the Gate), whose announcement on May 23, 1844, revealed the dawn of the new day. The Báb was martyred in the city of Tabriz on July 9, 1850, by order of the government instigated by Mohammedan leaders. Its Author and Source was Bahá'u'lláh (Glory of God), who ascended in 1892 at 'Akká, Syria, after 50 years' imprisonment and exile. Bahá'u'lláh's eldest son 'Abdu'l-Bahá (Servant of Bahá), the appointed Interpreter and Exemplar of the Faith, promulgated its teachings in the Orient and Occident, traveling through Europe and America between 1911 and 1913. Since 1921, Shoghi Effendi, 'Abdu'l-Bahá's grandson, has been Guardian in accordance with 'Abdu'l-Bahá's testament.

The administrative order of the faith contains local, national, and international institutions and is regarded by Bahá'ís as the true pattern of world

unity. The local community elects annually a spiritual assembly of nine members who are responsible for local Bahá'í activities and welfare. The community also elects delegates to an annual meeting at which is elected a national spiritual assembly of nine members. The national assemblies will in future be electoral bodies for the formation of an international assembly, of which the Guardian will be the chairman. During 1938 seven new local spiritual assemblies were established in the United States and Canada, and the number of delegates elected to the thirtieth and subsequent annual conventions was increased from 95 to 171. The contract for external decoration of the gallery story of the House of Worship at Wilmette, Ill., begun in October, 1937, was nearly completed by the end of 1938, and plans have been adopted to finish the external decoration by 1944. American Bahá'ís have established local assemblies in Budapest and Mexico City during the current year. There are now 78 assemblies in North America, with expectation of an increase to 84 by Apr. 21, 1939.

Bahá'í property in America, representing a value of about \$1,230,000, includes the House of Worship at Wilmette, Ill., Green Acre, Eliot, Maine, the Bahá'í Summer School, Geyserville, Calif., a house at Malden, Mass., and the national office, 130 Evergreen Place, West Englewood, N. J.

The Bahá'í literature of fundamental importance includes: *Prayers and Meditations by Bahá'u'lláh*, *Gleanings from the Writings of Bahá'u'lláh*, *Tablet of Iqán* (Book of Certitude), *Hidden Words*, and *Tablets*, by Bahá'u'lláh; *Some Answered Questions*, *Promulgation of Universal Peace*, *Tablets*, and *Mysterious Forces of Civilization*, by 'Abdu'l-Bahá; *Bahá'í Administration and The World Order of Bahá'u'lláh*, by Shoghi Effendi. Official publications in the United States and Canada are: *World Order*, a monthly magazine, *Bahá'í News*, *The Bahá'í World* (a biennial international record). The world center is at Haifa, Palestine.

BAHAMAS, ba-há'maz or ba-há'maz. A group of British islands in the West Indies, extending from Florida to the island of Haiti. Land area, 4400 square miles; population (Jan. 1, 1938, estimate), 66,908 compared with 59,828 (1931 census). The chief islands are New Providence (containing Nassau, the capital); Eleuthera; Andros; Long Island; Abaco; Cat Island; Exuma; Fortune Island group (including Long Cay, Acklin's, and Crooked Islands); Grand Bahama; and Inagua. During 1936 there were 1973 births, 1127 deaths, and 574 marriages.

Production and Trade. Shell (conch and tortoise), sponge, cascarilla bark, tomatoes (raw), sisal, pine timber, and salt are the main products. Livestock (1936) was: Horses, 2300; horned cattle, 2650; sheep, 19,925; goats, 11,282; swine, 6080; poultry, 34,900. In 1936, 2372 steamers and sailing vessels (3,323,623 tons) entered and cleared at the ports of the colony. During the season of 1936-January to March—a total of 19,876 people visited the Bahamas. There were (in 1937) 419 miles of roads. In 1937 total imports were valued at £1,213,544; total exports, £211,636, of which sponge (783,298 lb.) accounted for £95,350.

Government. For 1937 revenue totaled £513,926; expenditure, £419,235; public debt, £188,000. The Bahamas are governed by a governor assisted by an executive council of 9, a nominated legislative council of 9, and an elected house of assembly of 29 members. Governor and Commander-in-Chief, Charles C. F. Dundas (appointed May 21, 1937).

History. The government in June, 1938, was raising loans for the reconstruction of the telephone system (£30,000) and the electrical power system (£35,000) in New Providence. In August the finance committee of the executive council of the house of assembly recommended that the air service to Miami of two planes weekly should be increased to three planes weekly. During the same month the government announced that it intended to reform the election act, notably by the introduction of the ballot box instead of the present system of voting by word of mouth. On December 1, an agreement for a regular all-year steamship service between New York and the Bahamas, to commence in the spring of 1939, was announced by J. H. Jarret, colonial secretary of the Bahamas, who was in New York conferring with officials of the Cunard White Star Line.

BAHREIN ISLANDS. See ARABIA.

BAKER, HOWLAND, AND JARVIS ISLANDS. Three small islands claimed by the United States which fringe the equator in mid-Pacific, situated approximately 1000 miles south and southwest of the Hawaiian Islands. Baker Island is at longitude 176° 31' W., Howland at approximately longitude 177° W., and Jarvis at longitude 160° W. They lie athwart the principal steamship lanes and the proposed Pan American Airways route from Honolulu to New Zealand and Australia. These previously uninhabited islands were occupied as aerological stations during 1936 by the U.S. Department of the Interior (see 1936 YEAR BOOK). An airfield was leveled off at Howland Island in 1937.

BALEARIC ISLANDS. A group of islands in the Mediterranean off the east coast of Spain, forming a province of that country. Area, 1935 square miles; population, estimated Dec. 31, 1934, at 376,735. Capital, Palma (population, 93,014), on Majorca, the largest island of the group. Minorca and Iviza are the other chief islands. When the Spanish civil war broke out in July, 1936, Majorca and Iviza were captured by the Insurgents while Minorca was held by the Loyalist Government. The Insurgent-held islands in 1937 and 1938 were used as a base from which Italian air squadrons raided Barcelona, Valencia, and other Loyalist cities. See SPAIN under *History*.

BALI. See NETHERLANDS INDIES.

BALKAN ENTENTE. A bloc of Balkan states—Greece, Rumania, Turkey, and Yugoslavia—which by the treaty of Feb. 9, 1934, mutually guaranteed their frontiers against aggression by any of the Balkan countries. The treaty bound the four governments to undertake no political action and assume no political obligation toward any Balkan country not a signatory of the pact without the consent of the other contracting parties. In general they agreed to adopt a unified foreign policy on inter-Balkan issues. The entente represented an effort to stabilize the territorial status quo in the Balkans and at the same time to free the Balkan states of their traditional diplomatic dependence upon the great powers.

The Council of the Balkan Entente met at Ankara, Turkey, on Feb. 25–27, 1938, with President Atatürk, the Premiers of Greece, Turkey, and Yugoslavia, and the Rumanian Under-Secretary of Foreign Affairs in attendance. The conference ratified decisions of the preceding Economic Council. It issued a communiqué reaffirming the Entente's solidarity and announcing the following policies: Loyalty to the League of Nations on the basis of equality with other League members;

co-operation with Britain, France, and Italy for peace in the Mediterranean; recognition of Italy's conquest of Ethiopia; maintenance of non-intervention in Spain but the exchange of economic agents with the Insurgent Franco Government; non-interference in internal policies of other states and non-tolerance of interference in their affairs by other states.

The long negotiations of the Balkan Entente for a settlement with Bulgaria led to the conclusion at Salonika on July 31 of a treaty of "perpetual peace and friendship," signed by Premier Metaxas of Greece as President of the Balkan Entente and Premier Kiosseivanov of Bulgaria. The Entente agreed that Bulgaria might restore conscription and rearm at will in return for the latter's pledge to seek revision of her boundaries only by peaceful means (see BULGARIA under *History*). However, the Anglo-French capitulation to Hitler at Munich in September and the partition of Czecho-Slovakia encouraged the agitations in Bulgaria and Hungary for restoration of their lost territories. Late in November the chiefs of the Balkan Entente general staffs met to discuss the rising threat to their territories and to plan for mutual defense against the revisionist powers. However, the increasing economic dependence of all four Balkan powers upon Germany, the development of Nazi movements in Rumania, Greece, and Yugoslavia, and the Reich's growing military power all tended to make these countries pawns of the great powers and to nullify the Entente's basic policy.

See BULGARIA, GERMANY, GREECE, HUNGARY, RUMANIA, TURKEY, YUGOSLAVIA, and other European countries under *History*.

BALKAN STATES. The states of the peninsula south of the Danube, and bounded by the Adriatic, Aegean, and Black Seas. See ALBANIA, BULGARIA, GREECE, RUMANIA, TURKEY, and YUGOSLAVIA.

BALTIC ENTENTE. A bloc comprising the three Baltic States—Estonia, Latvia, and Lithuania—established on a formal basis in 1934 for the mutual protection of their independence and promotion of joint economic, political, and cultural interests. By a treaty signed Sept. 12, 1934, and effective Nov. 30, 1934, the three governments agreed to co-operate on all joint questions of foreign policy, to confer together at least twice annually, to settle their mutual disputes peaceably, and to establish closer unity and collaboration among their diplomatic representatives abroad and at international conferences. All three States had previously concluded non-aggression pacts with the Soviet Union. For developments in 1938, see ESTONIA, LATVIA, and LITHUANIA under *History*.

BANG'S DISEASE ERADICATION. See VETERINARY MEDICINE.

BANKERS ASSOCIATION, THE AMERICAN. The dominant national organization of banks in the United States, having a membership of nearly 14,000 banks out of a total of 15,500. Its four major divisions are devoted to the special interests, technical advancement, and general welfare of the following classes of banks: National, savings, State, and trust company. There also are two sections, the American Institute of Banking section and the State secretaries section. The former, which is the educational arm of the organization, has an enrollment of more than 44,000 students from banks in all parts of the country and a general membership of more than 62,500. The latter forms

a link between the national organization and the 48 State bankers' associations.

The association held its 1938 convention in Houston, Texas, November 14-17. The program took into consideration the importance of the outside point of view and brought together a group of leaders from the fields of business and research who presented a broad survey of the outlook for American business, for business research, for banking, and for American institutions. In addition, the program provided a series of technical discussions at departmental conferences to develop the latest information on the operations side of banking.

The national officers elected for 1937-38 were: President, Philip A. Benson, president of the Dime Savings Bank, Brooklyn, N. Y.; first vice-president, Robert M. Hanes, president of the Wachovia Bank & Trust Company, Winston Salem, N. C.; second vice-president, P. D. Houston, chairman of the board, American National Bank, Nashville, Tenn.; treasurer, M. H. Malott, president of the Citizens Bank, Abilene, Kans.; executive manager, Dr. Harold Stonier; secretary, Richard W. Hill. The national headquarters are at 22 East 40th St., New York City.

BANKRUPTCY. See LAW.

BANKS AND BANKING. A radical change in banking policy was effected during 1938. Whereas the Federal Reserve authorities in the preceding year sought to scale down sharply the excess reserves of member banks of the Federal Reserve System, in order to avoid what they regarded as the threat of excessive credit expansion, the severe recession in business that began late in 1937 led to a drastic reversal of this "tight money policy." At the same time, changes were effected in the rules governing bank examinations by both Federal and State supervisory authorities, so as to permit the acquisition of less liquid and less marketable assets by the individual commercial banks.

This fundamental change in banking policy is likely to have far-reaching significance. It marked a reversal of the more conservative policy initiated in 1936 and early in 1937 by Chairman Eccles of the Board of Governors of the Federal Reserve

a managed monetary system, and caused them to withdraw their opposition to the adoption of a wholly passive program as regards the enormous gold imports. Hence, late in 1938 excess reserves of member banks of the Federal Reserve System had risen to a new peak, materially exceeding the earlier high point of \$3,304,000,000 reached on Dec. 11, 1935. No measures were prepared to offset a further sharp increase in excess reserves toward the \$4,000,000,000 level due to the return flow of currency to the banks after the turn of the year.

The commercial banks of the country responded very slowly to the relaxation of loan and investment restrictions effected as part of the Administration's broad program to stimulate recovery adopted during the spring of 1938. However, the renewed decline in interest rates made the problem of earnings more acute than ever for many commercial banks. Whereas, in the 1935-37 period, substantial recoveries on investments and loans previously written off contributed to a material upturn in bank earning power, this was not the case in 1938, while the persistent decline in interest rates caused current operating income to contract. Earnings from trust departments also tended to decline because of the lower level of security prices and curtailed income from investments. Hence, bank dividends were reduced in many instances, and leaders among commercial bankers regarded the problem of expanding bank earnings as one of the most urgent that they faced.

This problem was intensified by the decline in commercial loans during the year that accompanied the contraction in inventories throughout industry. These commercial loans yielded a relatively high return as compared to Government bonds and most short-term corporate obligations. The more conservative attitude with regard to inventories among business concerns, because of losses taken on excessive stocks accumulated during the preceding year, will cause the rise in bank loans to be relatively slow during the business recovery that began in the last half of 1938.

The principal assets and liabilities of the commercial banks insured by the Federal Deposit Insurance Corporation on June 30, 1938, with comparisons, were as follows:

PRINCIPAL ASSETS AND LIABILITIES OF INSURED COMMERCIAL BANKS

[In thousands of dollars—000 omitted]

	June 30, 1938	Dec. 31, 1937	June 30, 1937	Per cent change from Dec. 31, 1937	Per cent change from June 30, 1937

System and his associates. They had repeatedly asserted that in the management of the nation's credit system they would be as ready to apply curbs when excessive expansion threatened, as to provide the stimulus of large excess reserves for the banks when they felt it desirable to foster business recovery with the spur of easy money. The fact that a very severe decline in business activity and in commodity prices followed so closely upon the adoption of restrictive credit measures, however, undermined the prestige of the advocates of

COMMERCIAL BANKS COVERED BY ABOVE REPORT

Credit Control Policy. The first important step taken in 1938 to reverse the restrictive credit policies that had been pursued by the monetary authorities during the two preceding years was the announcement on February 14 that the Treasury would not sterilize additions to the nation's monetary gold stock in any quarterly period up to \$100,000,000. This meant that acquisitions of gold, chiefly through imports, up to this amount would be paid for by printing gold certificates that would be deposited in the Federal Reserve banks to the Treasury's credit. As these deposits were spent, the reserves of member banks increased accordingly. The adoption of this policy constituted a partial abandonment of the program of sterilizing gold (i.e. not allowing it to increase member bank reserves) by keeping it in the Treasury's inactive gold fund, adopted in December, 1936.

Two months later, as a part of a broad program of stimulating business recovery through a greatly enlarged Government spending program, two expansionist measures were taken by the credit authorities. First, the Treasury discontinued entirely the inactive gold account, and transferred \$1,392,000,000 of gold in the form of certificates to the Federal Reserve banks on April 14. Secondly, legal reserve requirements of member banks, which had been increased in August, 1936, and again in March and May, 1937, so that they were twice the percentages in effect previously, were reduced by an average of approximately 13 per cent. This was designed to increase excess reserves of member banks of the Federal Reserve System by some \$750,000,000. Legal reserve requirements of member banks before and after this action was taken compared as shown in table in next column.

During the summer and fall of the year additional large imports of gold were received in the United States, and the Treasury did not reimburse itself for the cost of this yellow metal immediately by depositing gold certificates with the Federal Reserve banks. Although the inactive gold account

LEGAL RESERVE REQUIREMENTS OF MEMBER BANKS OF THE FEDERAL RESERVE SYSTEM

Classes of member banks and of deposits	Prior to April 16 Per cent	Beginning April 16 Per cent
Demand deposits:		
Central reserve city banks	26	22¾
Reserve city banks	20	17½
Country banks	14	12
Time deposits:		
All classes of member banks	6	5

was not formally re-established, the same effect was obtained by permitting a large amount of gold to accumulate in the Treasury's general account against which no gold certificates were deposited. However, the purpose of this procedure was merely to feed out excess reserves to the banks more gradually, rather than to increase them abruptly and then run the risk of wide fluctuations. Before the end of the year, as already noted, these developments and the further heavy influx of gold resulting from transfers of capital to this country on account of war fears abroad had brought excess reserves to a higher level than ever before.

It will be noted from the above that the Treasury and Board of Governors of the Federal Reserve System, which had been reported at odds over the restrictive credit policy pursued early in 1937, apparently co-operated fully in reversing that policy during 1938. The question of co-ordinating monetary policy for the future received increasing attention, and preliminary discussions of new banking legislation in large part revolved around more centralized control over monetary and credit measures. One step in this direction taken late in the year was the establishment of a temporary Advisory Board on Monetary and Fiscal Problems by President Roosevelt. This advisory board comprised the Secretary of the Treasury, the Chairman of the Board of Governors of the Federal Reserve System, the Acting Director of the Budget and the Chairman of the Natural Resources Committee.

Enormous imports of gold during the fall of the year in connection with the European crisis over Czecho-Slovakia revived discussion of the need for eventually limiting the gold inflow in the interests of effective credit control. Large-scale shifts of "nervous money" to the United States had brought unprecedented imports of the yellow metal since early in 1935, and despite repeated efforts to discover a means for checking these gold arrivals, no effective measures could be found that were not open to serious objections on other grounds. By the end of the year, no progress had been made in solving this vexatious problem, and the expansion of member bank reserves was permitted to go on unchecked.

Excess reserves of member banks of the Federal Reserve System rose from month to month during 1938 as follows:

RESERVE POSITION OF MEMBER BANKS

[In millions of dollars]

End of month	Total reserves	Excess reserves ^a
January	7,237	1,383
February	7,248	1,415
March	7,287	1,546
April	7,623	2,548 ^b
May	7,665	2,568
June	8,024	2,875
July	8,164	3,022
August	8,179	2,941
September	8,198	2,869
October	8,713	3,227
November	8,876	3,383
December	8,724	3,205

^a Estimated. ^b Reserve requirements reduced by a little more than 13 per cent.

Federal Reserve Banks. The only important positive step taken by the Federal Reserve authorities during the year was the lowering of reserve requirements on April 16.

As a result of this reduction of reserve requirements, reserve funds were quite plentiful in all Reserve districts. Changes in the principal assets and liabilities of all Federal Reserve Banks during the year are shown in the following table:

PRINCIPAL ASSETS AND LIABILITIES OF ALL FEDERAL RESERVE BANKS
(In millions of dollars)

End of month	Gold certificates on hand and due from U.S. Treasury	Bills discounted	U.S. Government bonds	Treasury notes	Treasury bills	Federal Reserve notes in actual circulation	Member bank reserve deposits	Treasury deposits

Bank Regulation Changes. The business recession during the late months of 1937 and the early part of 1938 brought renewed criticism from the Administration of the failure of commercial banks to expand their loans rapidly despite their large reserves. Loans reflected a substantial increase until the latter part of 1937, and then they declined rapidly with liquidation of inventories by borrowers. Commercial bankers pointed out that they had every reason to make loans that were reasonably good, in order to increase their earnings, but that they should not make unsound loans. Also officials of the Federal Deposit Insurance Corporation issued warnings against the acquisition of questionable or speculative assets by banks. In addition, Federal and State supervisory authorities, in examining individual institutions, criticized slow and poor quality loans. By contrast, other Administration spokesmen chided the banks for not lending more freely.

Confronted by these conflicting views with regard to the types of loans and investments that they should buy, commercial banks urged upon the Administration the adoption of a more uniform and consistent attitude. In his message to Congress on April 14, announcing his new recovery program, the President expressed the hope that banking supervision would be co-ordinated "to facilitate the flow of credit to commerce, industry and agriculture." A series of conferences of Treasury and banking authorities followed, which resulted in an agreement upon a fundamental revision of bank examination procedure and modification of the regulations of the Comptroller of the Currency applicable to bond investments by member banks of the Federal Reserve System. State banking supervisors agreed to conform to the new methods.

Before the new regulations became effective on April 1, 1938, bank examiners had classified loans as "slow," "doubtful," and "estimated loss." Deductions were made on account of these three categories of loans in determining the net sound capital of a bank, so that commercial bankers were naturally loath to embark upon commitments that would be so classified. Obviously, they could hardly co-operate with the request of the Administration that they make longer-term loans to trade and in-

dustry, if they were to be penalized for such loans in the examiner's report.

The revised examination procedure substituted for these categories of loans a new classification in which the time of expected repayment of the loan no longer played a part. The older ideal of liquidity, to be achieved through short-term maturities, was thus abandoned, and in its place the test of the quality of a bank loan has been made merely the

likelihood of ultimate repayment. In future examination reports, loans are to be classified in the following four categories:

I. Loans or portions thereof the repayment of which appears assured. These loans are not classified in the examination report.

II. Loans or portions thereof which appear to involve a substantial and unreasonable degree of risk to the bank by reason of an unfavorable record or other unsatisfactory characteristics noted in the examiner's comments. There exists in such loans the possibility of future loss to the bank unless they receive the careful and continued attention of the bank's management. No loan is so classified if ultimate repayment seems reasonably assured in view of the sound net worth of the maker or endorser, his earning capacity and character, or the protection of collateral or other security of sound intrinsic value.

III. Loans or portions thereof the ultimate collection of which is doubtful and in which a substantial loss is probable but not yet definitely ascertainable in amount. Loans so classified should receive the vigorous attention of the management with a view to salvaging whatever value may remain.

IV. Loans or portions thereof regarded by the examiner for reasons set forth in his comments as uncollectible and as estimated losses. Amounts so classified should be promptly charged off.

Loans in the first two categories will be counted at full value in examiners' reports. Those in the third category will be reduced by 50 per cent, and those in Class IV will be deducted entirely in computing the net sound capital of a bank.

In the examination of bank bond investments henceforth, four groups of securities will be distinguished. Group I comprises obligations "in which the investment characteristics are not distinctly or predominantly speculative." These securities are to be carried at cost in the examiner's report, without allowance for either appreciation or depreciation. Group II includes securities which are "distinctly or predominantly speculative," as shown by the fact that they are not rated within the four highest grades by recognized rating agencies. Such securities will be valued at the average market price of the 18 months preceding examination, and 50 per cent of any net depreciation shown will be deducted from capital. The full depreciation must be taken on any defaulted securities and on stocks held. Furthermore, the new examination procedure requires that profits realized from the sale of securities must be used to write off investment losses and to establish adequate reserves against bonds

held, unless sufficient provision has already been made for such purpose. Only in that event is bond appreciation available for dividends.

At the same time, the Comptroller of the Currency revised his investment regulations to permit a bank to buy investment securities that had not been publicly distributed but were issued by established commercial or industrial concerns with demonstrated earning power. Such non-marketable securities could be purchased where the maturity was not more than 10 years and where at least 75 per cent of the principal was to be redeemed by periodic amortization payments.

These changes all tended to reduce the insistence of the regulatory authorities upon liquidity and marketability of bank assets, and to place the emphasis instead solely upon likelihood of ultimate repayment. This fundamental and significant change in emphasis was defended on the ground that the ability to obtain advances from the Federal Reserve Banks on all of their assets has made liquidity far less important for the individual bank. Among bankers, however, it was pointed out that individual banks embarked upon such a loan and investment policy with some peril, not only because of the losses they might incur but also because, under a changed management, the Federal Reserve Banks might not readily provide advances to member banks upon poor quality assets, despite the fact that they are authorized to do so in their discretion by the Banking Act of 1935.

A bill to place bank holding companies under strict regulation was introduced in Congress early in the year, but failed of passage despite Administration support. This measure was designed to check the growth of group banking, particularly on the Pacific coast. Near the end of the year, the S.E.C. began delisting proceedings against the Transamerica Corporation, largest bank holding company. This move was interpreted as an attempt to halt the growth of group banking in the Pacific coast area without awaiting special legislation.

Bank Portfolio Policies. The chief change in bank portfolio policy during the year was the contraction of commercial, industrial, and agricultural loans due to the recession in business and widespread reduction of inventories. The banks expanded anew their holdings of high-grade bonds, particularly late in the year.

Bank holdings of direct obligations of the U.S. Government were reduced during the first half of the year, but large new issues of Treasury securities to finance the deficit were freely absorbed by the banks in the closing months. As a result, a substantial increase in Government bond holdings was shown over the full year. The banks bought freely of fully guaranteed bonds of the Federal Government, particularly note issues floated by the

Reconstruction Finance Corporation and the Commodity Credit Corporation. Holdings of corporate securities increased moderately during the year.

The rising trend of business activity during the second half of the year was not accompanied by a material increase in bank loans. In part, this resulted from the fact that loans usually lag behind a rise in business activity, as many concerns are able to finance an initial rise in business out of their own resources and turn to the banks only when the upturn is further advanced. Secondly, a number of corporations were able to repay bank loans while others were expanding their obligations to the banks, owing to inventory liquidation on the upturn.

One problem that received increasing attention among bankers during the year was that of earnings. The further decline in the level of interest rates, the contraction in bank loans, and the fact that recoveries on assets previously written off were declining lowered the earning power of most banks. As a result, dividends were reduced in a number of cases and bank stock prices generally remained at relatively low levels, even after the security market turned upward in the final half of the year. The volume of bank deposits for the country as a whole at the end of the year was very near the 1929 level, but the capital funds of the banks of the country were substantially smaller. Sooner or later, with expanding deposits, a substantial increase in bank capital will be necessary in the interests of conservatism. However, with bank earnings at a relatively low level and declining, it is doubted that it will be possible to raise capital on reasonable terms. Furthermore, with operating expenses tending upward, a number of smaller banks may find that their earning power is inadequate to enable them to continue operations, thus leading to liquidations and to the contraction of banking services available to individuals and business enterprises in many communities.

The number of bank suspensions continued relatively small, and in nearly all instances depositors were protected by Federal deposit insurance. The Federal Deposit Insurance Corporation, unlike other Government agencies, consistently urged the banks to eschew speculative commitments and to pursue conservative investment and lending policies. It is very probable that the liberalization of bank loans and investment restrictions described above would have gone very much further had it not been for the opposition of the Federal Deposit Insurance Corporation to undue laxity in bank portfolio policies.

Changes in loans, investments, and deposits of reporting member banks of the Federal Reserve System, month by month, were as follows, as reported in the *Federal Reserve Bulletin*:

LOANS, INVESTMENTS, AND DEPOSITS OF REPORTING MEMBER BANKS IN 101 LEADING CITIES

BAPTIST CONVENTION, NEGRO. See NATIONAL BAPTIST CONVENTION.

BAPTIST CONVENTION, NORTHERN. This body of the Baptist denomination, according to the *Annual* of the Northern Baptist Convention, was composed in 1938 of 36 conventions in 33 states, the District of Columbia, and Puerto Rico. It reported 403 local associations, 7603 churches, nearly 8000 ordained ministers, 51,139 baptisms during the year, 1,468,043 members, 6341 Sunday schools, and 1,039,870 Sunday school pupils. Church property was valued at \$196,491,545. The contributions for current expenses amounted to \$14,957,043, and for beneficence to \$3,355,169.

The thirty-first annual meeting of the Northern Baptist Convention was held in Milwaukee, Wis., May 26-31, 1938. Its general theme was "I send my church." The officers elected for 1938-39 were: President, Arthur J. Hudson, Cleveland, Ohio; first vice-president, Rev. C. Gordon Brownville, D.D., Pastor of Tremont Temple, Boston, Mass.; second vice-president, Mrs. Howard G. Colwell, Loveland, Colo.; corresponding secretary, the Rev. Maurice A. Levy, D.D., Williamsport, Pa.; recording secretary, the Rev. Clarence M. Gallup, D.D., New York, N. Y.; and treasurer, Harold J. Manson, Brooklyn, N. Y.

In 1938 the Northern Baptist Convention maintained 66 educational institutions, including 10 theological seminaries, 5 training schools, 18 colleges, 12 junior colleges, 11 academies, and 10 Negro schools. These institutions had 34,634 students, 2845 instructors, 750 buildings, property aggregating \$89,835,431 in value, endowments valued at \$130,037,742, and an annual income for the year of \$18,519,349. The leading denominational papers were: *Baptist Observer* (Indianapolis); *Baptist Record* (Pella, Ia.); *Missions* (New York); and *Watchman-Examiner* (New York).

The foreign mission field of the Northern Baptist Convention included Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands, with 522 missionaries. In 1938 churches numbered 3403, with 381,417 members; native workers, 9921; Bible schools, 2836, with an enrollment of 138,955 pupils; and hospitals and dispensaries, 85.

Headquarters of the General Council, the executive body to which is entrusted the work of the Convention between annual meetings, are at 152 Madison Avenue, New York, N. Y. In co-operation with its subsidiaries, the Council of Christian Education, the Council of Finance and Promotion, and the Council of World Evangelization, it administers the unified missionary and educational interests of the denomination and, together with some 27 committees, conducts the principal convention affairs. Two major boards are the Board of Education, which, with assets of \$358,960.21, cares for the work and property of the denominational schools and colleges, and the Ministers and Missionaries Benefit Board, which, with assets of over \$22,000,000, supervises the pension and emergency-aid work for ministers, missionaries, and their dependents. The American Baptist Home Mission Society is situated at 23 East Twenty-sixth Street, New York, N. Y.; the Baptist Young People's Union of America, at 203 North Wabash Avenue, Chicago, Ill.; and the American Baptist Publication Society, at 1701 Chestnut Street, Philadelphia, Pa.

BAPTIST CONVENTION, SOUTHERN. This body of the Baptist denomination was formed in 1845, when Southern Baptists withdrew from

the national organization on account of the slavery issue and also for the better administration of the work of the Convention. Since that time it has functioned, not as a new denomination, but as a separate organization for the purpose of directing missionary, educational, and general denominational work in the white Baptist churches of the Southern and Southwestern States.

According to the official *Handbook* for 1938 the Southern Baptist Convention comprised 18 State conventions, which reported 24,844 churches, 21,689 ordained ministers, 204,567 baptisms during the year, 4,595,602 church members, 23,311 Sunday schools with 3,211,707 Sunday school pupils, and 35,353 Baptist Training Unions with a membership of 742,201. Church property was valued at \$206,668,413. The contributions for current expenses and beneficence totaled \$32,265,687. The receipts of the Convention's boards in 1936 were as follows: Southern Baptist Foreign Mission Board (Richmond, Va.), \$1,077,996; Southern Baptist Home Mission Board (Atlanta, Ga.), \$508,454; Sunday School Board of the Southern Baptist Convention (Nashville, Tenn.), \$1,846,443; and Old Ministers Relief and Annuity Board (Dallas, Tex.), \$513,668.

The denomination maintained 73 schools and colleges, including 5 theological schools, 29 senior colleges, 21 junior colleges, and 18 academies, with a total enrollment of 23,086 students, 2232 ministerial students, and 1594 instructors. The educational endowment amounted to \$22,337,745, and property was valued at \$36,547,604. It also reported 24 hospitals (two fostered by the Southern Baptist Convention and 22 by the State conventions), valued at \$13,832,745 and treating 92,817 patients during the year; 19 children's homes, with property value of \$6,429,877 and accommodating 4147 children; and 3 homes for the aged.

The annual session of the Southern Baptist Convention was held in Richmond, Va., May 12-15, 1938. The various boards and agencies of the convention showed decided gains in receipts for the year. The director of the Work of Promotion in the Executive Committee, Dr. J. E. Dillard, led an "Every Member Canvass" during the week of Nov. 28 to Dec. 4, 1938, with the objective of securing weekly subscriptions totaling \$40,000,000.

The officers elected for 1938-39 were: The Rev. L. R. Scarborough, D.D., LL.D., of Ft. Worth, Tex., president; Dr. Wm. Wistor Hamilton, New Orleans, La., and Mr. Ralph A. Herring, Winston-Salem, N. C., vice-presidents; the Rev. Hight C. Moore, D.D., Litt.D., of Nashville, Tenn., and Mr. J. Henry Burnett of Macon, Ga., recording secretaries; and the Rev. Austin Crouch, D.D., of Nashville, Tenn., executive secretary, and the Rev. J. E. Dillard, D.D., of Nashville, Tenn., secretary of promotion. Headquarters are at 161 Eighth Avenue, North, Nashville, Tenn.

BAR ASSOCIATION, AMERICAN. A national organization, founded in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members.

The Association's sixty-first annual meeting was held in Cleveland, Ohio, July 25-29, 1938. Arthur T. Vanderbilt, the retiring President, spoke at the opening session on "United We Stand." Other addresses and remarks of great interest were made by the Hon. Stanley F. Reed, Associate Justice of the Supreme Court; the Hon. Homer S. Cummings, Attorney-General of the United States; the

Right Hon. Lord Macmillan, Lord of Appeal in Ordinary, London, England; the Hon. Owen J. Roberts, Associate Justice of the Supreme Court; Mr. E. H. Coleman, K.C., the Under-Secretary of State for Canada; the Hon. Joseph B. Eastman, Interstate Commerce Commission; the Hon. William O. Douglas, Chairman of the Securities and Exchange Commission; and Leverett Saltonstall of Boston, Mass.

The membership of the Association in 1938 was approximately 30,800. Its official organ is the *American Bar Association Journal*. Frank J. Hogan, of Washington, D. C., was elected president for 1938-39; John H. Voorhees, of Sioux Falls, S. D., was re-elected treasurer; Harry S. Knight, of Sunbury, Pa., was re-elected secretary; Joseph D. Stecher, of Toledo, Ohio, was re-elected Assistant Secretary; and Thomas B. Gay, of Richmond, Va., was elected chairman of the house of delegates. The headquarters of the Association are at 1140 No. Dearborn St., Chicago, Ill.

BARBADOS, bār-bā'dōz. A British West Indian colony. Area, 166 square miles; population (Jan. 1, 1938, estimate), 190,939. Bridgetown, the capital and chief port, had 15,200 inhabitants. During 1937 there were 5670 births, 3511 deaths, and 946 marriages. The total average attendance in the 137 schools, for the year 1937, was 20,985.

Production and Trade. Sugar (128,239 tons produced in 1937) and cotton are the staple products. The sugar quota for 1938-39 was fixed at 109,200 long tons. In the fishing industry, 250 boats and 1000 persons were employed. For 1937 imports totaled £2,220,650; exports (including re-exports of £148,368), £1,646,709, of which sugar (100,806 tons) accounted for £911,255, and molasses (10,077,390 gal), £554,889. Great Britain supplied 41.2 per cent of the imports and took 43.7 per cent of the exports. In 1937 the 1105 vessels that entered Bridgetown had a net tonnage of 2,055,149. Roads extended 538 miles in 1937. In the same year 6014 tourists visited the colony.

Government. For the fiscal year ended Mar. 31, 1938, revenue amounted to £528,278; expenditure, £546,274; public debt, £442,220; sinking fund, £66,126. Government is administered by a governor, assisted by an executive council, an executive committee, a legislative council of 9 members, and an elected house of assembly of 24 members. Governor, E. J. Waddington (appointed, Jan. 14, 1938).

History. The West Indies Royal Commission, which arrived in Jamaica in October, 1938, was expected to reach Barbados during January. See JAMAICA under History.

A Dutch air service linking Barbados, Trinidad, Dutch West Indies, and Venezuela is to be placed in operation as soon as the airport under construction in Christ Church parish is completed.

BARLEY. The production in 1937 of 35 countries reporting to the International Institute of Agriculture was 1,401,037,000 bu., 11.2 per cent above the production in 1937 and 14.3 per cent larger than the average yield for the five years 1932-36. The 1938 area reported by these countries was 56,225,000 acres, being 2.4 per cent below the acreage in 1937 and 1.3 per cent above the five-year average. The production of the leading countries, not including the United States, the Soviet Republics, and countries in the southern hemisphere, was reported as follows: Germany including Austria 205,875,000 bu., Turkey 118,716,000 bu., and Canada 102,731,000 bu. The Soviet Republics reported an average yield of 320,058,000 bu. for the four years 1932-35 and Argentina, the leading barley-growing country

south of the equator, an average yield of 30,381,000 bu. for the five years 1932-36.

The 1938 production of barley in the United States as estimated by the Department of Agriculture was 252,139,000 bu., which was more than 14 per cent above the 1937 production, 71 per cent above the very short crop of 1936, and above 7 per cent larger than the average for the 10 years 1927-36. The harvested acreage of 10,513,000 acres in 1938 compared with 9,968,000 acres in 1937 and with 10,967,000 acres, the average for the 10 years. The average yield per acre, 24 bu., was 1.9 bu. above that of 1937 and 3 bu. more than the 10-year average. The 1938 production of the leading States reporting estimates was as follows: Minnesota 48,020,000 bu., South Dakota 28,930,000 bu., California 27,550,000 bu., Wisconsin 24,286,000 bu., Nebraska 21,526,000 bu., and North Dakota 21,318,000 bu. Nebraska reported an acreage of 916,000 acres in 1938, an increase of over 40 per cent above the acreage in 1937.

In the fiscal year ended June 30, 1938, the United States exported 17,614,000 bu. of barley and 178,000 bu. of malt, and imported 1,290,000 bu. of grain and 170,444,000 lb. of malt. The preceding fiscal year the exports were 5,153,000 bu. of grain and 128,000 bu. of malt and the imports 17,151,000 bu. of grain and 434,074,000 lb. of malt.

BARNARD, bār'nērd, GEORGE GREY. An American sculptor, died in New York, Apr. 24, 1938. Born in Bellefonte, Pa., May 24, 1863, his early life was spent at Muscatine, Ia. Apprenticed to a jeweler, in 1882 he went to Chicago where he studied at the Art Students' League, and subsequently at the École Nationale des Beaux Arts (1884-87), and the Atelier Cavalier. In 1894 he exhibited at the Champs de Mars Salon in Paris, and two years later he returned to New York, where he completed his bronze god "Pan." While professor of sculpture at the Art Students' League, New York (1900-04), he was invited to do the sculptural work for the Harrisburg, Pa., Capitol Building, consisting of two groups of 31 statues, one entitled "Broken Laws" and the other, "The Laws We Keep." Until 1911 he was busy on this project.

After 1910, Barnard settled in New York where he established his studio in "The Cloisters." Here was his collection of Gothic art numbering about 600 pieces. This property and the Cloisters were subsequently given to the City of New York through the generosity of John D. Rockefeller, Jr., and were opened to the public on May 10, 1938. See ART MUSEUMS. In the spring of 1935, he held an exhibition of his work for the first time in 20 years, having during this period been engaged on "A Monument to Democracy," popularly known as "Rainbow Arch." This was 100 ft. high and 60 ft. wide and included 400 incidental figures, and it was Mr. Barnard's hope that it would eventually find a permanent location as a national monument. At the time of his death he was working on a heroic statue of Abel realizing the treachery of Cain.

His best known works included "Pan" on the campus of Columbia University; a bronze statue of Abraham Lincoln (1917) in Manchester, England; "The Urn of Life" in the Carnegie Museum; "Maidenhood" in the cemetery at Muscatine, Ia.; "Hewer" in bronze at Cairo, Ill.; "Cupid and Venus" in Paris; "Maidenhood" in the collection of Blair Thaw; "Hewer," "Rising Woman," and "Adam and Eve" on the Pocantico Hills estate of John D. Rockefeller; 50 pieces at the Barnard Museum, Madison, Ind., and 200 at the Museum

in Swarthmore, Pa. Also, his Lincolnia including a bust for the French government, a marble shrine showing bust at Redlands, Calif., and the bust in the Metropolitan Museum of Art, New York. He received a gold medal at the Paris Exposition (1900), at the Buffalo Exposition (1901), and a special gold medal of the National Association of Sculptors, Painters, and Artists of France. Mr. Barnard held membership in the American Academy of Arts and Letters and in the National Institute of Arts and Letters.

BARRETT, JOHN. An American diplomat, died at Bellows Falls, Vt., Oct. 17, 1938. Born at Grafton, Vt., Nov. 28, 1866, he was educated at Worcester Academy (1884) and attended Vanderbilt University (1888) and Dartmouth College (A.B., 1889; hon. A.M., 1899). After graduation he entered journalism and was a member of the editorial staff of various newspapers on the West coast and did considerable traveling throughout the world until he became associated with the diplomatic service, being appointed American minister to Siam in 1894. During his tenure there, which lasted until 1898, he was instrumental in settling by arbitration the Cheek case, involving American claims of several million dollars.

With the outbreak of the Spanish-American War, Barrett resigned his diplomatic post to become a correspondent in Cuba and also to act as special diplomatic adviser to Admiral Dewey (1898-99). Thereafter, he was commercial commissioner in China, Japan, the Philippine Islands, Korea, Siberia, India, Australia, and Europe; American delegate to the second Pan American Conference held in Mexico (1901-02); and commissioner general to Asia, Australia, and Europe for the St. Louis Exposition, 1902-03.

Appointed American minister to the Argentine in 1903, in 1904 he was transferred to Panama, where he adjusted the complex relations of Panama-Colombia-United States-Canal Zone. He served as minister to Colombia in 1905-06 and negotiated the first protocol for settlement of the United States-Colombia disputes over the Panama Canal.

Upon the reorganization of the International Bureau of American Republics on Jan. 1, 1907, Barrett was elected director general. Realizing the possibilities of such an organization, he worked zealously for its enlargement and for the erection of its own building. On Apr. 26, 1910, the new building was dedicated, and at the 4th Conference in Buenos Aires in that year, the name of the Bureau was changed, at the suggestion of Mr. Barrett, to the Pan American Union. He held office until Sept. 1, 1920.

In 1912 he founded the Pan American Society of the United States; was a delegate of the United States and secretary general of the Pan American Scientific Congress (1916); organized and was president of the first Pan American Commercial Conference (1911) and also of the second (1919); president of the Pan American Advisory Association (1919-20); and member of the General Committee on the Limitation of Armaments (1921-22). Later he became chairman of the International Pan American Conference and was its adviser and arbitrator in domestic and international economic matters.

Recipient of honorary degrees and decorated by the Venezuelan and Chinese governments in recognition of his services, he wrote, besides numerous articles on Latin American affairs, *Admiral George Dewey* (1899); *Pan American Union—*

Peace, Friendship, Commerce (1911); *Panama Canal, What It Is, What It Means* (1913); *Pan American Commerce—Past, Present, Future* (1919); *Pan America and Pan Americanism* (1922), and *The Call of South America* (1924).

BASKETBALL. See SPORTS.

BASQUE PROVINCES. The north central Spanish provinces of Alava, Guipúzcoa, and Vizcaya (Biscay). Total area, 2739 square miles; population, 947,559 (Dec. 31, 1934, estimate). The province of Navarra, which has a large Basque population, is not a part of the Basque Provinces. See SPAIN under *History*.

BASUTOLAND, ba-sōō'to-land'. A British native territory in South Africa. Area, 11,716 square miles; population (1936 census), 562,311, and 101,273 absentees as against 498,781 and 47,141 absentees (1921 census). The capital, Maseru, had 2319 inhabitants in 1921. In 1937 there were 77,616 pupils enrolled in schools of all kinds.

Production and Trade. Maize, wheat, sorghum, peas, barley, and beans are the main grain crops. Wool and mohair are important products. Livestock in the territory in 1937: 1,695,325 sheep and goats, 418,921 cattle, 85,017 horses, 22,766 donkeys, and 1068 mules. In 1937 imports were valued at £760,736; exports, £368,629, of which wheat and wheat meal accounted for £132,386; wool, £142,899; mohair, £57,615.

Government. For 1936-37 revenue amounted to £369,000; expenditure, £328,003. The territory is administered by a resident commissioner under the direction of the British High Commissioner for Basutoland, the Bechuanaland Protectorate, and Swaziland. In 1938 Basutoland was one of the signatories of a commercial treaty between Mozambique on one side and the High Commission Territories on the other. With certain exceptions, the treaty made provisions for reciprocal most-favored nation treatment. Resident Commissioner, E. C. Richards (appointed, March, 1935). See SOUTH AFRICA, UNION OF, under *History*.

BATES COLLEGE. A nonsectarian college for men and women at Lewiston, Me., founded in 1864. The enrollment for the autumn term of 1938 was 698. In the 1938 summer session there were 190 students. The faculty numbered 48. The endowment amounted to \$1,846,784. Total income was \$298,139, of which \$126,957 was from interest on investments, \$157,935 from student fees, and \$13,246 from gifts. The library contained 71,000 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

BATTLESHIPS. See NAVAL PROGRESS.

BAVARIA. See GERMANY.

BEAUX-ARTS INSTITUTE OF DESIGN. A school of fine arts in New York City, planned after the École des Beaux-Arts in Paris and organized in 1916 by the Society of Beaux-Arts Architects. The enrollment during the year 1937-38 consisted of 800 architectural students and 68 students of mural painting. Due to a lack of support the Department of Sculpture has been temporarily discontinued, beginning with the school year 1935-36. Similarly the Department of Creative Design has been discontinued, beginning with the school year 1936-37. The most important prize is that given by the Society of Beaux-Arts Architects, which, amounting to \$3600, affords two and one-half years' study in architecture at the École des Beaux-Arts in Paris. In the Department of Archi-

ture during the year 1938-39 the following prizes will be offered: Robert Perry Rodgers Memorial Prize \$100, Illuminating Engineering Society Prizes totaling \$850, Emerson Prize \$50, Warren Prizes totaling \$75, House Beautiful Prizes totaling \$75, Architectural Forum Prizes totaling \$75, Spiering Prize \$50. The director for 1938-39 is John W. Cross; the secretary is Lewis G. Adams. Headquarters are at 304 East 44th St., New York City.

BECHUANALAND (bèch'oo-'a-na-länd' or bék'ú-) **PROTECTORATE**. A British territory in South Africa. Area, 275,000 square miles; population (1936), 262,756 including 1899 Europeans. Serowe, 28,987 inhabitants, Kanye, Molepolole, Mochudi, and Maun are the chief villages. In 1937 the 132 schools were attended by 14,466 students.

Production and Trade. Livestock raising and dairying are the main industries. The production of grain crops is dependent on the rainfall. Livestock census (1936): 540,795 cattle, 410,694 sheep and goats. During 1937 the output of gold (17,577 oz.) was valued at £122,184; silver (1499 oz.), £89. By agreement, customs duties are collected by the Union of South Africa and paid into the Union Treasury from which a proportional payment is made each quarter to Bechuanaland. In 1937 imports were valued at £341,536; exports, £243,187.

Government. For 1936-37 revenue amounted to £228,810; expenditure, £253,534; 1937-38: revenue, £179,124, grants-in-aid, £94,512; expenditure, £263,463. The protectorate is administered by a resident commissioner (with headquarters at Mafeking, Cape Province) subject to the British High Commissioner for Basutoland, the Bechuanaland Protectorate, and Swaziland. Resident Commissioner, Capt. C. N. Arden Clarke.

History. It was announced during July, 1938, that a commercial treaty (providing for reciprocal most-favored-nation treatment with certain exceptions) between Bechuanaland, Swaziland, and Basutoland on the one side and Mozambique on the other had been signed in Lisbon. See **SOUTH AFRICA** under *History*.

BÉDIER, bâ'dyâ', (CHARLES MARIE) JOSEPH. A French Academician and scholar, died at Grand Serre, Drôme, France, Aug. 30, 1938. Born in Paris, Jan. 28, 1864, he was educated at the Lycée de Saint-Denis, the Lycée Louis le grand, and at the École normale supérieure, from which he graduated in 1886 and received the degree of doctor of letters in 1893.

His first position in teaching was at the University of Fribourg in Switzerland (1889-91), and then at Caen, France (1891-93), and at the École normale supérieure, Paris (1893-1903). He succeeded Gaston Paris as professor of medieval French languages and literatures at the Collège de France in 1903, retiring as such in 1936. Also, from 1929 to 1936 he was administrator of the Collège.

As a scholar, Bédier united minute scientific accuracy with sure literary insight as was shown in the introduction to his edition of the *Lai de l'Ombre* (1890), *Les Fabliaux* (1893), which received the Marcellin Guérin prize in 1894, and *Les Légendes Épiques* (2 vols., 1908-13). In the *Lai de l'Ombre*, he opposed the German mechanical method of text constitution. The *Légendes Épiques* was a monumental work in which he refuted the old theory of the origin of epic poems. His *Tristan et Iseult* (1900) was an adaptation of the ancient story, based on all the extant medieval versions in every language, and his *Chansons de Roland* (1922), with a commentary and glossary (1927), was a diminutive edition of the oldest French master-

piece. The collating of these numerous texts was done with painstaking care.

During the World War he was an active propagandist and his writings, including an edition of the diaries of German soldiers, published early in the War, were widely circulated in translations in the countries of the Allies. These works were *Les Crimes allemands, d'après des témoignages allemands* (1915); *Comment l'Allemagne essaie de justifier ses crimes* (1915), and *L'Effort français* (1919).

In 1920 he was elected to the French Academy to succeed Edmond Rostand, and in the following year he founded the *Revue de France*. As a member of the Academy he was one of a committee of three selected to work on the preparation of a new French grammar.

Professor Bédier was no stranger to the United States, having been visiting professor at Harvard (1909); lecturer at the opening of Columbia University summer session (1923), and lecturer in medieval history at the University of California (1927). In 1936 he lectured in America on French poetry.

Besides honorary degrees from Oxford, Harvard, and Louvain Universities, he held the Grand Cross of the French Legion of Honor. His works not mentioned above included *De Nicolao Musco* (1893); *Le Roman de Tristan*, poem of the 16th century by Thomas, published by the Society of Ancient French Texts (1902); *Études critiques* (1903); *Bibliographie des travaux de Gaston Paris*, in collaboration with Mario Roques (1904); and *La Châtelaine de Vergy* (1927). Besides numerous literary reviews, he wrote, in collaboration, *Histoire de la littérature française illustrée* (2 vols., 1923-24) and part of the *Histoire de la nation française*, edited by Gabriel Hanotaux (15 vols., 1920-24). See **PHILOLOGY**, **MODERN**.

BELGIAN CONGO. See **CONGO**, **BELGIAN**.

BELGIUM. A kingdom of Western Europe. Capital, Brussels (Bruxelles or Brussel). Sovereign in 1938, Leopold III, who succeeded to the throne Feb. 23, 1934.

Area and Population. Belgium has an area of 11,775 square miles and a population estimated on Dec. 31, 1937, at 8,361,000 (8,092,004 at the 1930 census). Births in 1937 numbered 126,343 (15.1 per 1000 inhabitants); deaths, 105,918 (12.7 per 1000); marriages, 63,301 (7.6 per 1000). In 1936 there were 13,510 emigrants and 17,655 immigrants. Estimated populations of the chief cities on Dec. 31, 1936, were: Brussels and suburbs, 905,312; Antwerp (Anvers), 272,688; Ghent (Gand), 163,765; Liège, 161,707; Mechlin (Malines), 62,246. The majority of the people are Roman Catholics, but no census figures are taken of religions.

Education. French and Flemish are both spoken and taught in the schools. Besides numerous private or free schools, mostly under church auspices, there were on Dec. 31, 1936, 8088 infant schools with 259,520 pupils; 8614 primary schools, with 964,802 pupils; 649 adult schools, with 18,691 pupils; 252 secondary schools of all kinds, with 79,203 pupils; 88 normal schools, with 12,812 students; and four universities (Brussels, Louvain, Ghent, and Liège), with 10,334 students.

Production. One of the most densely populated countries of Europe, Belgium is supported mainly by manufacturing, mining, agriculture, and commerce. Production of the chief crops in 1938, with 1937 figures in parentheses, was (in metric tons): Wheat, 484,300 (423,200); barley, 80,500 (85,500);

rye, 392,100 (345,000); oats, 543,400 (520,200). The 1937 yield of potatoes was 309,080 metric tons; beet sugar (1937-38), 219,100 metric tons; tobacco, 5700 metric tons; linseed, 13,700 metric tons; flax fiber, 23,800 metric tons. Livestock on Jan. 1, 1937, included 1,782,840 cattle, 1,054,475 swine, and 263,104 horses.

Mineral and metallurgical production in 1937 was (in metric tons): Coal, 29,681,000; pig iron and ferro-alloys, 3,843,000; steel ingots and castings, 3,869,000; black copper (1936), 58,800 (smelter); merchantable lead, 93,800 (smelter); zinc, 219,700 (smelter); cadmium (1936), 289. Leading manufactures include window and plate glass, paper, and cardboard (235,000 metric tons in 1937); cement (2,350,000 metric tons in 1936), cotton yarn, rayon (7800 metric tons in 1937), conditioned wool, other textiles, refined sugar, metal articles, brewery products, furniture and other wood products.

Foreign Trade. Merchandise imports in 1937 were valued at 27,256,817,000 Belgian francs (21,299,320,000 francs in 1936) and exports were 25,393,855,000 francs (19,525,544,000 in 1936). Of the 1937 imports, France supplied 3,449,962,000 francs; Germany, 3,119,870,000 francs; United States, 2,385,834,000 francs; United Kingdom, 2,304,378,000 francs; Netherlands, 2,266,472,000 francs. Exports were distributed mainly as follows: To France, 4,420,768,000 francs; United Kingdom, 3,492,698,000 francs; Netherlands, 2,831,562,000 francs; Germany, 2,810,048,000 francs; United States, 1,940,153,000 francs.

Finance. Budget estimates for 1938 placed ordinary revenues at 11,392,000,000 francs and expenditures at 11,318,000,000 francs. Extraordinary revenues were estimated at 22,100,000 francs and expenditures at 2,523,000,000 francs. The public debt on Dec. 31, 1937, was 55,762,000,000 francs (internal, 36,356,000,000; external, 19,406,000,000). Service of the debt in 1938 required 2,227,000,000 francs. The unit of currency for all foreign exchange transactions is the belga, equal to five paper francs. The exchange value of the belga was \$0.1877 in 1937 and \$0.1892 in 1938.

Transportation, etc. In 1926 the state placed the operation of its railways in the hands of a private company for 75 years. At the beginning of 1937, 3013 miles of line were operated by this company (Société Nationale des Chemins de Fer Belges) and 179 miles by four other companies. There were, in addition, 3243 miles of provincial railway lines. Heavy freight carried on the railways in 1937 amounted to 6,336,000,000 ton-kilometers (5,331,000,000 in 1936). The highway mileage in 1937 was 20,244, of which about 6500 miles were state roads. Automobiles numbered 201,700. About one-fourth of the total merchandise traffic inside Belgium is handled by the navigable rivers and canals (1030 miles in 1935). Commercial aviation is entrusted to one company, Sabena, which operates services connecting Brussels with London, Amsterdam, Basle, Cologne, Hamburg, Munich, Malmö, Prague and Elizabethville in the Belgian Congo (q.v.). The European operations of the company in 1937 were: Passenger-miles, 6,623,000; freight ton-miles, 100,700; mail in ton-miles, 23,439. The tonnage of the merchant marine on June 30, 1938, was 430,600 (420,400 on June 30, 1937).

Government. Executive power is exercised by the King through a ministry responsible to Parliament. There is a Senate of 167 members and a Chamber of Deputies of 202 members, all elected for four years. Deputies are elected directly by

universal male and restricted female suffrage. Of the Senators, part are elected by direct suffrage and part are chosen indirectly by the provincial councils. Premier at the beginning of 1938, Paul Emile Janson (Liberal), heading a National Union Government composed of the Catholic, Socialist, and Liberal parties. For the standing of the parties after the 1936 elections, see 1937 YEAR BOOK, p. 84.

HISTORY

Political Developments. The government formed by Paul Emile Janson (Liberal) on Nov. 24, 1937, representing a coalition of the Catholic, Socialist, and Liberal parties, resigned on May 13, 1938, as a result of dissensions over financial measures. It was succeeded two days later by another Catholic-Socialist-Liberal coalition ministry headed by 39-year-old Paul Henri Spaak, a moderate Socialist who was Minister of Foreign Affairs in the Janson Cabinet. The Spaak Cabinet, reduced from 15 to 11 Ministers, included four Socialists, four Catholics, two Liberals, and a non-party general, Defense Minister Henri Denis. The key Finance post was given to Max Leo Gerard, a Liberal economist and able financier. M. Spaak retained the Foreign Affairs portfolio and the other key post, that of Minister of Economics and Agriculture, went to H. C. J. Heyman (Catholic), a banker and engineer.

The resignation of the Janson Government was the climax of a financial and budgetary crisis that began to develop early in the year. The Socialists, comprising the largest party in the Chamber of Deputies, demanded the immediate enactment of the costly social legislation promised them in 1937 in return for their participation in the government. Meanwhile the marked recession in business activity had forced the budget more out of balance, leading the Catholic and Liberal members of the government to insist on the postponement of social reforms until conditions improved. The heated character of the financial debate led to a riot between Socialist and Rexist (Fascist) Deputies in the Chamber late in January.

The resignation of Finance Minister Henri de Man on March 9 was taken as a warning of impending financial difficulties. His duties were taken over temporarily by Joseph Merlot, the Minister of Public Works. The devaluation of the French franc on May 5 erected a formidable barrier between Belgian exports and their chief market, caused an outflow of gold and Belgian capital, and brought the political conflict within the government coalition to a head.

Faced with the alternatives of either again devaluing the belga or of returning to the deflationary policy abandoned by the Van Zeeland Government in 1936, Premier Janson decided on devaluation. On May 10 the National Bank raised the rediscount rate from 2 to 4 per cent and the government took other measures to check the depreciation of the belga. The Socialists insisted on riding out the crisis by increasing taxation enough to balance the budget, while the Catholics and Liberals, both middle-class parties, opposed further taxation and demanded cuts in social reforms and other governmental expenditures. When Rexist Deputies joined the Catholics in opposing the Socialist tax measures, Premier Janson gave up his task as hopeless and resigned.

The Spaak Government, formed in record time under King Leopold's threat to dissolve Parliament, won a 132-to-38 vote of confidence on May 18, following the new Premier's promise to balance

the budget, to continue social reforms, and to defend democracy through the reorganization of governmental institutions. M. Spaak said his main objective was to increase production. Under a compromise reached by the three government parties, the Socialists abandoned their long opposition to abolition of the "blue laws" restricting liquor sales to stores. On May 18 a bill was passed to permit liquor to be served in cafés and restaurants. This was expected to eliminate countless bootlegging establishments and increase government tax revenues. In return for this concession, the Catholics and Liberals voted for three tax measures, two of which increased existing taxes. The other re-established the national crisis tax, repealed during 1937, which imposed a special levy ranging from 1½ to 4 per cent on incomes. These measures were expected to produce an additional 800,000,000 francs in revenue during the remainder of the fiscal year.

Even these measures failed to wipe out the budget deficit entirely, but they sufficed to bolster the state's credit and check the depreciation of its currency and securities. On May 30 the National Bank lowered its discount rate to 3 per cent and in subsequent months much of the gold exported during the crisis was repatriated. Meanwhile the pre-devaluation policy of foreign borrowing was resumed with an initial loan of 700,000,000 francs from a Dutch syndicate. In November the National Bank again lowered the discount rate—to 2½ per cent. The improvement in the government's credit permitted the flotation of a billion-franc, 3½ per cent, long-term loan and a reduction in interest on short-term bills to 2.02 per cent. In December Parliament raised the betting tax from 5 to 15 per cent and a 15 per cent tax was imposed on football pools.

The considerable degree of success achieved by the Spaak Ministry in meeting the financial crisis was an important factor in the triumph of the traditional parties in the communal elections held throughout Belgium on October 17. The extremist parties—Communists, Flemish Nationalists, and Rexists—made a poor showing.

Premier Spaak's decision of November 29 to recognize the Franco regime in Spain and withdraw from the London Non-Intervention Committee on Spain angered a large section of the Socialist party and led them to renew their demands for the immediate enactment of the promised social legislation. The fall of the government on the latter issue was averted by the resignation of Finance Minister Gerard on December 2. On December 4 Premier Spaak named Albert Edouard Janssen (Catholic) as Finance Minister and enlarged his cabinet to include new Ministers of Agriculture, Foreign Trade, and Unemployment. On December 5 the Socialists, with five places in the cabinet, voted to oppose the Premier's decision to exchange agents with Insurgent Spain. The issue was brought before the Chamber the next day and Spaak was upheld, 111 to 49, after a violent debate. The Premier continued in office, but with most of his own party on record against him, his position was considered weak.

Foreign Relations. The rapid drift of Europe toward totalitarian economic systems and war presented a growing menace to Belgium's political security and economic livelihood. Its foreign policy throughout 1938 was directed toward checking this general trend while at the same time insulating Belgium insofar as possible against its terrifying consequences.

The program for world economic appeasement

drawn up by former Premier Paul van Zeeland at the request of the British and French Governments and made public on Jan. 28, 1938, was a major effort to reverse European and world economic and political trends. Declaring that the removal of obstacles to international trade was essential to peace and prosperity, Dr. Van Zeeland recommended that the principal economic powers establish an international bureau for the study of economic grievances and launch an immediate program for the restoration of trade through the gradual removal of exchange restrictions and trade quotas, the reduction of tariffs, the adjustment of foreign debts, and the extension of credits to countries which would otherwise be forced to retain their trade and exchange restrictions.

The failure of the Van Zeeland Report to change European trends was demonstrated on May 11 when representatives of Belgium and the other Oslo Powers (Denmark, Finland, Netherlands, Norway, and Sweden) announced that economic conditions made it impossible to renew the convention signed at The Hague on May 28, 1937. (The signatories of this convention had agreed to a concerted reduction of trade barriers and elimination of "crisis" measures as a step toward improved economic relations.) The same governments took another step away from international collaboration at a meeting of their Foreign Ministers in Copenhagen on July 23-24. There they adopted a resolution declaring that the Covenant of the League of Nations did not require any member to apply sanctions against an aggressor. This tended to confirm Belgium's policy, adopted in 1936, of unconditional neutrality in any conflict among the great powers.

A near test of the effectiveness of this policy was presented by the European crisis produced in September by German demands on Czecho-Slovakia (q.v.). The Belgian Government took energetic measures to defend its neutrality in case France and Germany became involved in war. On September 5 the cabinet recalled King Leopold from Italy, where he was spending a vacation. All frontier fortresses were manned and defense preparations were rushed, particularly in the districts of Eupen and Malmedy, ceded to Belgium from Germany by the Versailles Treaty. As the crisis deepened a food dictator was appointed, art works were moved to places of safety, and children were evacuated from the frontier regions. On September 27 partial mobilization orders called 270,000 Belgians to the colors. Strategic bridges and highways along the French and German frontiers were mined and every precaution was taken against invasion from either side. Demobilization of the troops started at the beginning of October with the passing of the crisis.

The seriousness of the threat to Belgium and to Europe led King Leopold to renew his efforts toward economic appeasement. In the middle of October, while dedicating a monument in Paris to the memory of his father, he made an impassioned plea for peace through the elimination of economic strife between nations. However, the suggestion that Belgium might join in appeasing Germany by ceding all or part of the Belgian Congo was indignantly rejected by Premier Spaak in the Chamber of Deputies on November 3. King Leopold and Premier Spaak paid a state visit to the capital of the Netherlands beginning November 21 to discuss regulation of the Scheldt River, the Albert Canal, and other waterways and to arrange for joint action in dealing with the problem of Jewish refugees from Germany. On November 18 Premier

Spaak had announced that refugees from the Reich would not be turned back as had been the practice in preceding months, and that Belgium would co-operate with other democratic countries in seeking a permanent asylum for German Jews.

See DENMARK under *History*.

BELORUSSIAN SOVIET SOCIALIST REPUBLIC. See WHITE RUSSIAN SOVIET SOCIALIST REPUBLIC.

BENEFACCTIONS. Bequests and gifts for philanthropic purposes during 1938 were less than in 1937; there was a noticeable falling off of bequests for relief. Among the large public benefactions made in 1938 may be mentioned those from the estates of George D. Pratt, son of Charles M. Pratt, founder of Pratt Institute, Brooklyn, N. Y., and Charles M. Pratt, founder of Pratt Institute. Benefactions through the year of sums or property to the value of \$500,000 or more, made chiefly by persons who died during the year or in recent years, follow:

Henry W. Putnam, of Bennington, Vt., bequests totaling \$500,000 to 12 charitable institutions, mostly in New York City. Mr. Putnam's residuary estate of undetermined value will eventually be shared by Harvard, Yale, and Princeton Universities.

George D. Pratt, of Glen Cove, L. I., bequests totaling \$510,000 to Pratt Institute, Metropolitan Museum of Art, Trustees of Amherst College, Brooklyn Young Men's Christian Association, Brooklyn Bureau of Charities, and Brooklyn Society for the Prevention of Cruelty to Children.

Charles M. Pratt, of Glen Cove, L. I., bequests of over \$150,000 to various educational and religious institutions. Frederick W. Vanderbilt, of N. Y. City, bequests to Sheffield School, Yale University, Vanderbilt University, Salvation Army, and New York Association for Improving the Condition of the Poor.

Daniel J. Tompkins, of Brooklyn, N. Y., a gift of \$598,219 to Cornell University, and smaller gifts to five public institutions.

Mary Colgate, of Yonkers, N. Y., bequests of \$100,000 to Warburton Ave. Baptist Church of Yonkers, \$250,000 to Eastern Baptist Theological Seminary, Phila., Pa., and large sums to other religious organizations.

Ogden L. Mills, of N. Y. City, bequests totaling \$550,000 to Harvard University, Metropolitan Museum of Art, N. Y. City, Home of Incurables, N. Y. City, Charity Organization Society, N. Y. City, and National Cathedral, Washington, D. C.

Elhu Root, of N. Y. City, gift of \$200,000 to trustees of Hamilton College, Clinton, N. Y., besides smaller gifts to churches and charitable organizations.

C. R. Hooker, of New Haven, Conn., bequests to charity of large sums of his \$1,000,000 estate.

Dr. Daniel E. Martell, of N. Y. City, in his will set up his residuary estate valued at upward of \$400,000 "to establish a trust the income from which is to be devoted to the furtherance of the art of music in the United States and more particularly in the City of New York."

Harry Kraus, of N. Y. City, bequests of more than \$250,000 which will eventually go to religious and philanthropic institutions.

Phelps Smith, of Malone, N. Y., an estimated \$2,500,000 estate to be used for establishing of a northern New York college.

A. E. Macy, of N. Y. City, bequests of \$500,000 to Teachers College, Columbia University, and \$100,000 each to Henry Street Settlement, and the Metropolitan Museum of Art.

G. L. Ford, of N. Y. City, bequests to 10 institutions of \$89,561 each.

A. H. Lea, of Phila., large bequests to Harvard, Pennsylvania, and Princeton Universities.

Mrs. E. I. Kane, of New Rochelle, N. Y., bequests of more than \$370,000 to be divided among several hospitals and charitable institutions. The largest amount was to the Sisters of Charity of St. Vincent de Paul, of Mount St. Vincent-on-Hudson, N. Y.

Henry Dazian, of New York, left \$1,325,288 for the creation of the Dazian Foundation for Medical Research.

See AGRICULTURAL EXPERIMENT STATIONS; ART MUSEUMS; GENERAL EDUCATION BOARD; LIBRARY PROGRESS; PRINTS; ROCKEFELLER FOUNDATION; UNIVERSITIES AND COLLEGES.

BEREA COLLEGE. A nonsectarian coeducational institution in Berea, Ky., founded in 1855 and designed to serve the educational needs of the

mountain people of the Southern Appalachian region. The enrollment for the autumn of 1938 was 1809, distributed as follows: College of arts and sciences, 812; secondary school and below, 954; nurses, 43. The enrollment in the summer session of 1938 was 269. The faculty numbered 118. The endowment amounted to \$10,158,395.78 and the income for the year ending June 15, 1938, was \$539,882.13. The library contained about 81,000 volumes. President, William J. Hutchins, D.D., LL.D.

BERMUDA. A British colony in the North Atlantic, 677 miles southeast of New York. It comprises 360 small islands of which 20 are inhabited. Area, 19.3 square miles; population (1937 estimate), 30,951 (12,143 whites; 18,808 Negroes), compared with 27,789 (1931 census). Chief towns: Hamilton (capital), 3259 inhabitants in 1931; St. George. In 1937 there were 728 living births and 329 deaths. The average school registration for 1937 totaled 4587. Bermuda is an important British naval base.

Production and Trade. The chief products are onions, potatoes, lily bulbs, cut flowers, and green vegetables. Bananas and arrowroot are also grown. During 1937, 71,959 bu. of vegetables, valued at £24,300, were exported. For the year 1937 a total of 83,092 tourists visited Bermuda. There were 101 miles of roads. In 1937 imports were valued at £2,183,152; exports, £179,735.

Government. For 1937 revenue totaled £476,678; expenditure, £450,754; public debt, £75,000; sinking fund, £48,569. Revenue for 1938 was estimated at £427,017; expenditure, £466,685. The colony is administered by a governor, aided by an executive council of 7, a legislative council of 9, and an elected house of assembly of 36 members. Governor and Commander-in-Chief, Lt.-Gen. Sir Reginald John Thoroton Hildyard (assumed office, May 21, 1936).

History. On Jan. 31, 1938, Bermuda was represented at the Inter-Colonial Customs Conference held in Jamaica to discuss uniform customs procedure. On March 16 an air-mail service was inaugurated from Baltimore to Bermuda by the *Bermuda Clipper*, supplementing the air-mail service from Bermuda to New York. On December 1 ships in regular service to Bermuda were restricted in the practice of keeping passengers on board while in port.

BESSARABIA. A territory joined to Rumania on Apr. 11, 1918, formerly a province of Russia. Area, 17,146 square miles; population (Jan. 1, 1937, estimate), 3,092,949.

BIBLE SOCIETY, AMERICAN. Organized in 1816, this society has steadily carried forward its specific purpose of "circulating the Holy Scriptures without note or comment" and without discrimination as to class, color, or creed. Bibles, Testaments, and Portions are sold without profit and below cost or donated free when circumstances justify. During the 122 years of its existence, the society has issued 283,700,204 volumes and participated in the translation, publication, and distribution of the Scriptures in nearly 300 languages, dialects, and versions.

The work in the United States is carried on through 11 home agencies and some 100 auxiliary, State, and local Bible societies. Latin America and the Near East and Far East are covered by 12 additional agencies, while correspondents help carry on the work in other countries, especially in Europe and Africa. During 1937 the society issued 7,328,550 volumes in 170 languages, including 4,724 volumes for the Blind. The number issued in the

United States was 3,338,743, and in foreign lands, 3,989,807. Engaged in this distribution were 3064 agency secretaries, sub-agents, colporteurs, correspondents, and volunteers.

The budget of the society for 1938 was \$971,508. The officers were John T. Manson, president; the Rev. Eric M. North, D.D., and the Rev. George William Brown, D.D., general secretaries; the Rev. Francis Carr Stifter, D.D., recording and editorial secretary; Mr. Rome A. Betts, associate secretary, Rev. James Oscar Boyd, assistant secretary, and Gilbert Darlington, treasurer. Headquarters of the society are in the Bible House, Park Avenue & 57th Street, New York City.

BIOLOGICAL CHEMISTRY. The reading of the papers in the field of biological chemistry during the last year shows that this field of investigation continues to expand, and that many important developments have been reported. Some of the most interesting researches have been concerned with the vitamins. The structure of another fat soluble vitamin, vitamin E (α -tocopherol), has been established. It has also been synthesized. This anti-sterility factor, first discovered by Evans, has been shown by Fernholz to be a 6-hydroxy chromane derivative having a side chain of 16 carbon atoms attached to position two of the chromane ring. It is not an ether of durohydroquinone, as Fernholz first suggested last year, but the structure now proposed explains the formation of durohydroquinone during pyrolysis of the vitamin. Other investigators, notably John, Karrer, Bergel and Todd, and Evans and co-workers have submitted experimental evidence which corroborates this structure. Three syntheses of this vitamin have been reported (1) by Smith and co-workers, (2) by Bergel and Todd, and (3) by Karrer et al. The latter prepared the racemic vitamin by condensing trimethyl hydroquinone with phytol bromide. The optically inactive α -tocopherol, thus produced, was resolved into its optically active form by fractional crystallization of its bromocamphor sulphonate. The physiological activity of this synthetic product is the same as that of the natural vitamin.

Other experiments in this field have been reported which are of interest. Vitamin E has been found to produce growth in test animals. There also seems to be no definite relationship between constitution and physiological activity in the case of this vitamin, for John and von Werder have prepared 23 ethers of durohydroquinone, and six ethers of pseudocumohydroquinone, and they report that all these compounds show partial vitamin E activity.

Many papers continue to be published on the physiological properties of vitamin B₁ (Thiamin). Lack of this vitamin has been shown by a group of biochemists at Oxford to produce an excess of pyruvic acid in the system. It will be recalled that this latter compound is responsible for polyneuritis in pigeons. This function of the vitamin can be regarded as of an enzymatic nature. In fact, some time ago Lohmann and Schuster reported the isolation of an enzymatic system from yeast which exhibited co-carboxylase activity. The source of this co-enzyme and its function suggested the relationship to thiamin, and Tauber showed that the reaction product of pyrophosphoric acid, and thiamin exhibits the same enzyme activity as the co-enzyme of Lohmann. Recently Wijlard and Tauber isolated this co-enzyme in a chemically pure form, and from its reactions and analysis it was shown to be the

pyrophosphoric acid ester of thiamin. Thus, at least one of the specific reactive forms of thiamin in the animal system has been made available by synthesis.

Other experimental facts concerning this vitamin have been reported. Thiamin seems indispensable for the growth of excised tomato plants when grown in synthetic nutrient solutions. It is reported that it cannot be replaced by lacto-flavine, cysteine hydrochloride, indole-3-acetic acid, inositol, etc. 4-Methyl-5- β -hydroxy-thiazole, a constituent of the thiamin molecule, can replace it at a concentration of 0.17 per cc. However, the other part of the molecule, 2-methyl-5-bromomethyl-6-amino pyrimidine fails to replace the vitamin entirely. This leads to the speculation that whereas the pyrimidine portion of the vitamin may be synthesized in the plant itself, the thiazole fragment must be supplied in a pre-formed state.

Thiamin also seems to be an important factor in the life and growth of micro-organisms. Bacteria can, however, utilize not only the vitamin itself, but also its derivatives and even some of its analogues. Some very interesting facts in connection with biotin have been reported. Biotin is a new growth substance for yeast, and was isolated by Kogl. It has a composition C₁₂H₁₈O₆N₂S and is found in yeast and in newly laid eggs. Its activity is very great, having been found to stimulate the growth of yeast at a concentration of $1-4 \times 10^{-11}$. It occurs in yeast, however, in very small quantities (360 tons of yeast yield one gram of biotin). Together with thiamin this substance produces some interesting results. It has been found that *polyporus adushis* does not grow in a synthetic medium unless thiamin is supplied. Neither will *nematosporea gossypii* grow in a synthetic medium without biotin. If, however, these two kinds of bacteria are placed in the same medium they grow. Hence it would appear that in this instance a case of artificial symbiosis has been realized. The *polyporus* liberates biotin necessary for the *nematosporea*, while the latter supply the required thiamin necessary for the growth of *polyporus adushis*.

The year has witnessed an increase in our knowledge of vitamin B₆, the anti-dermatitis component of the vitamin B complex. It has been isolated in three different laboratories: (1) by Keresztesy and Stevens; (2) by Kuhn and Wendt; (3) by P. Gyorgi and Lepkowsky. Kuhn and Wendt obtained it from yeast, and showed that it was a protein compound with a prosthetic group attached to the protein residue in much the same manner as riboflavin is attached to the proteinic group to form vitamin B₂. The prosthetic group can be freed from the protein by heating. The substance, thus obtained, gives a hydrochloride which melts at 204-205° and has a composition C₈H₁₁NO₃.HCl. It has three hydroxyl groups, two of them being alcoholic, and one being phenolic. The nitrogen in the molecule appears to be in a ring, and is tertiary. The curative dose is 107. According to Gyorgi, for complete action it appears to need the "filtrate factor." Birch regards this "filtrate factor" as a fat-soluble substance while vitamin B₆ is water soluble. It is also known that this factor is contained in the fatty acid fraction of maize oil. Its function, therefore, may consist in the utilization of unsaturated fatty acids in the body.

The discovery of two new vitamins, L₁ and α_2 , by Nakahara, Inukai, and Uganui, has been reported. The former was found in bakers' yeast; the latter was isolated from beef liver. According to the discoverers both vitamins are essential to rats for the production of milk for their young. It is not clear,

however, whether the vitamin in beef liver is different from the one present in a "lactation factor" discovered by Mapson several years ago.

The importance of nicotinic acid has been greatly increased by the discovery of some new and important physiological properties which it possesses. Both this substance and its amide have been found to prevent pellagra in humans, and black tongue in dogs. Elvehjem and his co-workers isolated the vitamin, and showed that it is identical to nicotinic acid amide. It is now believed that this acid and its amide are a part of Warburg's co-enzyme. Also of interest is the discovery that both nicotinic acid and its amide are essential for the growth of certain staphylococci, diphtheria, and dysentery bacilli. This property is also shared by other substances more or less related to nicotinic acid. Changes of the molecule due to esterification or other modifications of the carboxyl group do not seem to affect its activity. Thus, methyl nicotinate, ethyl nicotinoacetate, N-methyl nicotinic acid amide, and nicotinonitrile are capable of supporting the growth of the above mentioned bacilli. On the other hand pyridine-2-sulphonic acid, 6-methyl nicotinic acid, and isonicotinic acid do not possess this interesting property.

Notable advances have been made during the year in the field of the hormones. Of special interest is prolactin, the hormone which regulates the flow of milk in mother animals. This compound, first isolated in a crystalline state by Dr. White of Yale University, is produced in the pituitary gland, and is of a protein nature. Injections of it in animals produce many startling effects, as, for example, gain in weight, enlargement of the liver, lengthening of the intestines, change in size of the sex organs, and development of the mother love instinct in virgin animals. It is also a powerful stimulating hormone and appears to have most pronounced effects on the whole endocrine system.

The existence of another hormone of the pituitary gland has also been reported by Newfield and Collip. This compound is found in the *pars intermedia*. It has ketogenic properties, and appears to possess anti-insulin activity. Other interesting observations have been made concerning the existence of anti-hormones. Apparently the production of these substances is not limited to the protein type of hormones, for it has been exhibited by hormones of simpler chemical nature. For instance, it is known that adrenalin produces fatal shock when administered in heavy doses. Swingle has observed that when a dog recovers from such shock induced by sublethal doses it builds up a resistance toward this hormone, and can withstand doses which are fatal to other dogs which did not receive previously such injections. It has also been noted that the cortical hormone can bring about this recovery from adrenalin shock.

The existence of other hormones which are of a protein nature has been noted. Zondeck and Sulman have described the existence and properties of an antagonodotropic factor in the blood which is produced by repeated injections of gonadotropic hormones. At present this factor has been obtained only as an acetone-dried powder. Apparently it is destroyed by heating at 80° for an hour. It is also inactivated by pepsin, trypsin, and by dilute alkali. It is stable, however, to ultra violet light and to a 1 per cent solution of hydrogen peroxide.

Laofburow has isolated a yellow crystalline material from yeast cells which have previously been injured by exposure to X-rays. He reports that it is a protein and that it possesses the property of

causing growth of both epithelial and of fibroblast cells. Already it has found application in the treatment of skin burns where it induces a rapid growth of epithelial cells. In this connection it may be of interest to note here that similar studies also have been made of other hormones. For example, anterior pituitary hormone and prolactin have been found to be active in checking the cell division process of sea-urchin eggs. Heparin, the anti blood clotting hormone, also retards cell growth at a concentration of 10^{-3} . It is to be noted, however, that although the development of the eggs was retarded they were not killed.

The existence of a pressor principle in the renal cortical tissue of kidney has been shown recently in Dr. Swingle's laboratory, Princeton University. This principle can be separated from the fresh saline extracts of the gland by precipitation with ammonium sulphate. It is not yet known whether it be a protein, but its chemical properties suggest this possibility. Since this substance causes hypertension it is of special interest because it is likely that its presence causes the hypertension of old age.

Exhaustive investigations of the steroid products in urine continue to be made. Marker and his co-workers have isolated a number of interesting compounds from stallions' urine and from mares' pregnancy urine. A new saturated alcohol, β -equistanol, has been isolated and the existence of its α -isomer has been demonstrated indirectly. The chemical structure of this molecule has been shown to be different from the natural sterols of the same molecular weight. From the ketonic fraction from mares' pregnancy urine these investigators have also isolated other compounds, notably pregnanedione, *allo*-pregnanedione, *allo*-pregnanol-3 β -one 20, and uranol-11-one 3. According to Marker the urane derivatives contain an hydroxyl group at C₁₁. This is, indeed, interesting in view of the possible biogenetic relationship with the cortical hormone, cortin, which to date is the only steroid hormone believed to possess this structural characteristic. Also of interest is uranediol, another hormone obtained from mares' pregnancy urine. This compound has the usual configuration at C₅ but possesses the unusual β -configuration at C₃, and is, thus, at the present writing the only compound in this series found in urine.

Work continues to be done on the cortical hormone. Although a number of substances possessing cortical activity have been isolated, it can be said that the amorphous substance obtained from the gland itself appears to have the maximum potency, and thus contains a compound whose chemical structure is not yet known. Some other observations on this material should also be recorded. It has been found that adrenalectomized dogs, which in the past could be kept alive only by supplying cortical extract, can maintain their lives if pure progesterone is administered in place of the cortical extract. Progesterone, it will be recalled, has a somewhat similar chemical structure, but it lacks an hydroxyl group at C₁₁, and does not have the

CH₂OH

terminal group, $\text{—}\overset{\text{O}}{\text{C}}\text{=}$, at C₁₇. It is known, however, from the properties of desoxycorticosterone that the hydroxyl group at C₁₁ is not essential for the activity. If the terminal side chain of corticosterone is essential, then it can be concluded that the side chain of progesterone is suitably modified by some enzyme system in the body. Investigations on this hormone also show that when properly administered it can produce a re-

fractory state in animals. Intravenous injections of the hormone of 20–40 cat units causes retention of sodium which lasts for six hours. When injections are repeated a refractory state is developed which continues for several weeks. It has also been demonstrated that a normal dog receiving an injection of the serum of the refractory dog develops a temporary refractory condition.

Important investigations on the activity of androgenic hormones have been published. From this work it is now clear that the activity can be increased by simultaneous administration of palmitic or stearic acid or of their sodium salts. The palmitic or stearic acid ester of testosterone, however, has been found to be almost inactive. Miescher and co-workers report that in the case of oestrone the duration of the oestrus period increases when palmitic acid or stearyl alcohol is administered with oestrone subcutaneously. The "threshold value" increases with the length of the acid chain to oestrone-n-octanoate. Then it decreases.

The year has witnessed great activity in the field of the phytohormones. From the many studies of different active substances which have been tested it appears that the property of cell elongation which a particular phytohormone possesses does not depend upon the nucleus, but rather it is a property of a particular molecular configuration. The minimum structural requirements appear to be: (1) at least one ring system in the nucleus; (2) presence of at least one double bond in the ring; (3) a side chain; (4) an active or a potentially active carboxyl group in the side chain, which is removed at least by one carbon atom from the nucleus; (5) when a side chain has a *cis* configuration to the nucleus the hormone is made active, a *trans* configuration makes it inactive.

Certain experimental results obtained from studies in the bile acids and on the sterols should be noted. Wallis and his co-workers at Princeton University have definitely established the structure of the isomeric ethers of cholesterol. They are configurationally related to a new isomer of cholesterol designated as *i*-cholesterol. This new sterol has a cyclopropane ring in ring A of the sterol molecule, and the hydroxyl group is located at the C₆ position.

From "metabolic balance" experiments it has been shown that in the mouse cholesterol can be synthesized from a diet free from this sterol. It cannot be definitely said, however, whether this holds true for other animals because unlike larger mammals mice have a very high metabolic rate. It has also been shown that sterols which are unabsorbable or only difficultly absorbable do not affect the biosynthesis of cholesterol. Administration of cholesterol itself, however, does affect it. Large amounts not only prevent the synthesis of this sterol, but actually bring about a destruction of the sterol molecule.

Hemolytic properties of bile acids and of sterols have been investigated. Those compounds whose hydroxyl groups at C₃ have a *cis* configuration to the methyl group at C₁₀ and have either a *trans* fusion of rings A and B or have a double bond between C₅–C₆ have been found to be antihemolytic, whereas the bile acids having the opposite configuration at C₃ and C₆ have hemolytic properties. To date no sterol has been observed which possesses hemolytic action. This fact may be ascribed to the low solubility of the sterols. It has also been observed that hemolytic activity can be modified by changing the hydroxyl group or other active groups

in bile acids, but such acids can not be made completely antihemolytic.

The field of the proteins, viruses, and enzymes continues to be exceedingly attractive to many investigators, and some of the most interesting researches have been concerned with these substances. A new theory of protein formation has been given by Dr. Max Bergmann of the Rockefeller Institute, New York City. According to him, proteins contain 288 units, or simple multiples of 288 units per molecule. Each kind of protein is synthesized by a specific enzyme; the simpler proteins then combine again under the influence of other specific enzymes to give more complex molecules, the chain stopping when no specific enzyme is available to continue the process. Enzyme synthesis of polypeptides has been accomplished, and apparently the first part of the theory has been substantiated. It is also to be mentioned that this theory has an important bearing on heredity, and will, therefore, be an important postulate for further investigations because, according to Bergmann, from generation to generation in the germ cells there is transmitted those specific enzymes capable of synthesizing proteins of a "predetermined sequence of specific reactions." Thus our hereditary characteristics are handed down from parent to child.

Some interesting facts have been observed in studies on enzymes. Herriot, Bartz, and Northrop have found that when swine pepsinogen is activated with chicken pepsin, the resulting enzyme is swine pepsin. Conversely, activation of chicken pepsinogen with swine pepsin yields chicken pepsin. Thus the structural characteristics which cause "species specificity" of the enzyme are present in the inactive enzyme precursor. Similar changes can be brought about with trypsinogen by an enzyme produced by a genus of *Penicillium*. This change takes place only in acid medium. The particular kinase which produces this change has a molecular weight of about 40,000 as determined by diffusion methods, and is destroyed either by heating at 70° or at a pH 6.5 or above.

Certain other facts in this field are of interest. Tauber has reported some new activators of the carboxylase system. Among others the action of sodium cyanide is of special interest. From its action it would appear that no heavy metal is associated with the catalytic activity of the enzyme. The cyanide activates the enzyme presumably by forming a more reactive "enol" compound, i.e. a cyanohydrin with the pyruvic acid. It is also observed that the carboxylase becomes very labile when it is separated from its co-enzyme, co-carboxylase.

Continued work on xanthine oxidase, which activates the purines and also "true" aldehydes, but not derivatives of the aldehydes, has shown that this material is identical to Schardingers' enzyme.

Hopkins and Morgan have found that when succinic dehydrogenase is incubated with a solution of cystine at pH 7.6, the enzyme loses its activity completely. When, after filtering and washing, the inactive material is incubated with cysteine, its activity is again restored. This interesting fact has been explained on the assumption that the first treatment involves the removal of the –SH groups by oxidation, and that during the second treatment a restoration of the –SH groups by reduction takes place. It has been noted that glycerophosphate dehydrogenase is not affected by similar treatment. It would, therefore, appear that for the activity of succinic dehydrogenase the existence of –SH groups in the molecule is indispensable.

Investigations continue on the problem of the

metabolism of fats and proteins. Schoenheimer is continuing his studies using the nitrogen isotope N^{15} . The carbon isotope is being made available by Urey. With it we may expect in the near future that many important problems in this field will be studied. Metabolic studies with radioactive substances as tracers are in progress. Using radioactive iron it has been shown that in the body the iron first enters the blood plasma. It then enters the blood cells. In six hours this absorption can be noticed. Other interesting facts have been observed with radioactive phosphorus. Leukemia cells concentrate in the bones, liver, and spleen. When radioactive phosphorus is administered to the animal these cells exchange their phosphorus for the radioactive modification in a much higher percentage than do the normal cells. Thus, the radioactive phosphorus is concentrated in these organs.

Among the important results obtained in the field of the viruses recent work at the Rockefeller Institute, Plainsboro, N. J., is of special interest to this reviewer. It has been shown that one of the constituent parts of the tobacco mosaic virus molecule is nucleic acid. This nucleic acid is similar to yeast nucleic acid and not to thymus nucleic acid. Since the structure of this form of nucleic acid is known the structure of a fragment of the virus molecule can be said to have been determined.

Advances continue to be made in chemo-therapy. The outstanding example is the discovery that pyridine sulfanilamide is effective in the treatment of type B pneumonia. This reviewer reported last year that sulfanilamide itself was effective in the treatment of a variety of bacterial infections and in certain types of pneumonia, but it has no effect on type B pneumococcus. Many other compounds of this nature have been prepared and studied, but the pyridine derivative is by far the most effective for this particular bacterial disease.

Research in the field of the carbohydrates progresses slowly, effort for the most part being concentrated on the polysaccharides, cellulose, starch, glycogen, insulin, varianose, etc. In the field of the simple sugars, mention may be made of a new method for the preparation of glycofuranosides developed recently by Pacsu and Green. If one allows the ethyl mercaptal of the sugar to react with mercuric chloride in a neutral solution of the chosen alcohol crystalline glycofuranosides can be obtained. By this means α -ethyl-*l*-rhamnofuranoside, β -methyl, β -propyl, and β -benzyl galactofuranosides, and α -methyl and α -ethyl-*l*-arabinofuranosides have been prepared, and it has been found that these new compounds have rotations which agree well with values calculated from Hudson's rules of isorotation.

Increasing interest is being shown in studies on the role of metals in the animal organism. It can now be stated with some degree of certainty that magnesium deficiency can be divided into two phases. The first phase produces vasodilation, hyperemia, and hyperexcitability; malnutrition, calchesia, and damage to the kidneys appear in the second phase. Administration of increased amounts of calcium increases the severity of magnesium deficiency. Similar conditions have also been observed in plants when magnesium compounds are withheld. Sugar beets develop yellowish white leaves, and the seedlings live only about two months. The percentage of sugar in the leaves also decreases. In the case of peach trees, lack of each of the following elements, K, Ca, Mg, P, N, S, Fe, Mn, and B, produce characteristic symptoms in the branch and root. So specific are these symptoms that it is pos-

sible to identify the particular metal missing in the nutrient.

Again it must be reported that progress in cancer research is slow. Certain results have been obtained, however, which are of interest. In the treatment of this disease, extracts from the placenta and certain sulphur compounds have been used with more or less beneficial effects. Strong reports that he has observed that breast tumors of mice soften, liquefy, and finally regress or disappear upon oral administration of heptylaldehyde. Methyl salicylate augments its activity. It is to be remembered that both of these substances are found in the natural oil of wintergreen.

In concluding this review mention should be made of two other fields of investigation. In studying the mechanism of nerve-transmission it has been observed that in every voluntary or involuntary movement a minute amount of acetylcholine is produced at the end of the nerve fibers. This compound then sets the muscle into motion. In the field of immunological chemistry Goebel reports that he has prepared an artificial antigen which protects rabbits against pneumonia. No bacterial product is used in the synthesis. Another antigen, which protects the body against scarlet fever, and childbed fever streptococci, has been prepared by Swag and Lackman. In their preparation bacterial products are used but the process is carried out without the usual immunological procedures involving the use of animals.

BIRMINGHAM-SOUTHERN COLLEGE. A coeducational institution for higher learning in Birmingham, Ala., founded in 1856. The enrollment for the autumn of 1938 was 927 full-time students and 285 part-time students, and for the summer session, 441. There were 59 faculty members. The endowment amounted to \$692,915, and the income for the year was \$280,796. There were 46,000 volumes in the library. President, Raymond Ross Paty, A.B., A.M., LL.D., inducted in July, 1938.

BIRO-BIDJAN, bē'rō-bī-jän'. A district in the Far Eastern Territory of the U.S.S.R., set aside in 1928 for colonization by Jews and made a Jewish Autonomous Territory by the decree of May 7, 1934. Area, 27,000 square miles; population, 50,000 (1934 estimate) of whom 10,000 were Jews and the remainder chiefly Russians and Koreans. See RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC; UNION OF SOVIET SOCIALIST REPUBLICS.

BIRTH CONTROL CLINICAL RESEARCH BUREAU. The Birth Control Clinical Research Bureau was the first birth-control clinic to be legally established in America, and it is today the largest contraceptive clinic in the world. It was founded by Mrs. Margaret Sanger, who has directed its activities from 1923 until the present time. The Bureau provides clinical facilities for patients entitled to contraceptive advice under the laws of New York State, and promotes clinical and laboratory research, and the scientific study of contraceptive techniques and methods. To date, 68,000 patients have been instructed, representing every walk of life, every diversity of race, religion, and education. The Bureau also serves as an instruction center and model clinic for physicians, medical students, nurses, and social workers from this country and abroad, who wish to establish similar services in their own communities or countries.

The *Journal of Contraception*, the first and only publication devoted exclusively to the clinical and biological aspects of human fertility, is published by the Bureau. The Bureau has affiliated with it

more than 160 clinics throughout the country, in a mutual effort to maintain and improve clinic service. In 1936 the educational program of the Bureau was enlarged to meet the increased requests for advice and assistance from individuals and organizations, which followed the notable decision of the U.S. Circuit Court of Appeals for the Second Circuit, clarifying the legal right of the medical profession to give contraceptive advice, and from the subsequent medical recognition of birth control by the American Medical Association. Six Field Workers are now assisting in the establishment of clinics, and encouraging public health agencies to include birth-control service in their health programs. Literature, scientific motion-picture films for the medical profession, and phonograph records are available to organizations, medical groups, and interested individuals. A new talking-slide film "Why Let Them Die?" is also available for the general public. See CHILD WELFARE.

Officers of the Bureau are: Mrs. Margaret Sanger, director; Hannah M. Stone, M.D., medical director; Robert L. Dickinson, medical consultant; Clarence J. Gamble, M.D., medical field director; J. Noah H. Slee, treasurer. Headquarters, 17 West 16th St., New York City. Southern Regional Office, 715 E. St., S.W., Washington, D. C.

BIRTH RATES. See FRANCE, GERMANY, GREAT BRITAIN, SPAIN, ITALY, and JAPAN, and other principal countries under *Area and Population*; CHILD WELFARE.

BOILERS, STEAM. The number of new boiler installations for which orders were placed during 1938 was hardly sufficient to form a basis upon which to note any additional trends. The majority of such units were of small or medium capacity, designed to operate at moderate steam pressures and intended for industrial or institutional power plants, only three or four important contracts having been placed by the utilities. In view of this, most of the boilers sold during the year were of conventional design. However, as the year drew to a close there were some indications of increased activity in the field, involving advancement of construction schedules.

Some large-capacity high-pressure steam generating units upon which construction was begun in 1937, were completed and placed in service during the past year. In a few cases problems, incident to new designs and severe operating demands, were encountered. These pertained particularly to slagging of certain heat-transfer surfaces, feedwater conditioning, and circulation, but these difficulties have now been largely overcome.

Such a unit involves more than a boiler; it is a completely co-ordinated assembly of fuel-burning equipment, furnace, boiler, superheater, economizer, air preheater, and draft fans. It requires close design to meet the steam conditions, load demands, performance, and fuel characteristics specified. It is therefore sensitive to any departure from the anticipated conditions, particularly as pertain to variations in the quality of fuel burned or the feedwater conditioning employed. In general, this does not apply to such an extent in the case of units of moderate capacity and medium steam pressures, where operating conditions are usually less severe. The reliability of the modern steam-generating unit

is very high and comparable with that of the turbine which it serves.

Steam-generating units ranging from 300,000 to 1,000,000 lb. per hour capacity at 1200 to 1400 lb. per sq. in. pressure and 900 to 935 F. total steam temperature are now common in the utility field, as well as others employing a more moderate pressure of 800 to 900 lb. per sq. in. and around 900 F. steam temperature. The older low-pressure stations are rapidly being "topped" by high-pressure units, or placed in reserve, the low-pressure boilers in the "topped" plants being removed.

In the industrial power plant field, the majority of the newer boiler installations, except those of small capacity, employ pressures of 400 to 700 lb. per sq. in., and a few large outstanding plants have adopted 900 to 1400 lb. per sq. in. One plant has been designed for 2200 lb.

For industrial plants the more or less standardized two-drum, bent-tube steam-generating unit of self-contained design with extended furnace is gaining favor for capacities ranging from 20,000 to 200,000 lb. of steam per hour and pressures up to 750 lb. per sq. in. Such a unit is compact, has a low draft loss, and can be installed at moderate cost. It is adapted to burning any kind of fuel and has an efficiency of 80 to 82 per cent, or 84 to 86 per cent when equipped with an air preheater which is essential when burning pulverized coal.

An extension to one electric utility plant in the Middle West is now under construction for a steam pressure of 2400 lb. per sq. in. and preliminary studies have been made involving such a pressure for at least two other plants. The boiler in the first case mentioned is being designed for natural circulation. However, as the pressure of the steam is increased its specific weight approaches that of the water and the difference, upon which the effectiveness of natural circulation depends, becomes less. Because of this, some engineers are giving thought to the adoption of forced circulation, by means of a pump, where such extremely high pressures are involved. Forced-circulation boilers, heretofore, have not been accorded much consideration in this country although employed extensively in Europe for units of moderate capacity.

Bent-tube, multi-drum designs continue to be favored over the straight-tube, single-drum, header type, particularly for large and medium capacity units because of their more positive circulation. Bare-tube water-cooled furnaces predominate with high rates of heat absorption and, in the case of large pulverized-coal-fired units, the continuous slagging bottom method of ash disposal is being employed where the ash fusing characteristics and load conditions permit. Boiler drums are now quite generally fusion welded, annealed, and examined by X-ray before installation. These drums are made from steel having a tensile strength of 70,000 lb. per sq. in.

While practically all the newer large-capacity steam-generating units have been fired with pulverized coal, as well as about half those of medium capacity, the smaller boilers are generally stoker fired. On the other hand, in localities where natural gas or oil are plentiful and available at attractive prices, these fuels have been employed for boilers of all sizes. Despite this, in many cases provisions have been made for changing over readily to pulverized coal should future fuel prices make such a switch desirable. This can be done very easily inasmuch as a furnace that is proportioned for oil or gas is also adapted to burning pulverized

coal. In other cases provisions have been made for dual firing of two or more fuels.

The use of steam washers, placed in the steam drum of the boiler, is steadily increasing, especially for larger units and where the pressures exceed 400 lb. This insures clean steam to the turbine and the avoidance of deposits on the turbine blading which reduces capacity and often involves outages for removal of the deposits.

With practically all large steam-generating units, and many of medium capacity, automatic combustion control is now employed. Also, in superimposed installations automatic control is necessary for the pressure-reducing valves between the high- and the low-pressure systems and also the desuperheating equipment, in order to protect the low-pressure turbines and piping, should the high-pressure turbine be tripped out of service from any unforeseen cause.

In view of the conditions imposed by present operating practice, involving high rates of heat transfer, high pressures, and high temperatures, attention continues to be focused on correct feedwater treatment, maintenance of the proper alkalinity of the feedwater, the elimination of oxygen in the feedwater through deaeration and control of the concentration of solids in the boiler water. Recent investigations by the U.S. Bureau of Mines and the University of Illinois Experiment Station have disclosed that the once-accepted sulphate-carbonate ratio for the feedwater does not inhibit caustic embrittlement under all conditions and further studies are being made to discover commercially available substances that will inhibit embrittlement under all conditions. The most promising of these at present appears to be lignin compounds.

BOLIVIA. A land-locked Andean republic of South America. Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the government.

Area and Population. The Bolivian Statistical Office in 1935 estimated the area at 513,218 square miles, exclusive of the Chaco region, divided between Bolivia and Paraguay in 1938. The population was estimated at 3,226,000 on Dec. 31, 1936, as compared with 1,766,451 at the census of 1900, the last census taken. The racial composition of the population was estimated by the Statistical Office in 1935 as follows: White, 402,692; mestizo, 849,776; Indian, 1,613,941; Negro, 6342; unknown, 298,056; total, 3,170,807. Those listed as white included some persons in the upper classes with an admixture of Indian blood. Estimated populations of the chief cities are: La Paz, 150,165; Cochabamba, 49,000; Potosí, 35,900; Santa Cruz de la Sierra, 31,323; Oruro, 30,000; Sucre, 26,113; Tarija, 11,950. Spanish is the language of the educated classes. The Indians speak mainly Quechua and Aymara.

Education and Religion. The 1900 census showed that 16.7 per cent of the population of over seven years of age had received school instruction. Illiteracy is believed to have declined somewhat since that time. The government in 1938 issued a decree requiring all children from seven to 14 years of age and all illiterates under 21 to attend school. In 1937 there were 5500 primary schools of all descriptions, 40 secondary schools giving a six-year course, and universities at La Paz, Sucre, Cochabamba, and Oruro (established 1937). The former university at Santa Cruz de la Sierra was re-established in 1938. Under the Constitution of 1938, the Roman Catholic Church is recognized and

supported by the state, but the public exercise of other forms of worship is guaranteed.

Production. The tin-mining industry, accounting for 70-75 per cent of all Bolivian exports and producing about 12 per cent of the world's tin in 1937, is the principal factor in the national economy. The metal content of tin-ore exports in 1937 was 25,500 metric tons (24,400 in 1936); of tungsten ore, 1081 metric tons; of lead ore, 18,200; zinc, 11,500; antimony, 7127. The output of petroleum was about 15,000 metric tons; the metal content of copper ore exports, 3700 metric tons; exports of silver, 294.1 metric tons. Agriculture and livestock raising are the other chief occupations. The principal crops are wheat, quinoa (resembling millet), corn, rice, barley, sugarcane, cotton, coca leaves, tobacco, and coffee. Manufacturing consists mainly of the production of alcohol and beverages, food-stuffs, textiles, and clothing.

Foreign Trade. Imports in 1937 were valued at 59,234,000 bolivianos (55,464,000 in 1936) and exports at 124,599,000 bolivianos (100,008,000 in 1936). Of the 1937 imports, the United States furnished 16,429,000 bolivianos; Peru, 9,272,000; Germany, 7,887,000; Argentina, 7,688,000; Great Britain, 4,673,000. Of the exports, Great Britain took 74,646,000 bolivianos (mostly tin for smelting); Belgium, 29,179,000; United States, 9,075,000; Netherlands, 5,838,000; Argentina, 2,203,000. Minerals normally account for about 98 per cent of all exports. The chief imports are cotton and wool textiles, wheat, flour, sugar, live animals, machinery and metal products, lumber.

Finance. Budget estimates for 1939 balanced at 300,669,856 bolivianos and those for 1938 at 274,123,000 bolivianos; the latter figure represented an increase of nearly 100 per cent over the 1936 budget estimate. Actual receipts in 1937 were reported at 266,000,000 bolivianos and expenditures at 275,000,000 bolivianos. The public debt on Dec. 31, 1937, totaled 2,333,500,000 bolivianos (foreign, 1,930,800,000; internal, 402,700,000), compared with 1,937,400,000 bolivianos on Dec. 31, 1936. The boliviano, par value \$0.617, exchanged at an average of \$0.03 in 1936 and \$0.0412 in 1937 (bank rate).

Transportation, etc. Bolivia in 1938 had 1402 miles of railway line in operation, 50 miles under construction, and 498 miles under survey. At the beginning of 1937 there were 4172 miles of roads; the number of automobiles was 4260. The total length of navigable rivers was 5600 miles. Five steamers ply the waters of Lake Titicaca (12,500 feet high). Air lines link the principal cities of the republic and connect with the Pan American and Junkers air networks, providing service to all European and American centers.

Government. The Constitution of 1880, as amended in 1931, established the democratic-republican form of representative government. Executive power was vested in a president elected for four years by direct vote of literate males; he was ineligible for re-election until eight years after the expiration of his term. The cabinet was chosen by the president and was responsible to a bicameral congress elected by direct suffrage.

The constitutional regime was suspended Nov. 28, 1934, when army leaders, dissatisfied with the conduct of the Chaco War, forced the resignation of President Daniel Salamanca. His successor, Provisional President José Luis Tejada Sorzano, was ousted May 17, 1936, by a bloodless military coup led by Lieut.-Col. Germán Busch. Col. David Toro, Chaco War hero, was made Provisional

President. His government abolished the 1880 Constitution in favor of a military-civilian dictatorship committed to state socialism. A second bloodless military coup d'état of July 17, 1937, forced out Toro and installed Busch as Provisional President. His government on July 31, 1937, announced the abandonment of state socialism and on August 1 it restored the 1880 Constitution. For developments in 1938, see *History*.

HISTORY

Constitutionalism Restored. Elections for a National Assembly to draft a new constitution were held Mar. 13, 1938. In 1937 Provisional President Germán Busch had proclaimed a general amnesty for exiled political opponents and pledged the unrestricted participation of all political parties in the National Assembly elections. However, Busch's chief rivals for the Presidency—ex-President Bautista Saavedra, leader of the Republican Socialist Party, and Carlos Calvo, presidential candidate of the Liberal Party—were not permitted to return from exile. Consequently the opposition parties abstained from voting in the March elections. The 18 Senators and 106 Deputies elected were, with the exception of several independents, all members of the government-sponsored Socialist United Front comprising Socialists, Chaco War veterans, and workers' organizations.

The Assembly convened in La Paz May 26 and the following day elected Lieutenant-Colonel Busch Constitutional President for a four-year term. Dr. Enrique Baldivieso, Socialist Party leader and former Foreign Minister, was elected Vice-President. Both officials were sworn in May 29. President Busch pledged himself to work for an early solution of the Chaco dispute with Paraguay and to completely reorganize Bolivia's administrative system. The same day he appointed a new cabinet, composed largely of civilians and with Dr. Eduardo Diez de Medina holding the Foreign Affairs portfolio. Immediately afterwards he authorized the exiled political leaders, Calvo and Saavedra, to return to Bolivia.

The draft of a new constitution containing radical reforms was submitted to the Assembly on June 8. Following its adoption October 28 President Busch and the members of his cabinet took the oath of office under the new Constitution on October 30. The Assembly then adjourned. It was scheduled to divide itself into a Senate and Chamber of Deputies and reassemble as the constitutional Congress on Aug. 6, 1939, unless the President convoked it before that date. On the day before adjournment, President Busch sent a message assuring the Assembly that his government had no "totalitarian ambitions" and would continue to follow democratic principles after the Assembly disbanded.

The New Constitution. The Constitution promulgated Oct. 30, 1938, declared Bolivia to be a unitarian republic with a representative democratic government. Executive power is vested jointly in the President and his Cabinet. The President and Vice-President are elected by direct suffrage for four years and may not succeed themselves. Legislative power rests in a National Congress composed of a Chamber of Deputies chosen by direct suffrage for four years (half elected every two years) and a Senate selected on the basis of three representatives from each Department. The Senators serve for six years and one-third are named every two years. Citizenship is restricted to Bolivians over 20 years of age who can read and write

and who are inscribed in the Civic Register. For a detailed analysis, see Beatrice Newhall, "The New Constitution of Bolivia," *Bulletin of the Pan American Union*, February, 1939, p. 100 f.

Internal Developments. The Busch Government had to contend not only with the agitation of opposition political groups but also with public hostility to some of the measures of the Assembly and with pressing economic and financial difficulties. In March ex-President Toro secretly left Santiago, Chile, where he lived in exile, and crossed into the Bolivian Chaco from northern Argentina. On March 30 he issued a manifesto to the officers of the Bolivian troops in the Chaco, urging them to join him in a revolt against the Busch regime. Failing to win the expected support, he fled back to Argentina. Several of his fellow-conspirators were arrested and one of them, Col. Juan de Dios Cárdenas, was sentenced to death May 4 by a military court. He was shot to death at Tarija May 8 while attempting to escape from prison, according to an official announcement.

Late in April the government banned "all Communist, Anarchist and Bolshevik activity" and on May 15 it prohibited agitation by all foreign elements in Bolivia. The latter decree mentioned no faction, but barred public meetings by foreign groups, the use or exhibition of factional symbols or insignia, and "all public actions that tend to reflect the political ideologies of foreign nations." Yet the government permitted 29 students to visit Germany for six months at the expense of the Hitler Youth organization.

On July 13 the National Assembly repealed Article IV of the 1880 Constitution guaranteeing freedom of the press and authorized the President to suppress "the national press of the extreme Right." Protests of newspaper publishers led President Busch to assure them on August 25 that the press retained full liberty. On July 31 Deputy Chief of Police Ernest Fleischman was ordered deported in connection with another alleged revolutionary conspiracy. Coincident with Bolivia's ratification of the Chaco Peace Treaty on August 12, the Cabinet resigned and President Busch appointed a new one composed chiefly of Socialists. On November 25 a revolt plot in La Paz was foiled by the arrest of 20 persons described as Leftist agitators. A nationwide state of siege was immediately proclaimed. Two days later the government announced that eight leaders of the movement had been imprisoned.

In the economic and financial field, the Busch Government undertook a three-point program of reform. Two rates of exchange, based on the pound sterling sight rate, were established by the decree of June 11 in place of the three separate rates previously in effect. Foreign exchange for government expenditures was made purchasable at 100 bolivianos to the pound, while the second rate of 140 bolivianos to the pound applied to exchange acquired for all other purposes, including imports. Secondly, it was announced that an Agricultural Bank, with a capital of 14,000,000 bolivianos, would be established to promote agricultural production and eliminate the need for importing food supplies. The third point called for balancing the budget. However, the country's economic and financial difficulties were enhanced by restrictions on tin exports and the low price received for tin. Tin prices rose from approximately £150 sterling per ton during the early part of the year to around £220 per ton during December.

The National Assembly also created a Ministry

of Health and Hygiene and allotted up to 10,000,000 bolivianos for its work. The 1936 decree canceling the Standard Oil petroleum concession was approved. New taxes and authorization to borrow additional funds provided for increased railway and highway construction and the improvement of education and public health. The National Territory of Colonies in northeastern Bolivia was transformed into the Department of Pando, with Cobija as the capital. The department in turn was subdivided into the four provinces of Tahuamanu (capital, Cobija), Abuná (Manoa), Manuripi (Puerto Rico), and Madre de Dios (Las Piedras). Gabriel René Moreno University in Santa Cruz de la Sierra was re-established. The flour monopoly was abolished. A presidential decree of November 11 extended and raised existing sales taxes.

Other legislation passed during the year included a decree of April 8 relaxing restrictions on gold mining. The decree of April 22 required all public officials, members of the government and their relatives and intimate friends to declare the property which they owned in July, 1932, and that owned on the date of the decree, the object being to uncover fortunes acquired by profiteering or graft during and after the Chaco War. The decree further provided that thereafter all important public officials and those handling funds of the government, municipalities, or universities should state under oath the amount of their property on assuming and leaving their positions. The decree law of May 11 provided for the establishment of a fund permitting the retirement of journalists on full pay after 25 years of service. The Council of National Economy, created by decree in August, 1937, began to function on Jan. 3, 1938. In September the government had to contend with a serious outbreak of bubonic plague at Choreti in the Bolivian Chaco.

The Chaco Settlement. The 86-year-old boundary dispute between Bolivia and Paraguay that resulted in the sanguinary Chaco War of 1932-35 was settled by a Treaty of Peace, Friendship, and Boundaries signed at the Chaco Peace Conference in Buenos Aires on July 21, 1938, and the arbitral award of October 10. See CHACO DISPUTE, SETTLEMENT OF, for full details.

The settlement cost Bolivia much of the Chaco territory she held at the beginning of the war with Paraguay. But it satisfied in part Bolivia's demands for outlets to the Paraguay River and conferred other advantages. Because of these provisions the peace treaty was ratified by the National Assembly, 102 to 9, and was generally approved by Bolivian public opinion. Other factors inducing the settlement were the precarious financial condition in which Bolivia was left by the Chaco War, the heavy burden of maintaining a large force in the distant Chaco after the 1935 truce, the unwillingness of the Bolivian people to consider another war, and the sincere response to insistent appeals of neutral American governments and peoples for inter-American peace.

Other Foreign Relations. With the Chaco dispute disposed of, the Bolivian Government proceeded with the diplomatic negotiations and economic arrangements started in 1936 with Argentina, Brazil, Chile, and Peru for the purpose of providing new and improved facilities for Bolivia's internal and external commerce (see 1937 YEAR BOOK, p. 97). All of these economic, commercial and railway agreements were ratified by the National Assembly along with treaties definitely fixing the boundaries of Bolivia with Peru, Chile, and Argentina as well as Paraguay.

On Feb. 25, 1938, Bolivia signed two important treaties with Brazil, carrying into effect the recommendations submitted the previous October by a mixed Bolivian-Brazilian commission. One of these provided that £1,000,000 sterling due Bolivia from Brazil under the treaty of Dec. 25, 1928, should be applied to the construction of a railway linking Santa Cruz de la Sierra in eastern Bolivia with the Brazilian railway network at a point between Porto Esperança, Brazil, and Corumbá, Bolivia. Brazil agreed to lend Bolivia the additional amounts needed to complete the railway, the loan to be repaid in 20 annual installments either in sterling or in equivalent quantities of Bolivian crude petroleum or gasoline. The final survey of this railway was begun Jan. 25, 1938, and was to be completed within one year. Brazil was to proceed immediately to extend the Northwestern Railway of Brazil from Porto Esperança to Corumbá.

The same treaty bound Bolivia to construct and operate railways from the oil refinery at Camiri to Santa Cruz de la Sierra and from Camiri to Sucre on the Bolivian plateau, the latter already partly constructed. Moreover, Bolivia and Brazil agreed to co-operate in completing the Cochabamba-Santa Cruz railway, started in 1928 with an American loan, and in building a branch line from Santa Cruz de la Sierra to Puerto Grether or another point on the Ichilo River, thus affording an improved outlet for eastern Bolivia via the Amazon waterways system. Completion of the Cochabamba-Santa Cruz-Porto Esperança lines would link the Bolivian and Brazilian railway systems and permit direct transcontinental railway traffic between Santos, Brazil, and Arica, Chile.

The second Bolivian-Brazilian treaty provided for joint exploration and exploitation of the Bolivian petroleum deposits in the eastern foothills of the Andes north of the Parapeti River. In an exchange of notes between Bolivia and Brazil on the same date these treaties were signed, Brazil declared that she "considers as definite and, therefore, not susceptible to any modifications except those made by Bolivia's own will, the territorial status of Bolivia in the part in which this status has been juridically defined and formally admitted or recognized by it. With respect to the part yet to be defined (in the Chaco Boreal), Brazil will recognize and respect only what is freely covenanted, in accordance with the principles of international law, in general, and especially in accordance with the (inter-American) declaration of Aug. 3, 1932, which it hereby affirms." This declaration had a direct bearing upon Bolivia's territorial dispute with Paraguay. The two treaties were ratified by the Constitutional Assembly at La Paz August 19 by a vote of 88 to 11.

It was announced in Santiago, Chile, on June 7 that in accordance with the commercial and transit agreements concluded by Bolivia and Chile in 1937, Bolivia would establish its own customs facilities at Arica, the Chilean port through which the bulk of Bolivia's foreign trade passes. A reciprocal Bolivian-Chilean commercial treaty was signed at La Paz, May 21, 1938. The Bolivian Constitutional Assembly also approved during 1938 the Protocol of May 1, 1907, thus ratifying the Bolivian-Chilean treaty of Oct. 20, 1904, and providing for readjustment of their common frontier through mutual concessions. Chile had approved this protocol in August, 1917. Despite these agreements, Bolivia's oft reiterated desire for a Pacific port was again proclaimed by the Bolivian Foreign Minister at the Pan American Conference at Lima in December,

Chile replied unofficially that no further concessions could be made.

The rapprochement between Bolivia and Argentina, inaugurated in 1936 and 1937, was furthered during 1938. The Argentine-Bolivian boundary treaty, signed in 1935 and subsequently ratified by Bolivia, went into effect with its ratification by the Argentine Congress on September 7. Under the Bolivian-Argentine railway and petroleum treaties of 1937, mixed technical commissions conducted surveys during 1938 for the projected joint railway constructions and oil-field developments in that part of eastern Bolivia south of the Parapeti River.

A treaty with Peru, providing for an exchange of territories on the Copacabana Peninsula in Lake Titicaca, was ratified by the Bolivian National Assembly on October 3 by a vote of 38 to 34. On November 10 leading Bolivians, with the approval of the government, formed the Crucista Society, named after President Santa Cruz of the Peruvian-Bolivian Confederation and dedicated to the promotion of closer cultural and commercial intercourse between the two countries. A society with the same name and purpose already existed in Peru.

BOSTON UNIVERSITY. A nonsectarian institution of higher education in Boston, Mass., founded in 1839 and chartered as Boston University in 1869. The enrollment for the autumn session of 1938 was 11,621, distributed as follows: College of liberal arts, 922; college of business administration, 3269; college of practical arts and letters, 566; college of music, 209; Sargent college of physical education, 258; school of theology, 252; school of law, 393; school of medicine, 199; school of education, 2547; school of religious and social work, 167; graduate school, 502. The enrollment for the 1938 summer session was 2035. The University faculty numbers 630. Total income for the year 1937-38, \$1,992,477. The endowment amounted to \$5,121,780. Total volumes in the libraries, 185,000. The Charles Hayden Memorial, the new \$1,150,000 building for the College of Business Administration, is under construction and will be ready for occupancy in June, 1939. President, Daniel L. Marsh, Ph.D.

BOTANY. Origin and Distribution of Cultivated Plants. The origin of our cultivated plants has always aroused a great deal of botanical interest. Most of them originated in prehistoric periods and consequently no written records are available. The problem can be solved only by collecting wild plants in their probable home and then attempting to trace out their history in connection with their modern cultivated representatives. Kempton (*Smithsonian Inst. Ann. Rept.* 1937: 385-408) has contributed an interesting account of maize from the standpoint of the American Indian and has discussed some of the theories as to its place and method of origin. Three general theories regarding the origin of maize have been proposed. One view is that it developed from pod-corn; a second theory suggests that maize originated from teosinte; and a third that maize, teosinte, and related grasses have descended independently from a remote common an-

cestor. Mangelsdorf and Reeves (*Proc. Nat. Acad. Sci.* 24: 303-312) have approached the problem from the standpoint of hybridization, and have come to the conclusion that maize has descended from a wild plant which has hybridized with gamma grass or some similar type. Pod-corn is considered as a close representative of the ancestral form. Teosinte is excluded from the origin since it, in their view, is a hybrid. The accumulated evidence is that maize originated in Peru and not in Central America or Mexico. Merrill (*Bot. Rev.* 4: 1-20) has been interested in the problem of the distribution of plants by migrating peoples and has summarized the work in a recent paper in which the relation of domesticated plants to the diffusion of culture is considered. A long list of food plants are of American origin and became known to Europeans after the discovery of America in 1492. Man is the most important factor in their dissemination. David Fairchild has been associated for nearly forty years with the introduction of useful plants of foreign lands into the United States. His trips of exploration have taken him to many different parts of the world, and he has brought back, in the course of the years, a large number of useful plants. The interesting story of his travels as a plant explorer is told in his recent book *The World Was My Garden* (494 p., Scribners).

The Longevity of Plants. Some years ago, Molisch published an interesting book summarizing the information on the longevity of plants, a book which has recently been translated by Fulling (226 p., Science Press). This topic has always aroused the interest of biologists, and in this work extensive data are given on the longevity of both unicellular and multicellular organisms, as well as information concerning the means of prolonging the life of plants, their rejuvenescence, death, and the alleged potential perpetual life of a tree.

Plant Growth. Problems of growth have been attacked from different standpoints. Of special interest are those papers concerned with the role of vitamin B₁. In the culture of many fungi, difficulties have been encountered in getting adequate growth, and Robbins and Kavanagh (*Amer. Jour. Bot.* 25: 229-236; *Bull. Torrey Bot. Club* 65: 453-461) have published interesting results on the influence of vitamin B₁, or thiamin, and its intermediates pyrimidine and thiazole. They find that thiamin is essential for some fungi, while others can use intermediates as well. Noecker (*Amer. Jour. Bot.* 25: 345-348) has attacked the same problem in connection with the cultivation of certain species of wood-destroying fungi, and Bonner and Erickson (*Amer. Jour. Bot.* 25: 685-692) have contributed a paper on the value of the mold *Phycomyces* as an assay for thiamin. Bonner (*Amer. Jour. Bot.* 25: 543-549) has studied the effect of vitamin B₁ on the growth of roots.

Thimann and Schneider (*Amer. Jour. Bot.* 25: 270-280) have investigated the role of salts and hydrogen-ion concentration in the response of the coleoptile of *Avena* to auxins, and Schneider (*Amer. Jour. Bot.* 25: 258-270) has studied the interdependence of auxin and sugar for growth. Beal (*Bot. Gaz.* 99: 881-911) has reported on the histological responses of species of *Lilium* to indoleacetic acid. Hamner (*Bot. Gaz.* 99: 912-954) has studied the histological changes of *Mirabilis jalapa* to this same substance. Mitchell and Hamner (*Bot. Gaz.* 99: 569-583) have reported on the stimulating effect of beta(3)indoleacetic acid on the synthesis of solid matter by bean plants.

The Role of Selenium. In recent years, the chemical element selenium has been definitely as-

sociated with a type of stock poisoning in the West, where animals graze on certain kinds of plants. Moxon et al. (*Amer. Jour. Bot.* 25: 794-809) have worked out the distribution of selenium in Cretaceous formations of South Dakota and determined the selenium content in some of the associated vegetation. Martin and Trelease (*Amer. Jour. Bot.* 25: 380-385) have studied the absorption of selenium by tobacco and soybeans in sand cultures. Trelease and Trelease (*Amer. Jour. Bot.* 25: 372-380) have carried out some experiments which indicate that selenium is a stimulating and possibly an essential element of certain indicator plants. Hurd-Karrer (*Amer. Jour. Bot.* 25: 666-675) has given further data on the relation of sulphate to the absorption of selenium.

Photoperiodism. Allard (*Jour. Agric. Res.* 57: 775-789) has continued his studies on the influence of length of day on plants. Both long and short day plants have been known for several years. Allard now finds that certain plants come into the flowering condition when the days are neither too long nor too short; in other words, they are intermediate in their length of day requirements. Such intermediate behavior has been found in *Mikania scandens*, *Phaseolus polystachyus*, and *Eupatorium torreyanum*. The narrowest flowering response of any plant studied is a wild New Guinea sugarcane, the flowering range lying somewhere between 12 and 14 hours of daylight. Borthwick and Parker (*Bot. Gaz.* 99: 825-839; 100: 374-387) carried out various experiments on the photoperiodic reaction of soybeans, and Hamner and Bonner (*Bot. Gaz.* 99: 615-629; 100: 388-431) have considered the effects of environmental factors on photoperiodism and the relation of hormones to floral initiation and development.

Nutrition. Many interesting contributions on various phases of plant nutrition have been published. Dawson (*Bot. Gaz.* 100: 336-346) has studied the relation between nicotine synthesis in tobacco and the nitrogen supply. Archbold (*Ann. Bot.*, N. S. 2: 183-202; 403-435) has published additional papers dealing with the role of fructosans in the carbohydrate metabolism of the barley plant. Richards (*Ann. Bot.*, N. S. 2: 491-534) has contributed a paper on the relation of the respiration rate to the carbohydrate and nitrogen metabolism of the barley as determined by the supply of phosphorus and potassium. Petrie and Wood (*Ann. Bot.*, N. S. 2: 33-60; 729-750; 887-898) have carried out studies on the nitrogen metabolism of plants, particularly in connection with the relation between the content of proteins, amino-acids, and water in the leaves; the interrelations among soluble nitrogen compounds, water and the respiration rate; and also on the effect of water content on the relationship between proteins and amino-acids. Gregory and Purvis (*Ann. Bot.*, N. S. 2: 237-251; 753-764) have made additional interesting studies in the vernalization of cereals, especially in the use of anaerobic conditions in the analysis of the vernalizing effect of low temperature during germination.

Cytology and Genetics. Recently, the alkaloid colchicine has come into prominence in connection with the production of polyploids. Nebel and Ruttie (*Jour. Hered.* 29: 3-9) have made a contribution on the cytological and genetical significance of colchicine. Polyploids of marigold, petunia, snapdragon, and other plants have been produced. From a cytological standpoint, colchicine inhibits spindle formation and thus the cells become polyploid. Walker (*Amer. Jour. Bot.* 25: 280-285) has de-

scribed in detail the effect of colchicine on the microspore mother cells and microspores of *Tradescantia*.

Emsweller and Jones (*Bot. Gaz.* 99: 729-772) have studied the crossing-over, fragmentation, and formation of new chromosomes in a hybrid between species of *Allium*. McClintock (*Genetics* 23: 315-376) has studied the production in maize of homozygous deficient tissues with mutant characteristics by means of the aberrant mitotic behavior of ring-shaped chromosomes. MacArthur and Butler (*Genetics* 23: 253-268) have studied the inheritance of size and geometric growth processes in the fruit of the tomato. Sax (*Genetics* 23: 494-516) has reported on the aberrations of chromosomes induced by X-rays. Saunders and Stebbins (*Genetics* 23: 65-82; 83-110) have made cytogenetic studies in *Paeonia*, one paper dealing with the compatibility of the species and the appearance of the hybrids, and another being concerned with the cytology of the diploid species and hybrids. The old problem of sexuality in the powdery mildews has been raised anew by Colson (*Ann. Bot.*, N. S. 2: 381-402) in her studies on the cytology and development of *Phyllactinia corylea*. She concludes that there is no fusion between the nuclei of the antherid and the oogonium, although earlier workers have described this fusion in detail.

Some years ago, Small and Alexander described a large number of so-called "new species" of iris from the Delta Region of Louisiana. The question has been raised as to whether these were actually species, or hybrids. Riley (*Amer. Jour. Bot.* 25: 727-738) has contributed a study on colonies of *Iris fulva*, *I. gigantea*, and their natural hybrids and has come to the conclusion that many of the types of iris plants discovered in Southern Louisiana have originated as crosses between these two species.

Taxonomy. Merrill (*Jour. Arnold Arbor., Harvard Univ.* 19: 21-70) has recorded extensive additions to the Indo-Chinese plants. Among the 191 species described, 39 are recorded as new; in addition, two new genera are listed. Clausen (*Memoirs, Torrey Bot. Club* 19: 1-177) has published a monograph on the world-wide distribution of the Ophioglossaceae, an important family of the fern group. Altogether, three genera and a total of 52 species are recognized, two of the latter being new. Accounts of the botanical collections of the Second Byrd Antarctic Expedition have appeared (*Ann. Mo. Bot. Gard.* 25: 467-727). The plants were collected on Marie Byrd Land during the Second Expedition in Little America in 1934. Throughout Marie Byrd Land there are thousands of plant colonies, some of which are represented by a very dense growth of lichen forms. Siple has described the ecology and geographical distribution; Dodge and Baker listed the lichens and lichen parasites; and Bartram the mosses. Five species of mosses and 89 species of lichens, many of the latter new, have been described. Sherff (*Ann. Mo. Bot. Gard.* 25: 1-94) has published a revision of the Hawaiian species of *Euphorbia*, listing 21 distinct species and several varieties. Epling (*Ann. Mo. Bot. Gard.* 25: 95-188) has published a paper on the Californian species of *Salvia*, recognizing 18 species with numerous sub-species. Of special interest is the recording of 11 hybrids between certain of the species. Krukoff and Moldenke (*Brittonia* 3: 1-74) have made a study of American Menispermaceae, with particular reference to the species used in the preparation of arrow-poisons. Altogether, 7 genera and 63 species were treated.

Sherff (*Field Mus. Nat. Hist.*, Bot. Ser. 16: [Pt. 1, 2] 1-709) has published a very extensive monograph on the genus *Bidens*, bringing together an account of the species in various parts of the world. The 233 species of the genus are described and illustrated by 189 plants.

Cryptogamic Botany. This expression, which has been used to cover all plants below the seed plants, has been revived by Smith in his new two-volume work *Cryptogamic Botany* (McGraw-Hill). The first volume is devoted to a general treatment of the algae and fungi, and the second to the liverworts, mosses, and ferns. The general morphological and phylogenetic point of view is presented.

Two new books on the algae have been published. Tiffany's *Algae, the Grass of Many Waters* (171 p., Thomas) is a well-illustrated, interesting book on this group of plants. It takes up the question as to how the algae grow and reproduce; the algal floras of lakes, ponds, streams, soil, ice, and snow; the algae of the past; and relation of algae to human welfare. Taylor's book *Marine Algae of the Northeastern Coast of North America* (427 p., Univ. of Mich. Press) is a valuable work dealing with the characteristics and identification of the algae along the seacoast. It is a much-needed work, since no recent book along these lines has been published. Small has published an extensive work on *Ferns of the Southeastern States* (517 p., Science Press). This is valuable as a manual for this general region.

BOUNDARY DISPUTES. See CHACO DISPUTE, SETTLEMENT OF; ARGENTINA, CHILE, COSTA RICA, CZECHO-SLOVAKIA, ECUADOR, HONDURAS, HUNGARY, IRAQ, MANCHOUKUO, PARAGUAY, and POLAND under *History*.

BOWDOIN COLLEGE. An institution of higher education for men in Brunswick, Me., founded in 1794. The enrollment for the autumn session of 1938 was 641. There were 57 faculty members and four Teaching Fellows. The productive funds of the college amounted to \$8,215,542, and the income for 1937-38 was \$627,673. The library contained more than 176,000 volumes. President, Kenneth Charles Morton Sills, LL.D.

BOWLING. See SPORTS.

BOXING. See SPORTS.

BOYS' CLUBS OF AMERICA, INC. A national organization formed in 1906, with headquarters at 381 Fourth Ave., New York City. Membership in a Boys' Club is open to boys of all races and creeds from the age of 8 to 18. Through interesting boys in supervised leisure-time activity, Boys' Clubs have an opportunity to do character formation work of distinct value. They specialize in service to the underprivileged boy. Latest statistics give a federation of 342 Boys' Clubs in 190 cities in 37 States, with an enrollment of 300,000 boys. The Boys' Club Federation of Canada, with 21 Boys' Clubs, is affiliated with Boys' Clubs of America.

The officers in 1938 were: President, William Edwin Hall; chairman of the Board, Herbert Clark Hoover; secretary, William Ziegler, Jr.; treasurer, Albert H. Wiggins, and executive director, Sanford Bates.

BOY SCOUTS OF AMERICA. An organization incorporated in 1910, and chartered by Congress in 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. Each boy, on joining the organization, takes the Scout Promise to keep himself "physically strong, mentally

awake, and morally straight." The movement is nonsectarian and without military or political connection.

The membership as of October, 1938, numbered 1,221,338; 809,850 were Scouts, 116,151 Cubs, and 269,621 Adult Leaders. There were 12 regional districts subdivided into 535 Local Councils.

The official magazine for boys is *Boys' Life*, and for Scout Leaders *Scouting*. The National Officers in 1937 were: President, Walter W. Head; Treasurer, Lewis Gawtry; National Scout Commissioner, Daniel Carter Beard; Chief Scout Executive, James E. West; Deputy Chief Scout Executive, George J. Fisher. Headquarters of the National Council are at 2 Park Avenue, New York City.

BRAZIL. A republic of South America, comprising 20 States, the Federal District, and one Territory. Capital and largest city, Rio de Janeiro.

Area and Population. Brazil has an area of 3,286,170 square miles and a population estimated on Dec. 31, 1937, at 43,247,000 (30,635,605 at the 1920 census). The population is greatly mixed, with Portuguese, Italian, Spanish, and German strains predominating in the central and southern States and with strong infusions of Negro and Indian blood in the north. Japanese constitute nearly 20 per cent of the population of the State of São Paulo; they occupy less than 2 per cent of its land but produce 30 per cent of all farm crops in the State. Portuguese is the official and principal language, although German and Italian are widely used in the south. Estimated populations of the chief cities in 1936 were: Rio de Janeiro, 1,711,466; São Paulo, 1,120,405; Recife, 472,764; Bahia de São Salvador, 363,726; Porto Alegre, 321,628; Belém, 293,036; Bello Horizonte, 167,712; Fortaleza, 143,277; Maceió, 129,105; Nictheroy, 125,247; Curitiba, 116,632; João Pessoa, 101,280; Manaus, 89,346.

Education and Religion. The population is estimated to be about 70 per cent illiterate. There were 33,251 schools of all types in 1935 (29,553 primary, 447 high schools, 383 domestic schools, 328 normal schools, 874 special schools, and 248 superior schools conferring degrees) with a total of 65,731 teachers and 2,574,802 students and pupils. There are also four universities—at Rio de Janeiro, Porto Alegre, Bello Horizonte, and Curitiba—besides various other faculties that confer degrees. Roman Catholicism is the predominant religion, but there are many followers of various Protestant denominations, Judaism, Buddhism, Mohammedanism, etc.

Production. Agriculture, stock-raising, and manufacturing are the chief occupations. Brazil ranks first in the world in production of coffee, second in cacao, and third in sugar and tobacco. Coffee annually accounts for between 60 and 75 per cent of the value of all exports. Coffee production in 1937-38 was about 1,547,900 metric tons (1,577,000 in 1936-37). The cotton acreage increased from 1,967,960 hectares in 1936 to 2,211,000 hectares in 1938 (hectare equals 2.47 acres) and the yield in 1937-38 was 478,000 metric tons, ginned (400,000 in 1936-37). Production of other leading crops in 1936-37 was (in metric tons): Wheat, 150,000; barley, 11,300; rye, 16,000; oats, 13,800; corn, 6,625,500; rice, 1,250,200; potatoes, 334,200; cacao, 127,200; cane sugar, 958,700 (about 1,017,000 in 1937-38); tobacco, 93,400; cotton-seed, 1,113,700 in 1937-38. The wool clip in 1936 was 17,000 metric tons. The estimated number of livestock slaughtered in 1936 was: Cattle and calves, 4,538,-

000; sheep, 309,000; goats, 200,000; swine, 2,769,000.

Output of the chief mineral and metallurgical products in 1937 were (in metric tons): Coal, 762,789 (value, 40,054,000 milreis); manganese ore (exports), 247,115 (value, 44,730,000 milreis); cement, 571,452 (value, 125,342,000 milreis); salt, 390,000 in 1936; iron ore (metal content), 20,000 in 1936; pig iron and ferro-alloys, 78,000 in 1936; steel, 74,000 in 1936. Gold production in 1937 was 4534 kilograms, valued at 80,617,000 milreis. Diamonds, monazite, chrome, and other minerals are produced. The forests yield hardwoods, rubber, carnauba wax, oil seeds, and kernels. Cotton weaving is the leading manufacturing industry. Other manufactures are clothing, metal products, chemicals, electric power and ice, wood products, construction materials, ceramics, paper, leather, refined sugar, tobacco products, flour, meat products.

Foreign Trade. Imports in 1937 were valued at 5,314,551,000 milreis (4,268,667,000 in 1936) and exports at 5,092,059,000 milreis (4,895,435,000 in 1936). In U.S. paper dollars, imports in 1937 totaled \$330,554,094 (\$246,718,000 in 1936); exports, \$347,565,000 (\$320,043,000 in 1936). Leading 1937 imports in order of value were: Machinery, apparatus, utensils and tools, \$62,521,000; foodstuffs and beverages, \$59,446,000; iron and steel and their manufactures, \$45,512,000; motor cars and trucks, \$16,611,000. The chief exports were: Raw coffee, \$147,394,000; raw cotton, \$64,458,000; cacao, \$15,645,000; cattle hides, \$15,185,000; oilseeds and kernels, \$14,607,000. The distribution of trade is shown in the accompanying table.

BRAZILIAN TRADE WITH CHIEF COUNTRIES
[Value in thousands of dollars]

Country of origin or destination	General imports		Exports of Brazilian products	
	1936	1937	1936	1937
United States	54,661	76,410	124,328	126,328
Germany	57,948	79,013	42,209	59,502
United Kingdom . . .	27,739	39,926	38,227	31,296
France	7,259	7,796	23,681	22,318
Argentina	40,561	45,827	13,000	16,502
Japan	2,865	5,326	13,719	16,404
Per cent of total:				
United States	22.2	23.1	38.8	36.3
Germany	23.5	23.9	13.2	17.1
United Kingdom . . .	11.2	12.1	11.9	9.0
France	2.9	2.4	7.4	6.4
Japan	1.2	1.6	4.3	4.7
Argentina	16.4	13.9	4.1	4.7

Finance. The budget estimates for 1938 placed total revenues at 3,823,623,000 milreis and expenditures at 3,875,227,000 milreis. For 1939 the respective estimates were 4,071,000,000 and 4,065,000,000 milreis. The 1939 budget did not provide for extraordinary expenditures in connection with the proposed five-year plan and special requirements of the army and navy.

In 1937 actual current revenues were 3,462,476,000 milreis and capital revenues were 1,742,354,000 milreis including 1,478,029,000 raised through credit operations. Current expenditures were 4,143,959,000 milreis and total expenditures 5,204,830,000 milreis, which balanced with total receipts. The internal funded debt on Dec. 31, 1937, was 3,748,252,000 milreis and the internal floating debt, including 4,532,450,000 milreis of money in circulation, was 6,979,366,000 milreis. The external debt on the same date was divided as follows: 104,192,440 pounds sterling, 229,185,500 gold francs, 273,634,213 paper francs, and 168,771,745 U.S. dollars. Complete suspension of the foreign debt service was announced Nov. 20, 1937. The exchange value of the paper mil-

reis in 1937 was \$0.0869 in the official market and \$0.0622 in the free market.

Transportation, etc. Railway lines in 1937 extended 20,945 miles; roads, 93,135 miles; airlines, 21,246 miles (1938); navigable waterways, 21,944 miles. A branch railway 103 miles long providing direct service between the port of Santos and Mayrink, center of a rich farming region in southern São Paulo, was opened Dec. 3, 1937. A new air service connecting Rio de Janeiro with Buenos Aires via São Paulo, Curitiba, the Iguassú Falls, and Asunción (Paraguay) was opened by Pan American Airways on Feb. 21, 1938. There were 144,000 automobiles in Brazil in 1937. Rio de Janeiro and Santos are the leading ports. In 1936 a total of 32,503 vessels of 48,272,000 tons entered Brazilian ports.

Government. The "authoritarian" Constitution promulgated Nov. 10, 1937, provided for the dissolution of all political parties and vested greatly increased powers in President Getúlio Dornelles Vargas (see 1937 YEAR BOOK, p. 102 for detailed description). It provided for a bicameral Parliament consisting of an upper chamber (the Federal Council) of 41 members, including one chosen from each State by the State Legislature and 10 appointed by the President, and a lower chamber (Chamber of Deputies) composed of not more than 10 nor less than 3 members from each State, elected by municipal (county) councils. The "corporative organization of national economy" was to be undertaken by a National Economic Council composed of "representatives of the various branches of national production."

President Vargas assumed office Nov. 3, 1930, following the overthrow by military force of the government headed by President Washington Luis Pereira de Sousa. Under the Constitution promulgated July 16, 1934, he was elected constitutional President the following day for a four-year term. The 1937 Constitution increased the presidential term to six years and extended President Vargas's tenure. For developments during 1938, see *History*.

HISTORY

The Vargas Dictatorship. Developments during 1938 banished fears expressed in democratic circles after President Vargas's coup of Nov. 10, 1937, that Brazil had entered the ranks of the totalitarian dictatorships and would substitute close collaboration with Germany and Italy for its traditional friendship with the United States. Instead of this, the year witnessed a steadily widening breach between Brazil and Germany, leading to the virtual severance of diplomatic relations, and a tightening of the economic and political ties between Brazil and the United States.

Yet the ultimate objectives and final form of the Vargas dictatorship remained uncertain. Little if any progress was made during the year in establishing the governmental institutions provided for by the new Constitution. The plebiscite promised by Dr. Vargas to give the nation a chance to ratify or reject the new fundamental law was not held. The regime remained an exclusively personal dictatorship of the President, backed by the armed forces and made possible by the acquiescence of a large proportion of the Brazilian people.

Some steps toward clarification of the constitutional situation were taken early in the year under pressure from the pro-democratic elements among the Vargas supporters, led by Dr. Oswaldo Aranha, influential Ambassador to the United States and organizer of the 1930 revolt that had placed

Dr. Vargas in power. Dr. Aranha had returned to Brazil in December, 1937, to study the new political situation. After lengthy negotiation with the President, he gave his support to the regime by accepting the post of Foreign Minister, effective March 15. He was reported to have first received assurance that a plebiscite would soon be held on the Constitution and that a constitutional convention would be summoned to democratize certain much-criticized sections of that document. Dr. Aranha had also publicly urged the resumption of payments on the foreign debt, suspended since Dec. 15, 1937; elimination of the trade advantages enjoyed by Germany through the use of compensated marks over the United States and other free-currency countries; closer co-operation between the United States and Brazil; and the development of Brazilian natural resources with the aid of foreign and Brazilian capital. It was reported in June that a national political party was being formed with the backing of the armed forces to bolster the Vargas regime and permit the holding of the promised plebiscite. Little progress was made toward this goal during the remainder of the year.

The Fascist Revolt. The major factor behind the postponement of the plebiscite and constitutional convention was the revolt staged by the *Integralistas* (Brazilian Fascists) on May 11. It failed by only a narrow margin to overthrow the Vargas Government and establish a frankly Fascist regime. The *Integralistas*, whose leader, Plinio Salgado, was one of the three candidates for President in the 1937 campaign interrupted by Dr. Vargas's coup, were dissolved as a political party on Nov. 10, 1937, along with all other political groups. It later sought to continue its political activity under the guise of an incorporated cultural and sporting organization. President Vargas moved to frustrate this plan by a decree defining cultural societies as those owning and maintaining establishments suitable to their purpose. Since the *Integralistas* had no such equipment, the movement was partially disorganized. Early in 1938 it split into several groups which continued undercover political activities.

After a series of minor clashes between police and *Integralistas*, in which the police uncovered large arms depots, the government on March 18 announced the frustration of an *Integralista* conspiracy to assassinate President Vargas and other governmental leaders. Salgado and five of his chief aides escaped the police dragnet, but some 600 of his followers were arrested. Despite police vigilance, the radical wing of the *Integralistas* on the early morning of May 11 attempted to seize control of the government through a well-planned effort to kidnap or kill President Vargas and his chief associates and to capture strategic centers within the capital. Simultaneous attacks were made upon Guanabara Palace, the residence of the President, the Navy Ministry, the Naval Arsenal, the Treasury Building, the telegraph and telephone headquarters, and the residences of the Minister of War and the chief of staff of the army. Most of the guard at the Guanabara Palace joined the revolt and only the effective armed resistance offered by the President and his sons and secretaries prevented his capture. Loyal troops soon came to the President's aid and within a few hours the uprising was crushed. More than 20 persons were killed in the fighting.

A more intensive police roundup of *Integralistas* was now begun. In subsequent weeks more than 1000 were arrested, including Belmiro Valverde,

ringleader of the revolt, and a number of prominent army and navy officers, industrialists, professional men, and writers. Additional arms caches were discovered. In a speech on May 13 President Vargas declared that the revolt was planned "with foreign help." The Brazilian press identified German and Italian emissaries in Brazil as the sources of this aid.

Trials of participants in the revolt began in June even before the National Security Court had finished trials of the radicals charged with participation in the Leftist uprising of November, 1935. On June 21 at Recife 160 of these Leftists were sentenced to prison for terms of from one to eight years. Trials of *Integralistas* implicated in the March conspiracy and the May uprising proceeded throughout the remainder of the year. By the end of October about 300 had been sentenced to prison for terms ranging from 3 to 10 years. Many of them were sent to the prison colony on the islands of Fernando de Noronha. On July 28 Plinio Salgado and former Governor José Flores da Cunha of Rio Grande do Sul were indicted for alleged participation in the May rising. Both were reported in exile in Argentina. On October 18, and again on November 3, the police announced that they had nipped in the bud new *Integralista* plots to assassinate high government officials.

Anti-Nazi Measures. Closely connected with the warfare between the *Integralistas* and the government were the measures taken by the Vargas regime to check Nazi and Fascist propaganda and activities among Brazilians of German and Italian origin or descent. A start in this direction was made in 1937 as a result of Brazilian alarm at the success achieved by agents of the German Government in instilling Nazi principles and loyalty to the Reich among German-speaking Brazilians (see 1937 YEAR BOOK, p. 105).

On Feb. 17, 1938, the police in the State of Rio Grande do Sul ordered the dissolution of all Nazi, Fascist, and other political groups affiliated with or working under foreign political direction. On March 29 it was announced that Brazilian educational authorities in Rio Grande do Sul and Santa Catharina had assumed control of German, Italian, and Polish private schools in those States. A decree nationalizing education in Rio Grande do Sul and forbidding the teaching of any language except Portuguese was issued early in April. Foreign governments and associations were forbidden to subsidize schools in the State.

These steps, aimed chiefly at German activities, were followed on April 19 by a decree barring all foreign political propaganda from Brazil. Foreign schools and societies were placed under government supervision and naturalized Brazilians were forbidden to join even those non-political foreign societies that were permitted. In September the head of a German parochial school charged with Nazi propaganda was forced to leave Brazil. Several German schools and colleges charged with continuing anti-Brazilian propaganda were closed. The government also transferred a force of the regular army artillery to the predominantly German city of Blumenau in Santa Catharina.

Naturalization and Immigration Laws. Various other measures of the Vargas regime in both the political and economic fields reflected its strong nationalism. A nationality law of Apr. 25, 1938, provided for the revocation of naturalization for "political and social activities injurious to the national interests." Requisites for naturalization included 10 years' continuous residence in Brazil and

knowledge of the Portuguese language. A decree of April 28 provided for the deportation of foreigners who committed crimes "against the integrity of the state."

The important immigration law of May 4 restricted the number of immigrants of any nationality entering Brazil each year to 2 per cent of the number of persons of that nationality admitted during the 50 years from 1884 to 1933. However, the Immigration and Colonization Council, created to administer the law, was authorized to raise to 3000 persons the annual quotas from countries not entitled to this number under the 2 per cent requirement. The decree further provided that at least 80 per cent of each quota must be "farmers or technicians in rural industries" who could not change their occupation for at least four years after entering the country. To encourage more rapid assimilation of immigrants, the law forbade the establishment of settlements in which foreigners of one nationality comprised more than 25 per cent of the total population. It required elementary education in Portuguese by teachers born in Brazil and prohibited the teaching of a foreign language to children under 14. Foreign language publications might not be printed in rural areas without permission of the Council.

The Immigration Council ruled on September 13 that persons who had entered the country on tourist visas and stayed more than the allotted time and those who had entered the country illegally were subject to deportation. Such persons were given four months from July 30, 1938, to seek legalization of their residence for a longer period, the apparent intent being to decide each case on its merits. The ruling applied to some 5400 foreigners, including 1800 Jewish refugees from Germany, who had entered the country as tourists and remained.

Other Nationalistic Measures. A decree of April 29 nationalized the petroleum industry. The National Petroleum Council was established to regulate all branches of production, importation, transportation, distribution, and sale. All refineries were to be owned and operated by native Brazilians. Companies in operation at the time the decree was issued were given six months to conform. The decree forced the reorganization of Brazilian branches of American companies with an investment of \$30,000,000 in the selling and distribution of petroleum products in Brazil. On August 4 the Brazilian Zionist Federation was banned under the law dissolving all foreign political societies. A decree of August 22 ordered the Brazilian Rotary Clubs to sever their connection with Rotary International. On October 22 President Vargas instructed his Finance Minister to proceed with the nationalization of foreign banks and insurance companies, as required by the new Constitution. On the other hand, the government liberalized its restriction upon the employment of foreign capital in mining enterprises.

A number of other laws decreed during the year tended to centralize political and economic control at Rio de Janeiro. A Labor Day decree, effective May 2, established minimum wages for workers, including farm hands and domestic servants. Consumption taxes on domestic and imported products were sharply increased on February 24, thus permitting a start toward gradual elimination of interstate export taxes, provided for in the decree law of April 18. A National Maté Institute was created by the decree-law of April 13 to co-ordinate and supervise the production, sale, and advertising

of maté. In April President Vargas announced that the government would build national packing plants to supply the meat needs of Brazil, which he said were neglected by the foreign-owned *frigoríficos* interested chiefly in export markets.

Although the abandonment of the seven-year-old coffee stabilization program had been announced Nov. 10, 1937, the National Coffee Department during 1938 continued to destroy surplus coffee stocks, to compensate the growers, and to regulate exportation.

Foreign Relations. A diplomatic break between Brazil and Germany that greatly handicapped the Reich in its drive for trade supremacy in Brazil was the major development in the country's foreign relations during 1938. Germany had ousted the United States as the principal supplier of Brazilian imports in 1936 as a result of the compensated mark system of bartering German manufactures for Brazilian raw materials. In 1937 the Reich increased its lead, and with the development of Brazilian economic dependence upon Germany Nazi propaganda there became more and more bold.

A reversal of this situation set in early in 1938 as a result of the Brazilian restrictions on Nazi propaganda, the arrest of nine German citizens charged with complicity in the May revolt against the Vargas Government, and the uncovering of evidence by Brazilian police pointing to the German Government as a supporter of the *Integralista* movement. These developments led to severe recriminations between the German and Brazilian press and a steadily growing coolness in official relations. German representations against the repression of "cultural" activities among German-speaking elements in Brazil were curtly rejected in March by the Brazilian Foreign Office, which was angered by Chancellor Hitler's proclamation of a protectorate over German minorities abroad in his Reichstag speech of February 20.

The German-Brazilian hostility aroused in connection with the *Integralista* revolt in May was followed by Brazil's suspension of cotton exports to Germany on a compensated basis on June 3 and Germany's termination of all purchases from Brazil on July 12. This trade war was ended on July 22, when the Bank of Brazil resumed purchases of German compensation marks. However, the Bank prohibited further purchases in such marks of cotton and cacao, two products which Germany had formerly bought on a large scale. The net result of these difficulties was that the United States again outdistanced Germany in the Brazilian market.

Meanwhile German-Brazilian diplomatic friction had increased. On October 15 the Brazilian Government bluntly informed Berlin that it did not desire the return to Rio de Janeiro of Dr. Karl Ritter, the German Ambassador, who had been on an extended vacation in Germany. The Reich Government immediately demanded the recall of the Brazilian Ambassador from Berlin. The German press angrily charged the United States with plotting to disturb German-Brazilian relations.

The fear that Germany had designs upon the southern States of Brazil with their large German populations and the satisfactory state of Brazilian-United States trade relations led the Brazilian Government into closer political and economic relations with the North American republic. These ties of friendship were drawn closer by the appointment of a mixed Brazilian-American trade committee in January, the inauguration in October of

improved shipping services to the east coast of South America by the U.S. Maritime Commission's "Good Neighbor Fleet," and various other developments.

Brazil also tightened its ties of friendship with the other American republics. The Argentine and Chilean Foreign Ministers visited Rio de Janeiro in April and May, respectively, and their close collaboration in the solution of inter-American problems was strengthened. The termination of the Chaco dispute between Bolivia and Paraguay followed on July 21, eliminating a fertile source of dissension among the American republics (see CHACO DISPUTE, SETTLEMENT OF). New treaties signed with Bolivia provided for joint Bolivian-Brazilian development of petroleum deposits and construction of railways in Eastern Bolivia (see BOLIVIA under *History*). A mixed Brazilian-Paraguayan commission developed plans for closer economic ties and political relations. The three-year task of marking the boundary between Brazil and Surinam was completed May 3 by a mixed Brazilian-Dutch technical commission. On November 9 it was announced that Brazil and Colombia would raise their legations in Bogotá and Rio de Janeiro, respectively, to the rank of embassies.

Brazil and Venezuela took the same step on December 9. A treaty of non-aggression, conciliation, and arbitration was signed by Brazil and Venezuela on December 7.

See ARGENTINA and PARAGUAY under *History*; PAN AMERICAN CONFERENCE.

BREMEN. See GERMANY.

BRETHREN, CHURCH OF THE. A church established in 1719 at Germantown, Pa. It originated at Schwarzenau, Germany, in 1708, and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or Dunkers. Other churches of the group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh Day Baptists; and Old Order German Baptist Brethren.

There were on Sept. 30, 1938, in the 49 district conferences of the United States and Canada, 1344 churchhouses, of which 218 were in cities and 1126 in small towns and rural districts. These churchhouses represented 1024 congregations. The total membership was 169,571. Foreign mission work was carried on in India, China, and Africa. The church membership in India was 6054; in China 2361; and in Africa 448.

The denomination supported the following colleges: Bridgewater in Bridgewater, Va.; Elizabethtown in Elizabethtown, Pa.; Juniata in Huntingdon, Pa.; Manchester in North Manchester, Ind.; McPherson in McPherson, Kans.; and La Verne in La Verne, Calif. Bethany Biblical Seminary was located in Chicago. The *Gospel Messenger* was the official church paper.

The officers presiding at the 1938 general conference were: Dr. V. S. Schwalm, moderator; the Rev. James M. Moore, reader; the Rev. J. E. Miller, secretary. The moderator-elect for 1938 was Dr. D. W. Kurtz. The conference, which was held at Lawrence, Kans., June 8-15, gave considerable time to the 200th anniversary of the founding of the Sower Press, established in Philadelphia in 1738, which printed in 1743 the first Bible printed in America in a European language and which yielded a wide influence in the colonies for nearly half a century. The 1939 conference will meet at Anderson, Ind., June 7-13.

Headquarters of the four general boards of the

church—mission, Christian education, ministerial, and general education—and of the Brethren Publishing House are in Elgin, Ill.

BRIDGES. In response to the demands of modern highway traffic, the center of activity not only shifted from railway- to highway-bridge building after the World War, but the States, pressed for highway funds, were, apparently, glad to have private interests undertake toll-bridge constructions. This movement reached its peak just before the depression and was followed by a marked trend toward public constructions, usually of the commission or authority type (see 1929 and 1930 YEAR BOOKS). This movement has been accelerated in recent years, particularly through the use of PWA funds, and today, publicly owned PWA highway bridges constitute almost the entire activity in American bridge building.

Bridge Openings. Among the notable bridge openings of the year, the dedication on August 6 of the bridge over the Connecticut River, between Middletown and Portland, Conn., should be noted. The two 600-ft. tied steel arches of this new higher-level crossing were erected by an unusual and daring plan of cantilevering the two halves of the arches from the center pier through the use of a temporary tie-link and tie-back cables, balancing the construction on each side of the pier with the aid of a single supporting bent.

Another notable opening was that of the multiple cantilever over the Ohio River at Cairo on July 1. This highway bridge, with a 20-ft. roadway, consists of three main spans, two of 600 ft. each and a third of 800 ft., the latter being the only one to carry a suspended span between the cantilever arms.

On October 8 a new international bridge, the Blue Water, a flat-arch cantilever with a main span of 871 ft., was opened between Port Huron, Mich., and Sarnia, Ont., at the south end of Lake Huron. This bridge is very similar in general form to the high-level bridge over the Neches River in northeast Texas which was opened in March. The latter, however, has the remarkable clearance of 230 ft. (against 150 ft. for Blue Water) and was specially designed for hurricane wind loads.

Special ceremonies marked the dedication on August 18 of the Thousand Islands Bridge which provides an international crossing over the St. Lawrence in the Alexandria Bay area, north of Watertown, N. Y. This project actually involves several bridges, spanning from island to island, including an 800-ft. suspension span on the American side and a 750-ft. span on the Canadian.

A notable suspension span, the Lions Gate Bridge over the First Narrows at Vancouver, was opened in November. This \$6,000,000 structure has a main span of 1550 ft.

New York. A second deck was added to the Henry Hudson arch over Spuyten Duyvil, on the new West Side Parkway extension, to take care of the rapid increase in traffic on this recently completed structure.

The opening of a new roadway on the Queensborough cantilever at 59th St. marks the completion of a program for modernizing the floor systems of the East River bridges so as to provide both improved roadway surfaces and to reduce dead loads, thereby increasing load capacities.

In the extension of the West Side elevated highway below Canal St., a remarkable "dry-land" arch has also been built. In order to avoid the Holland tunnels and a sewage-screening plant, the highway was carried over Canal St., with a 360-ft.,

two-hinged tied arch—one of the largest bridges ever built over dry land.

Still another bridge operation in the New York area was that of providing new approaches at the Manhattan end of the great George Washington suspension bridge as well as encasing the huge but ugly anchorage in a granite facing.

The Whitestone suspension, to connect the Bronx and Long Island, has reached the floor erection stage, with every effort being made to open the structure in mid-summer of 1939 for the World's Fair.

Concrete Bridges. European engineers have frequently employed hollow, or cellular, construction in reinforced concrete bridges, but American engineers have generally found it more economical, with our higher labor costs, to use solid sections. The recent completion of a three-span, two-lane, highway bridge over an arm of Puget Sound at Purdy, Wash., however, marks the appearance of this type of construction in America. The three spans of this bridge consist of a continuous hollow girder of 190-ft. central and 140-ft. side spans. The 20-ft. roadway is carried by three vertical ribs, with a pleasing, curved lower chord, which form two longitudinal cells and are braced transversely by diaphragms at intervals of about 20 ft. Interior forms for the cells were removed before pouring the deck.

A high-level, concrete-arch viaduct over the Little Miami River at Foster's Crossing, Ohio (on route Columbus-Cincinnati), also deserves a note. Although not of remarkable size, this viaduct is on a grade of 2 per cent and, in order to maintain similar arch forms in the interest of appearances, a constant ratio of rise to span required different spans (155–175 ft.) for each of its six arches. Unable to use centering over again for successive arches, the contractor resorted to the plan of building unusual trussed-timber arched ribs to support the two concrete ribs of each arch during construction.

Probably the most unique bridge project ever proposed is that to span Lake Washington with a concrete pontoon bridge near Seattle. Reinforced concrete pontoons, each 59 by 350 ft. in size, are to be used, with a 200-ft. draw span provided by a pontoon which is to slide into a slot between the two traffic lanes. PWA funds have been made available for this work but the first bids for construction proved to exceed estimates and were rejected.

The proposed use of an incomplete railway in Pennsylvania (see TUNNELS) and the reconstruction of the famous Key West railroad in Florida indicate a probable use for some of our branch railroad lines as these are abandoned for lack of traffic and other reasons. Connecting the tip of Florida with the mainland, the Key West Railway was badly wrecked by the hurricane of 1935. After reconstructing some 11 bridges, so as to provide a 20-ft. roadway, and hardsurfacing the line throughout, at a cost of \$3,500,000, this line was opened as a highway toll road on March 29.

Golden Gate Bridge. Two experiences at the great Golden Gate suspension bridge (longest span in the world, 4200 ft.) are of interest. In an attempt to determine the effect of a reduction in tolls, a temporary cut from 50 to 25 cents was made during the summer. While there was a marked increase in volume of traffic it was not clearly demonstrated that this was due to the cut in tolls and it was insufficient to overcome the reduction. The older practice was, therefore, resumed, although the volume of traffic fails to meet costs.

The other item has to do with the tremendous

effect of lateral wind loads on suspension structures. A wind, recorded at a nearby station at 78 m.p.h., caused a lateral deflection in the Golden Gate Bridge estimated by one of the engineers to have been as much as 8 ft. Waves, or ripples, passed over the floor system with changes in the wind and the twin suspender cables (15-in. centers) were slapped one against the other.

Failures. The collapse on March 14 of the 245-ft. welded Vierendeel-type truss bridge over the Albert Canal, near Hasselt, Belgium, led to some questioning of the adequacy of recent welded construction. It appears that European designers have used very thick plates on such structures and that the welding is probably inadequate to develop the full strength of such plates. On this bridge, plates $2\frac{1}{8}$ in. thick were used in the flanges (plates as much as $3\frac{1}{2}$ in. have been used in Germany), but the failure in this case appears to have been due to the poor, brittle character of the steel employed.

During early January the public was advised that unusual ice jams in the Niagara Gorge, just below the Falls, were threatening the supports of the famous Falls' View International Bridge. This 840-ft. steel arch was, when completed in 1898, the largest arch span in the world. The great bridge literally died by inches and finally collapsed on the 27th. Plans are already under way to replace the structure, probably with another arch, but with the abutments well above maximum ice levels.

The Narrows Bridge, TACOMA. The Washington Toll Bridge Authority opened bids in September for a \$6,000,000 suspension bridge across the Narrows in Puget Sound near Tacoma. This bridge, although a light highway construction with 26-ft. roadway, will be a notable addition to American suspension structures with a main span of 2600 ft., and with side spans of unusual length—1300 ft. each. The contract was awarded in November.

BRIGHAM YOUNG UNIVERSITY. A coeducational institution in Provo, Utah, founded in 1875 and maintained under the auspices of the Church of Jesus Christ of Latter-day Saints. In the 1938 summer session 820 students were enrolled; the autumn session enrollment was 2292. The faculty numbered 150 members. The library contained 109,000 volumes. The budget for the year was \$413,000. A women's dormitory was erected at a cost of \$100,000 and 15 acres of land were added to the campus in 1938. President, Franklin Stewart Harris, Ph.D.

BRISTOL PEACE CONFERENCE. See PEACE.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. An association founded in York, England, in 1831, and incorporated by Royal Charter in 1928, for the purpose of fostering the interests of workers in all branches of science, and to give a stronger impulse to scientific research, both theoretical and practical.

The 108th annual meeting was held in Cambridge, England, Aug. 17–24, 1938, under the presidency of the Rt. Hon. Lord Rayleigh, who opened the session with an address entitled "Vision in Nature and Vision Aided by Science." At this meeting, the General Committee adopted the proposal for the substitution of a quarterly publication for the annual volume hitherto issued.

The addresses delivered by the sectional presidents included: "Logic and Probability in Physics," by Dr. C. G. Darwin (mathematical and physical sciences); "Recent Investigations in the Chemistry of Gold," by Prof. Charles S. Gibson (chemistry); "Development and Evolution," by Prof. H. H.

Swinnerton (geology); "Oceanography and the Fluctuations in the Abundance of Marine Animals," by Stanley Kemp (zoology); "Correlations and Culture," by Prof. Griffith Taylor (geography); "Scope and Method of Economics," by R. F. Harrod (economic science and statistics); "The Changing Outlook of Engineering Science," by Prof. R. V. Southwell (engineering); "The Orient and Europe," by Prof. V. G. Childe (anthropology); "Eye and Brain as Factors in Visual Perception," by R. H. Thouless (psychology); "The General Physiology of the Plant Cell and Its Importance in Pure and Applied Botany," by Prof. W. Stiles (botany); "The Function of Administration in Public Education," by J. Sargent (educational science); "Ley-Farming and a Long-Term Agricultural Policy," by Prof. R. G. Stapledon (agriculture).

Sir Albert Seward was elected president to succeed Lord Rayleigh, and Dundee, Scotland, was selected as the site of the 1939 meeting, to be held August 30-September 6. The secretary was O. J. R. Howarth, and the headquarters of the Association were at Burlington House, London, England.

BRITISH CAMEROONS. See CAMEROONS, BRITISH.

BRITISH COLUMBIA. The most westerly province of Canada. Area, 366,255 square miles (exclusive of salt-water area); population (1938 estimate), 761,000 compared with 694,263 (1931 census). During 1936 there were 15,786 births, 5451 marriages, and 7222 deaths. Chief towns (with 1931 census figures): Vancouver, 246,593; Victoria (capital), 39,082; New Westminster, 17,524; North Vancouver, 8510; Trail, 7573; Nanaimo, 6745; Prince Rupert, 6350; Kamloops, 6167. The primary and secondary schools had 117,073 students enrolled (1935-36); the university of British Columbia had 1383 students and Victoria College, 213.

Production. The gross agricultural revenue for 1937 totaled \$45,025,000, of which field crops from 487,700 acres accounted for \$16,592,500. In 1936 gross agricultural revenue was estimated at \$41,869,000 (field crops, \$15,891,000; fruits and vegetables, \$8,484,000; dairy products, \$8,245,000; poultry and eggs, \$4,412,000; farm animals, \$3,808,000). Livestock in the province (1937): 333,800 cattle, 183,200 sheep, 62,090 horses, 55,700 swine. Fur production (1935-36) was 194,596 pelts valued at \$1,201,523. The forest production (1937) was equivalent to 670,948 M cu. ft. valued at \$32,734,704. In 1937 the value of the fisheries catch was \$16,155,439.

Mineral production (1937) was valued at \$75,555,798, which included gold (505,857 fine oz.), \$17,799,936 including exchange equalization; lead (403,589,913 lb.), \$20,623,445; zinc (287,192,877 lb.), \$14,078,195; copper (45,797,988 lb.), \$5,989,461; silver (11,530,177 fine oz.), \$5,174,859; coal (1,598,843 tons), \$5,863,849. During 1936 the 1695 manufacturing plants (including those in the Yukon), with 39,796 employees, produced goods valued at \$87,780,346 net.

Finance. For the fiscal year ended Mar. 31, 1938, revenue amounted to \$31,036,942; expenditure, \$27,672,043. On Oct. 31, 1937, the net provincial debt totaled \$151,162,657.

Government. Executive power is vested in a lieutenant-governor (appointed by the Canadian governor general in council), assisted by a ministry of 9 members which is responsible to the legislative assembly of 48 members elected by popular vote of the people. At the provincial election of June 1, 1937, 31 Liberals, 8 Conservatives, 7 Co-

operative Commonwealth Federationists, 1 Labor, and 1 Independent were elected to the legislative assembly. In the Dominion parliament at Ottawa, the province is represented by 6 Senators and 16 members in the House of Commons. Lieutenant-Governor, Eric W. Hamber (appointed May 1, 1936); Premier, T. D. Pattullo (Liberal).

History. During the year 1938, a scheme was being considered for the construction of a highway (known as the "Alaska Highway") from the border of the State of Washington, through British Columbia and the Yukon, and to Fairbanks in Alaska. Mr. Pattullo, the Premier of British Columbia, stressed the value of such a road as a tourist attraction to the province.

During July, great fires were raging in the forests along the east coast of Vancouver Island. The fishing resort of Forbes Landing was destroyed and there was a considerable loss of standing timber and young second growth. See CANADA under *History*.

BRITISH COMMONWEALTH OF NATIONS. A commonwealth comprising (1) the British Empire (GREAT BRITAIN and NORTHERN IRELAND, Channel Islands, Isle of Man, INDIA, BURMA, and the various British colonies, protectorates, and dependencies) and (2) the Dominions (CANADA, AUSTRALIA, NEW ZEALAND, SOUTH AFRICA, and IRELAND). Including the British mandated areas of CAMEROONS, NEW GUINEA, PALESTINE, NAURU, SOUTH-WEST AFRICA, TANGANYIKA, TOGOLAND, and WESTERN SAMOA, the British Commonwealth of Nations had a total area of 13,355,426 square miles and a total estimated population of 500,774,000. Consult the separate articles.

BRITISH EAST AFRICA. See KENYA, TANGANYIKA, and UGANDA.

BRITISH GUIANA, gè-a'na. A British colony in northern South America. Area, 89,480 square miles; population (Jan. 1, 1938), estimated at 387,039 including 142,978 East Indian immigrants. The birth rate was 33.3, and the death rate 21.9 per 1000 of the population in 1937. In the interior there are some 8797 aboriginal Indians living in their primitive state.

Production and Trade. Sugar, rice, gold, diamonds, rum, coconuts, timber, bauxite, balata, and coffee are the principal products. Livestock in the colony (1936): 131,637 cattle, 26,310 sheep, 22,480 swine, 11,321 goats, 5962 donkeys, and 2817 horses. There are important local manufactures of matches, cigarettes, boots and shoes, and edible oil. In 1937 imports were valued at \$11,496,496; exports, \$13,128,774, of which the chief items were sugar (181,569 tons), \$7,607,680; bauxite (300,707 tons), \$1,719,984; gold (39,047 oz.), \$1,012,913; rice (18,545 tons), \$773,412; rum (1,235,056 gal.), \$297,226. Great Britain supplied \$6,165,166 of the imports and took \$4,907,844 of the exports; Canada sent \$1,690,101 of the imports and received \$5,881,714 of the exports. British Guiana's sugar-export quota for 1938-39 was fixed at 166,700 long tons. The number of tourists visiting the colony in 1937 totaled 3434.

Government. For 1937 revenue amounted to £1,374,133; expenditure, £1,274,300; public debt, £4,525,685. Budget (1939): revenue, \$5,408,342; expenditure, \$6,363,581. The British Guiana (Constitution) Order in Council, 1928 (amended in 1935) provided for the government of the colony and for the constitution of a legislative council consisting of the governor as president, 10 official members, and 19 unofficial members. Executive and administrative functions rested with the governor and

the executive council. Governor, Sir W. E. F. Jackson (appointed Jan. 19, 1937).

History. In January, 1938, it was reported by the Terry-Holden Expedition that a huge meteor had crashed into the Marudi Mountain, Rupununi, cutting a path 30 miles long and devastating a wide area. A factory to manufacture bricks, drainage, and roofing tiles, and pipes was erected in La Penitence, near Georgetown, during the year. British Guiana sent a representative to the Inter-Colonial customs conference which met on Jan. 31, 1938, at Jamaica to discuss uniform customs procedure. The British Royal Engineers, sent out to demarcate the boundary between Brazil and British Guiana, completed their work in October. In February of 1939 the West Indies Royal Commission was expected to visit British Guiana. See JAMAICA under *History*.

BRITISH HONDURAS, hōn-dōō'ras. A British crown colony in Central America. Area, 8598 square miles; population (Dec. 31, 1937, estimate), 56,893. Belize, the capital, had 16,687 inhabitants in 1931. During 1937 there were 1876 births, 1054 deaths, and 467 marriages.

Production and Trade. Mahogany, cedar, logwood, rosewood, banak, pine, chicle, bananas, coconuts, citrus fruits, plantains, sugar, and rice are the main products. The export of bananas in 1937 totaled 938,985 bunches, valued at \$330,491. In 1937 total imports were valued at \$3,981,249; total exports, \$2,602,600.

Education. In 1937 there were 78 schools with 9059 pupils which were aided by the Government, and 4 private schools for secondary education, conducted by religious denominations, with a total of 456 students.

Communications. The weekly air-mail and passenger service through Mexico and Miami, Florida, was discontinued in 1938. There is a weekly air-mail and passenger service between Belize and points in Honduras and Guatemala. In 1937 there were 149 miles of roads.

Government. For 1937 revenue totaled \$1,188,536 (excluding loan-in-aid from Imperial funds of \$36,675 and payments from the Colonial Development and Loan Funds of \$360,104); expenditure, \$1,187,364 (excluding \$378,421 for Colonial Development Fund grants and Loan Works). Revenue for 1938 was estimated at \$1,091,299; expenditure, \$1,271,443. The colony is administered by a governor, aided by an executive council of 6 members and a legislative council of 13 members. Governor and Commander-in-Chief, Sir Alan C. M. Burns (appointed, May 18, 1934).

BRITISH MALAYA. A geographical term for the Federated Malay States, Straits Settlements including dependencies, and Unfederated Malay States (see the separate articles). The term should, strictly speaking, include British North Borneo, Brunei, and Sarawak, but these possessions in Borneo are not included in the statistics of this article. Total area, 51,977 square miles; population (1937 estimate), 5,107,339.

Production and Trade. The principal products are rubber, tin, copra, pineapples, coconut oil, palm oil, sugar, rice, areca nuts, timber, gold, and resin. In 1937 imports were valued at \$5692,165,000; exports, \$5902,878,000 (Straits dollar averaged \$0.5797 for 1937). British Malaya, in 1937, produced 41.4 per cent of the world's rubber. During 1937 a total of 26,890 fishermen, using 10,679 boats, landed 88,530 tons of fish (valued at \$9,605,000) in British Malaya.

History. The Straits Settlements legislative

council passed the currency ordinance providing for a currency commission to be set up to introduce an all-Malayan currency instead of the Straits Settlements currency now in use throughout British Malaya. Royal Netherlands Airways completed negotiations for an air service between Singapore and Saigon. Imperial airways inaugurated, using flying boats, a tri-weekly air mail between Malaya and Great Britain.

BRITISH NEW GUINEA. The former name of PAPUA, TERRITORY OF (q.v.).

BRITISH NORTH BORNEO. A state in northern Borneo, under British protection. Area, 31,106 square miles; population (1936 estimate), 291,000. Chief towns: Sandakan (capital), 13,826 inhabitants in 1931; Jesselton.

Production and Trade. Rubber, timber, sago, rice, coconuts, gums, coffee, and tobacco are the main products. In 1937 imports were valued at \$56,361,937 (1936, \$54,804,668); exports, \$514,295,287 (1936, \$58,985,766). The Straits dollar (\$S) averaged \$0.5797 (U.S.) for 1937. A railway runs from Jesselton (the chief port on the west coast) to Beaufort (the center of the rubber industry) where it runs inland to Melalap. In 1937 there were 244 miles of roads.

Government. For 1936 revenue amounted to £341,586; expenditure, £203,148. The country is under the jurisdiction of the British North Borneo (Chartered) Company. It is administered by a governor (approved by the British Secretary of State for the Colonies) in Borneo, and a court of directors in London. Governor and Commander-in-Chief, C. R. Smith (appointed, July 17, 1937).

BRITISH SOLOMON ISLANDS PROTECTORATE. See SOLOMON ISLANDS, BRITISH.

BRITISH SOMALILAND. See SOMALILAND, BRITISH.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, UNION OF.

BRITISH WEST AFRICA. The British territories in West Africa. See CAMEROONS, BRITISH; GAMBIA; GOLD COAST; NIGERIA; SIERRA LEONE.

BRITISH WEST INDIES. The possessions of Great Britain in the West Indies consisting of (1) BAHAMAS, (2) BARBADOS, (3) JAMAICA with Turks Islands, (4) LEEWARD ISLANDS, (5) TRINIDAD AND TOBAGO, (6) WINDWARD ISLANDS. Consult the separate articles.

BROOKINGS INSTITUTION. An organization devoted to public service through research and training in the social sciences. Established in Washington, D. C., in 1927, it maintains as operating units the Institute of Economics, the Institute for Government Research, and a division of training in which only those who have had at least two years of graduate work are accepted as research fellows.

In carrying out its purpose to aid constructively in the development of sound national policies without regard to the special interests of any group, whether political, social, or economic, the Institution conducted during 1938 several significant investigations. The resulting studies were published under the following titles: *Industrial Price Policies and Economic Progress*; *America's Stake in International Investments*; *The Income Structure of the United States*.

The Institution is supported from endowment funds and annual grants. The officers of the board of trustees for 1938-39 were: Chairman, Dwight F. Davis; vice chairman, Leo S. Rowe; president,

Harold G. Moulton; treasurer, Henry P. Seidemann; and secretary, Elizabeth H. Wilson. Headquarters are at 722 Jackson Place, Washington, D. C.

BROOKLYN COLLEGE. A coeducational institution of higher education in Brooklyn, N. Y., founded in 1930 as one of the four institutions of higher learning, supported by municipal taxes and administered by the Board of Higher Education. The others are Hunter College, Queens College, and the City College. The enrollment for the autumn of 1938 was 13,440, of whom 6214 were in the Day Session, 5985 in the Evening Session, 612 in the Division of Courses for Teachers, and 629 in the Graduate Division. The 1938 summer session had an attendance of 3519. The faculty numbered 501 including 56 additions. The budgetary allowance for 1938 was \$1,925,424. There were 150,000 volumes and 406 periodicals in the library. Brooklyn College moved into its new quarters at Bedford Avenue and Avenue H in October. There are five buildings which will accommodate 7500 students in the day and 7500 in the evening. The cost is \$5,500,000 financed by a PWA loan and grant. The site of 42 acres cost \$1,600,000. President, William A. Boylan (resigned Sept. 19, 1938); Acting President, Mario E. Cosenza.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. One of America's oldest and largest institutions for informal education, located in Brooklyn, N. Y. Its public activities are conducted at four centers: The Institute at the Academy of Music, the Central Museum, the Children's Museum, and the Botanic Garden. Founded in 1824, the Institute was incorporated in its present form in 1890. Total membership is about 8000 and is open to everyone.

The Institute at the Academy of Music presents an annual program of concerts, lectures, forums, and classes of instruction in every major field of the arts and sciences. Attendance at these events for the season 1937-38 totaled 246,199. The Institute's Museums possess collections in art, ethnology, and natural science. The Central Museum reference library contains more than 27,000 volumes as well as many pamphlets and complete sets of rare periodicals. It includes the Steward Culin Library on Ethnology and the Charles Edwin Wilbour Library on Egyptology. Attendance at both Museums for the year 1938 totaled 817,841. The Institute's Botanic Garden comprises more than 50 acres and plant houses containing tropical and sub-tropical species. The Botanic Garden reference library has over 25,000 volumes and pamphlets. Botanic Garden attendance for the year 1938 totaled 1,628,444.

In 1938 the permanent funds of the Institute amounted to \$4,438,038 and the funds to meet current expenses, to \$934,131. Under a general reorganization plan adopted in April, 1938, James G. McDonald was named president of the Institute. Other officers are: Edward C. Blum, chairman of the board of trustees; Irene Miles, acting director of the Institute at the Academy of Music; Laurance P. Roberts, director of the Museums; Mrs. William Lloyd Garrison, 3d, curator-in-chief of the Children's Museum; C. Stuart Gager, director of the Botanic Garden. Executive offices are located in the Academy of Music, 30 Lafayette Avenue, Brooklyn.

BROWN, ERNEST WILLIAM. An American mathematician, died in New Haven, Conn., July 22, 1938. Born in Hull, England, Nov. 29, 1866, he was educated at Christ's College, Cambridge (A.B., 1887; A.M., 1891; Ph.D., 1897) and held a fellowship there from 1889 to 1895. In 1891 he came to

the United States as an instructor in mathematics at Haverford College, becoming professor of applied mathematics in 1893, and professor of mathematics in 1900. He joined the faculty of Yale University in 1907 as Josiah Willard Gibbs professor of mathematics, and in 1932 was retired with the title emeritus.

One of the world's leading mathematicians and an authority on the motions of the moon, Dr. Brown's researches dealt chiefly with the new lunar theory and tables, the evolution of nebulae and the solar system, the planetary theory, and measures of time. In his studies of the moon, he passed 30 years determining its orbit and his calculations, which included mapping the moon's course for several hundred years, resulted in *Yale Tables of the Moon's Motion* (1920), which are used in computing the nautical almanacs of different countries.

Many honors came to this brilliant scientist, including the Royal Astronomical Society gold medal (1907), the Pontécoulant prize, Paris Academy of Science (1910); a fellowship in (1898) and the Royal medal (1914) of the Royal Society of England for his investigation in astronomy, chiefly in lunar theory; the Bruce gold medal of the Pacific Astronomical Association (1920), and the Watson medal of the National Academy of Sciences (1937), given in recognition of his outstanding contributions to astronomical science, mainly in the field of gravitational theory in the solar system.

Dr. Brown was president of the American Mathematical Society (1914-16) and edited its *Transactions* (1900-07) and *Bulletin* (1910-12). Also president of the American Astronomical Society (1928-31) he served as associate editor of its *Journal* from 1911. In addition to many papers on the lunar theory and on celestial and general mechanics, his published works included *Treatise on the Lunar Theory* (1896); *A New Theory of the Moon's Motion* (1897-1905); *The Inequalities in the Motion of the Moon Due to the Direct Action of the Planets* (1908), and *Planetary Theory*, with C. A. Shook (1923).

BROWN UNIVERSITY. An institution of higher education in Providence, Rhode Island, founded in 1764; it has three major subdivisions: The College, for undergraduate men; Pembroke College for undergraduate women; and the Graduate School. The College includes a division of engineering. The enrollment in the autumn of 1938 was 1387 undergraduate men, 489 undergraduate women, and 330 graduate students. The faculty consisted of 254 members. The productive fund of the University on June 30, 1938, was \$11,628,000. Income for the year ending June 30, 1938, was \$1,768,000. Gifts and bequests during the academic year amounted to \$450,021. The libraries contained approximately 536,000 volumes. During 1938 a Chemical Research Laboratory, the gift of Jesse H. Metcalf, was completed, and the University revised its requirements for degrees, to be effective in September, 1939, so that the standard year's work consists of four courses instead of five. President, Henry Merritt Wriston, Ph.D., Litt.D.

BRUCellosis, PATHOLOGY OF. See MEDICINE AND SURGERY.

BRUNEI, brōō-nī'. A native state in northern Borneo, under British protection. Area, 2280 square miles; population (Dec. 31, 1937), 35,963 as against 30,135 (1931 census). Brunei, the capital and chief port, had 10,453 inhabitants in 1931. During 1937 there were 1472 births and 772 deaths.

Crude oil, rubber, cutch, natural gas, and jelutong are the main products. In 1937 imports

were valued at \$2,516,154; exports, \$5,553,428, of which crude oil (550,247 tons) represented \$3,873,959 and plantation rubber (3,964,191 lb.) \$1,240,995; revenue totaled \$1,049,293; expenditure, \$865,149 (Straits dollar averaged \$0.5797 for 1937). The State is ruled by a sultan, subject to the advice of a British Resident who has charge of the administration of government. Sultan, Ahmed Tajudin Akhazul Khairi Wadin (succeeded, 1924); High Commissioner, the Governor of the Straits Settlements; British Resident, J. Graham Black (assumed office, January, 1937).

BRUNSWICK. See GERMANY.

BRYN MAWR COLLEGE. An institution for the higher education of women in Bryn Mawr, Pa., founded in 1885. The enrollment for the autumn of 1938 totaled 598. The teaching staff numbered 97. The productive funds of the college amounted to \$6,415,000, and the receipts for the year 1937-38 were \$871,000. The Library contained 158,000 volumes. President, Marion Edwards Park, Ph.D., LL.D.

BUCHANAN DAM. See FLOOD CONTROL.

BUCKNELL UNIVERSITY. A coeducational Baptist institution of higher learning in Lewisburg, Pa., founded in 1846 under the name of the University of Lewisburg but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1938 the enrollment was 1324, of whom 866 were men and 458 women. At the junior branch in Wilkes-Barre, Pa., there were 207 students. There were 553 students enrolled in the summer session of 1938. The faculty numbered 78. The productive funds amounted to \$1,381,373; the income for the year was \$867,560, and the benefactions received were \$324,295. The library contained 77,000 volumes. A fourth unit of the 12-year endowment and building program was erected in 1938 through gifts from alumni and friends. The first unit of a \$500,000 gymnasium was built in 1938, and construction was begun on a \$275,000 addition to the Engineering Building. President, Arnaud C. Marts, appointed in April, 1938.

BUCKWHEAT. Estimates by the U.S. Department of Agriculture placed the 1938 production at 6,682,000 bu. harvested on 453,000 acres as compared with 8,569,000 bu. and 542,000 acres, the average for the 10 years 1927-36. The yield per acre in 1938 was 14.8 bu. and the 10-year average 15.9 bu. Of the 22 States reporting production, New York ranked first with 2,496,000 bu. and Pennsylvania second with 2,170,000 bu. These yields are about 37 per cent and 32 per cent respectively of the country's total yield. The average yield per acre was 15.5 bu. in both States. Usually about 58 per cent of the total acreage is grown in these two States. The States ranking next and their yields were reported as follows: West Virginia 256,000 bu., Michigan 243,000 bu., and Ohio 210,000 bu., with acreages of 16,000, 18,000, and 14,000 acres, respectively. The buckwheat acreage in 1938 was only about 60 per cent of the acreage 20 years ago. The average yield per acre in the 22 States ranged from 7 bu. in North and South Dakota to 20 bu. in Maryland.

During the fiscal year ended June 30, 1938, the United States exported 379,000 bu. of buckwheat and imported 72,000 lb. as compared with 1000 bu. and 6,809,000 lb. respectively in the fiscal year 1937.

BUFFALO, THE UNIVERSITY OF. A coeducational institution of higher learning in Buffalo, N. Y., founded in 1846. The enrollment in the various schools for the autumn of 1938 was: Full-

time students, 1689; part-time students, 3256. The enrollment for the 1938 summer session was 828. The faculty numbered 708. The endowment fund totaled \$5,740,353, and the income for the year (1937-38) was \$1,037,410. The libraries contained 140,177 volumes and 97,071 pamphlets. The Irwin B. Clark Memorial Gymnasium was expected to be completed. Chancellor, Samuel P. Capen, Ph.D.

BUILDING. Construction contracts for buildings in 37 Eastern States of the United States in 1938, were estimated at \$2,050,000,000 by the F. W. Dodge Corporation, which is 1 per cent less than the actual 1937 figure of \$2,061,454,000. Breaking down the 1938 total, the non-residential buildings are estimated at \$1,065,000,000 or 8 per cent under the 1937, and the residential, including apartments, hotels, and one and two family houses, are estimated at \$985,000,000 or 9 per cent more than 1937. The figures just given do not include repair and maintenance contracts. Slum sections of many cities were cleared, and there were erected apartment houses, where apartments of 2, 3, and 4 rooms could be obtained at nominal rents. In the suburbs, there have been developments of small low-priced houses of 4, 5, and 6 rooms. Both apartment houses and suburban developments were generally partly financed by Federal funds. As to 1939, many expansion and plant-extension programs, deferred in 1938, are likely to be encouraged by renewed business optimism. The Federal housing program (USHA) will doubtless continue through the year. A moderate increase is indicated in one- and two-family houses, on the assumption of peak activity in the spring, and seasonal tapering off later. Accommodations were provided for about 215,000 families during 1938 in the United States. For 1939, the F. W. Dodge Corporation estimate that between 240,000 and 250,000 families will be accommodated. These figures include apartments, and one- and two-family houses, and count both new buildings and additional dwelling units provided through alterations. See BUSINESS REVIEW.

VALUE OF TOTAL CONSTRUCTION CONTRACTS
(37 EASTERN STATES)
[In thousands of dollars]

Classification	1937 Actual	1938 Estimate*	% Change from 1937

* Based on 10 months' data. F. W. Dodge Corp.

From a survey by Dun & Bradstreet, Inc. of the building activities in 215 important cities in the United States, the total estimated cost of building permits granted during the 12 months of 1938 amounted to \$1,147,543,436, a slight gain as compared with the \$1,130,915,007 for 1937, and the largest total recorded for the past seven years. Although the year-to-year advance was small—

1.5 per cent—it marked the fifth consecutive yearly gain, with the rise from the 1933 low point of \$313,676,276, amounting to 266.0 per cent.

Analysis of changes by geographical groups for the year showed 4 advances and 4 declines. New York City alone disclosed a gain of 19.4 per cent, while the 214 outside cities revealed a drop of 5.2 per cent.

BUILDING PERMITS IN THE UNITED STATES FOR 215 CITIES

Outside N. Y. C. ..	782,241,740	825,057,153	-5.2

A preliminary estimate by *Engineering News-Record* of total construction volume (including buildings, dams, etc.) for 1938 is \$6,480,000,000, made up of Federal construction \$560,000,000, state and municipal \$3,120,000,000, private \$1,600,000,000, and residential \$1,200,000,000. This represents an 11 per cent gain over the estimated total for 1937.

The Department of Commerce, Division of Economic Research, estimates that \$5,185,000,000 was invested in new construction, plus \$1,075,000,000 in work relief, plus \$2,530,000,000 for maintenance, making a total of \$8,790,000,000 spent for construction and maintenance in 1938. This estimate represents Federal construction, maintenance, and Federally financed work relief \$2,430,000,000, non-Federal construction and maintenance \$1,675,000,000, private construction and maintenance \$4,685,000,000.

BUKHARIN, bōo-khā'rēn, NIKOLAI IVANOVICH. A Russian editor and economist, executed for treason, Mar. 14, 1938. Born in 1888 he was educated at the University of Moscow where he joined the Social Democratic Party. From 1902, when he was first arrested, to 1917, his life was a series of arrests, imprisonments, and banishments. With Lenin he published *Pravda* in Austria, and in 1916 he edited *Novy Mir* (*The New World*) in New York City. After the Russian Revolution in 1917 he returned to Russia where he became a member of the Central Committee of the Communist Party. He was one of the leaders of the Left Wing Bolsheviks, editor of *Spartak*, and opponent to the Brest Litovsk Treaty (1918).

A member of the Politbureau from 1918 to 1929, in 1926 he succeeded Gregori Zinoviev as head of the Third International. He resigned in March, 1929, and apparently allied himself with the Trotskyists and in August of that year he was suspended and subsequently expelled from the Communist Party. Acknowledging the supremacy of Stalin he was restored to Party membership, but not until 1934 was he again admitted to favor. Then with Karl Radek he was appointed editor of *Izvestia*, the government newspaper. Until 1936 they were firm supporters of the government, but thereafter they deviated occasionally from the Party line. In 1937 Bukharin was again expelled from the Communist Party, and on March 5 was arrested on charges of subversive activities. See UNION OF

SOVIET SOCIALIST REPUBLICS under *History* for an account of the trial.

One of the foremost of Soviet intellectuals and propagandists, a facile writer and a fluent orator, Bukharin was a member of the Academy of Science, the Communist Academy, and President of the Association of Research Institutes. He was the author of *Theory of Historic Materialism* (1925), *A.B.C. of Communism* (in collaboration), *Economics of the Transition Period*, "Theory and Practice from the Standpoint of Dialectical Materialism" in *Science at the Cross-Roads*, and editor of *Marxism and Modern Thought* (1935).

BULGARIA. A Balkan monarchy. Capital, Sofia. King in 1938, Boris III, who succeeded to the throne Oct. 3, 1918.

Area and Population. The area is 39,825 square miles and the population in January, 1938, was estimated at 6,280,000 (1934 census, 6,077,939). About 21 per cent of the population is urban. Estimated populations of Sofia in 1937 and all other cities in 1936 were: Sofia, with suburbs, 350,000; Plovdiv (Philippopolis), 125,000; Varna, 75,000; Ruse (Ruschuk), 51,000; Burgas, 30,000. Living births in 1937 numbered 150,040 (23.9 per 1000 inhabitants); deaths, 84,432 (13.4); marriages, 50,772 (8.1).

Religion and Education. The independent Bulgarian Orthodox Church is the state church. At the 1934 religious census it had 5,128,890 members as against 821,298 Moslems, 48,398 Jews, 45,704 Roman Catholics, 23,476 Armenian-Gregorians, 8371 Protestants, and 1802 others. About 40 per cent of the adult population are illiterate. In 1936-37 there were 7974 schools, with 30,879 teachers and professors and 1,072,397 students. Attendance in kindergarten and elementary schools was 704,468; pre-gymnasium and gymnasium, 324,218; higher learning and universities, 11,400; trade and professional schools, 41,735; others, 285.

Production. Agriculture and fishing support about 80 per cent of the population. The arable land, comprising 39 per cent of the total area, was divided into 750,613 farms in 1934. Yields of the chief cereals in 1938 were (in metric tons): Wheat, 1,608,900; barley, 319,000; rye, 224,100; oats, 123,000; corn (1937), 859,300. Production of other crops in 1937 was: Potatoes, 5,695,000 bu.; tobacco, 69,052,000 lb.; wine, 38,306,000 gal.; sugar beets, 181,000 metric tons; beet sugar (1937-38), 23,000 metric tons; sunflower seed, 332,296,000 lb.; attar of roses, 92 oz.; silk cocoons, 3,527,000 lb. Coal production in 1937 was 1,688,000 metric tons; iron ore, 12,000 metric tons. There is little manufacturing.

Foreign Trade. Imports in 1937 were valued at 4,929,158,000 leva (3,181,068,000 in 1936) and exports at 5,019,499,000 leva (3,910,382,000 in 1936). In old U.S. gold dollars, the respective figures were \$37,398,000 (\$24,346,000) and \$38,084,000 (\$29,927,000). Raw cotton, iron and steel products, textiles, mineral oils, and wood pulp were leading imports. Leading exports in order of value in 1937 were tobacco leaf, wheat, eggs, fresh grapes, and dressed poultry. Germany supplied 54.8 per cent of the 1937 imports for consumption (61 in 1936); United Kingdom, 4.7 (4.6); Czechoslovakia, 5.0 (7.7); Italy, 5.0 (0.6). Of the 1937 exports, 43.1 per cent by value went to Germany (47.6 in 1936); 13.8 to the United Kingdom (11.6); Czechoslovakia, 5.6 (3.3); Italy, 4.2 (3.6).

Finance. Actual budget receipts in 1937 were 9,348,000,000 leva (including railway receipts of 1,669,000,000) and expenditures were 8,707,000,000

leva (railway expenditures, 1,620,000). Including railway operations, the 1938 estimates were: Receipts, 9,077,000,000 leva; expenditures, 9,059,000,000 leva. The 1939 estimates, excluding railway operations, balanced at 7,732,754,000 leva. The public debt on Mar. 31, 1938, totaled 28,734,000,000 leva (funded exterior, 19,833,000,000; floating interior, 2,169,000,000; debts guaranteed by the state, 6,732,000,000). The unit of currency is the lev (plural, leva), with an average exchange rate of \$0.01285 in 1937 and \$0.0124 in 1938.

Transportation, etc. In 1936 there were 1801 miles of standard-gage railways (1771 miles of state lines) and 260 miles of narrow-gage lines (all state owned). In that year the standard-gage lines carried 8,723,000 passengers and 4,620,000 metric tons of freight and had gross receipts of 1,149,000,000 leva. Roads and highways in 1937 extended 16,030 miles; number of automobiles, 4111 on Jan. 1, 1938. Air lines link Sofia with the leading cities of Europe and the Near East. In 1936, 6699 ships of 1,811,423 net registered tons entered the Black Sea ports and 14,211 ships of 2,317,334 tons the Danube ports.

Government. The Constitution of 1879 remained suspended from the Georgiev coup d'état of May 19, 1934, through 1938. All political parties were dissolved in 1934 and the formation of new ones was prohibited. King Boris ruled as virtual dictator after overthrowing Premier Georgiev's dictatorship on Jan. 22, 1935. For developments in 1938, see *History*.

HISTORY

Internal Developments. The struggle between parliamentary and anti-parliamentary forces in Bulgaria continued during 1938, with King Boris holding the balance of power between the hostile factions. That the conflict dividing the nation was reflected in the government itself was demonstrated by the cabinet reorganization of January 24. War Minister Christo Loukov, who favored continuation of a rigid dictatorship, and Minister of Interior Krasnovski, who urged immediate restoration of parliamentary government, were both dismissed. Premier George Kiosseivanov, who espoused the King's policy of maintenance of the status quo, was retained at the head of the government.

Immediately afterwards the government conducted a wholesale roundup of Leftists to prevent their participation in the electoral campaign. On the other hand, King Boris strengthened his position by accepting the retirement of several leading army officers opposed to restoration of parliamentarism. On April 30 the police banned Professor Kantartjev's Nazi organization. The parliamentary elections provided for in the October, 1937, electoral law (see 1937 YEAR BOOK, p. 112) were held on the four Sundays of March. Women voted in national elections for the first time.

Despite the fact that the candidates were forbidden to represent or campaign for political parties, many opponents of the government were elected. When the new Parliament convened on May 22, the government candidate for president of Parliament was elected by a vote of 92 against 63, with five Deputies abstaining. As Parliament had been reduced to the status of a mere advisory body, the anti-government bloc immediately brought forward their demand for the restoration of representative democratic government, including their former powers of legislating. Several weeks of wrangling followed, with the debate hinging upon the recommendation, made by a parliamentary com-

mittee charged with examining election results, that five opposition Deputies alleged to be Communists be deprived of their seats.

On June 17 the 65 Opposition Deputies walked out of Parliament in protest against the government's methods. Returning two weeks later, they submitted a memorandum urging the King to restore constitutional rights, including freedom of the press and amnesty for all political offenses, and to authorize the establishment of a new government from the ranks of Parliament. The government's response to this appeal was to pass a press law which proclaimed that the press was free but imposed a far more drastic censorship than that previously in effect. On September 27, during the European crisis over Czecho-Slovakia, the outstanding pro-democratic weekly newspaper in Sofia was suspended. Two other democratically inclined newspapers were warned to modify their editorial policies or suffer the same fate.

The government's repressive measures were intensified after the assassination in Sofia on October 10 of Maj.-Gen. Yordan Peyev, Chief of Staff of the Bulgarian Army, and his aide-de-camp, Major Stoyanov. The assassin was Stoiil Kirov, who shot himself immediately after the act and died two days later in a Sofia hospital.

The police and troops immediately began a roundup of hundreds of Oppositionists, including leaders and members of the Imro, friends of the former dictator, Col. Damian Veltchev; various Communists, and five members of Parliament. On October 13 Sofia was placed under rigid martial law and all business activities were suspended while troops proceeded with arrests and "the repression of subversive elements." The same day the government announced that a wide conspiracy for a revolutionary uprising had been uncovered and that King Boris had ordered the military measures to frustrate it. Several hundred of more than 1200 persons arrested were interned in remote villages. The five Deputies arrested were released, however, and took part in an Opposition demonstration demanding the government's resignation when Parliament reconvened on October 23. On November 9 Parliament rejected a government bill for the establishment of a state press. The resulting cabinet crisis was ended by reorganization of the ministry on November 14. Kiosseivanov remained as Premier and Minister of Foreign Affairs.

Foreign Relations. The rapprochement of Bulgaria and Yugoslavia, manifested by the signature of a treaty of "perpetual peace and friendship" on Jan. 24, 1937 (see 1937 YEAR BOOK, p. 112), paved the way for the further development of amity among all of the Balkan countries in 1938. On July 31, 1938, a pact was signed at Salonika, Greece, by Premier John Metaxas of Greece as president of the Balkan Entente (q.v.) and Premier Kiosseivanov by which Bulgaria, Greece, Rumania, Turkey, and Yugoslavia pledged themselves to settle their mutual disputes by peaceful means. The Balkan Entente also renounced all claims to enforcement of the Treaty of Neuilly, which drastically restricted Bulgaria's armaments, and agreed to the abolition of the demilitarized zones along the frontiers of Greece, Turkey, and Bulgaria established by the Treaty of Lausanne. Bulgaria thus obtained the legal right to restore conscription and to arm as heavily as she considered necessary.

Bulgaria had previously rearmed to a considerable degree in violation of the Neuilly Treaty with the tacit consent of the Balkan Entente. The treaty of July 31 not only regularized this situation but

enabled Bulgaria to undertake a considerable expansion of her armament program with the aid of her enemies in the World War. Early in August, a French banking syndicate loaned Bulgaria 375,000,000 francs (about \$10,360,000) for the purchase of armaments and railway equipment in France. In connection with its rearmament program, the government in September commenced the registration of all male citizens for military service and of all material suitable for use in time of war. An airplane manufacturing plant built by the Italian Caproni Company was opened at Kazanlik on October 17. On October 25 Parliament approved the issuance of a 4,500,000,000 leva loan for armaments to be ordered in Germany. Meanwhile, the demilitarized zones in Thrace had been reoccupied by Greek, Bulgarian, and Turkish troops on August 28.

Bulgaria's agreement with the Balkan Entente was expected to lead to its eventual association with the Entente. The July 31 treaty had been preceded by other evidences of growing inter-Balkan friendship. On April 21 Bulgaria and Yugoslavia signed a protocol providing for the removal of barbed-wire entanglements and machine-gun emplacements along the frontier. On June 8 Premier Kiosseivanov emphasized to Parliament Bulgaria's close relations with Yugoslavia and her other Balkan neighbors, at the same time denying rumors that Bulgaria had a secret understanding with Germany and Italy.

However, the partition of Czecho-Slovakia agreed upon at Munich late in September aroused Bulgarian hopes for German aid in securing the restoration of Bulgarian minorities ceded to Greece, Rumania, and Yugoslavia by the Treaty of Neuilly. It thus gave a powerful stimulus to the elements in Bulgaria opposed to co-operation with the Balkan Entente and favoring a pro-German foreign policy. Such a policy was advocated by the Military League, the Fascist movement under Prof. A. Tsankov, and the Imro, which was believed to have plotted the assassination of Major-General Peyev in furtherance of this objective.

The Kiosseivanov Government announced a policy of strict neutrality during the European crisis over Czecho-Slovakia. Nevertheless, King Boris turned up in Berlin, where he was reported seeking German aid for the return of part of the Dobruja district along the Black Sea from Rumania. On October 30 the President of the Bulgarian Parliament publicly announced that Bulgaria would demand the return of some territories lost during the World War and hoped to obtain them by peaceful means. Great demonstrations in support of this demand took place in Sofia in connection with the observance on November 27 of the 19th anniversary of the signing of the Treaty of Neuilly. Declaring the demonstrations were "of a revolutionary character," the government dispersed the mobs, ringed the capital with troops, proclaimed martial law, and forbade the people to leave their houses. More than 350 demonstrators were arrested.

BUND, GERMAN-AMERICAN. See FASCISM.

BURGENLAND. See AUSTRIA.

BURMA. A British Crown Colony, formerly a province of British India, from which it was separated on Apr. 1, 1937. Total area, 261,610 square miles comprising Burma proper, with the Chin Hills and Kachin Hill Tracts (192,158 sq. m.), Shan States (62,335 sq. m.), and unadministered territory (7,117 sq. m.). Total population (1931), 14,667,146. Rangoon, the capital, had 400,415 inhabitants; Mandalay, 147,932. Over 84 per cent of

the people, in 1931, were Buddhists. There were 756,464 students in the schools and colleges during 1936-37.

Production and Trade. The area sown to rice in 1937-38 totaled 12,856,350 acres from which 6,937,400 metric tons of rough rice were produced. Millet, cotton, tobacco, and sesamum were other important agricultural products. At the end of 1936-37 the reserved forests had an area of 31,339 square miles, from which the out-turn of teak by lessees for the year was 345,793 tons. Mineral production (1936), in metric tons, was tin, 4689 (4100 in 1937); tungsten ore, 3006; silver, 185.1 (192 in 1937). The output of petroleum in 1936 was 265,570,120 gal. In 1936 there were 985 factories of all kinds, the total number of employees being 89,230. In 1937-38 imports were valued at Rs238,027,428; exports Rs499,179,456 (rupee averaged \$0.3733 in 1937).

Communications. In 1936-37 the total length of roads was 10,139 miles. There were 60 miles of navigable canals. The Irrawaddy (navigable for 900 miles from the sea) and its tributaries (the Chindwin, the Shweli, and the Myitnge) form the chief artery of commerce. As a result of the separation of Burma from India, the railways were taken over by the government of Burma dating from Apr. 1, 1937, the mileage open to traffic in 1936-37 was 2060. The Burma railways have reached Myitkyina on the Upper Irrawaddy, and a branch line has been extended to the Shan States.

Finance. Revised estimates for the year ended Mar. 31, 1938: Revenue, Rs150,086,000; expenditure, Rs149,405,000. Budget estimates for 1938-39: Revenue, Rs158,083,000; expenditure, Rs154,229,000. Burma's indebtedness to India was estimated at Rs507,500,000 in March, 1938. In addition the government of Burma has to bear $7\frac{1}{2}$ per cent of the liabilities of the government of India in respect to central government pensions in force at the date of separation.

Government. The Government of India Act, 1935, as passed by the British Parliament, provided for the separation of Burma from India, effective Apr. 1, 1937, and its establishment as a Crown Colony within the British Empire. Executive and administrative powers were vested in a governor appointed by the Crown. The governor is assisted by an executive council of not more than 10 ministers, chosen by him. Legislative powers over matters pertaining to Burma's internal affairs were vested in a legislature, consisting of a senate of 36 members, partly appointed by the governor and partly elected, and a house of representatives of 132 members elected by popular suffrage. Considerable areas in the northern and eastern hill districts were excluded from the legislature's control and placed directly under the Governor. The Government of India Act provided that laws in force in India as of Apr. 1, 1937, should remain in force in Burma until such time as the Burmese Government formulated laws of its own. Governor, Sir Archibald D. Cochrane, who assumed office May 8, 1936, and was reappointed as head of the new state effective Apr. 1, 1937.

History. The rapid growth of Burmese nationalism evidenced itself in connection with the serious riots that broke out late in July, 1938, between Burmese Buddhists and Indian Moslems. The rioting started following the publication of a book written by an Indian Moslem which the Buddhists considered insulting to their religion. Burmese mobs paraded through the streets of Rangoon attacking Indians, looting their shops, and shouting

"Burma for the Burmese." The rioting spread from Rangoon to Mandalay and other districts. British troops were compelled to fire on both Burmese and Indian mobs and to adopt severe measures against public gatherings and demonstrations to restore order. The authorities also banned the offending book. In the first phase of the rioting, 149 persons were killed and hundreds injured. A large emigration of Indians from Burma followed and many of those who remained refused to reopen their shops for fear of further attacks. Since the Indians were the principal purveyors of food-stuffs in Burma, some hunger among the Burmese resulted.

These events had repercussions in the Senate and House of Representatives. There were blows between Burman and Indian members. One stormy session forced the Speaker of the House to suspend its sitting. Opposition criticism was aimed at the government methods of repressing the rioters. A no-confidence vote in Premier Ba Maw's coalition ministry failed of carrying by only five votes in the House on August 26. Early in September the rioting broke out anew in Rangoon, causing 15 deaths. On September 6 an Opposition leader in the House, U Ba Hlaing, threatened both Europeans and Indians with mob action. The Speaker again suspended the sitting and on September 9 the British Governor invoked his special powers under the 1935 Constitution to impose more drastic repressive measures against the rioters. Without consulting the Legislatures, he proclaimed the Rangoon Emergency Security Act empowering the police to arrest without warrant and to hold such prisoners 15 days without bail. Forbidden even to discuss this measure, the Legislatures displayed increased hostility to those provisions of the Constitution giving the Governor special powers for "the prevention of any grave menace to the peace or tranquillity of Burma or any part thereof." The Governor was moved to use these powers partly by a motion adopted by the Central Legislature in India demanding immediate action by the British authorities to end anti-Indian violence in Burma.

The Governor had previously vetoed a bill passed by the Burman House of Representatives which sought to deprive considerable numbers of former government servants of their pensions. With these exceptions, Dr. Ba Maw's native government was given full leeway in the administrative organization of the new state and the enactment of social and economic reforms. The ministry concentrated its attention on efforts to improve agricultural conditions, lighten peasant indebtedness, and encourage the return to the land of many Burmans who had flocked to the cities. Medical dispensaries were established in every township. A long-term educational program was adopted and a first step toward its application was taken through a bill establishing compulsory free education in certain areas. Other government measures and plans provided for a new short-wave broadcasting station at Rangoon to serve all Burma, the employment of the radio and moving-picture films for adult education, the reopening of the Agricultural College in Mandalay, the establishment of a polytechnic in Rangoon, and of a fine arts school and state library. Financial reforms introduced included the abolition of the poll and household taxes and the establishment of a State lottery to compensate in part for the consequent reduction in revenues.

See RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC; SIBERIA.

BUSINESS REVIEW. The course of business during 1938 was practically the reverse of that of the preceding year. Whereas the first half of 1937 was a very prosperous period during which industrial activity in the United States almost equaled the record level of 1929, the second half of the year was marked by a very severe recession. The first half of 1938, by contrast, witnessed a sustained low level of industrial activity, but during the second half of the year a recovery developed that was probably as sharp as any recorded within so short a period of time. As a result, the Federal Reserve Board's index of industrial activity for December was the highest for that month in any year since 1928, except 1936.

Economists will probably be disagreed for a long time to come in their interpretation of this spectacular recovery from the 1937-38 recession. The low level of production during the first half of 1938 permitted not only manufacturers but also distributors and consumers to draw down the large stocks of goods that had been accumulated during the two preceding years in anticipation of higher costs and prices. The basis was thus laid through deflation of inventories for a substantial recovery, as production had to be expanded to meet current consumption requirements when the latter could no longer be filled in part from stocks on hand. Accordingly, there would probably be general agreement that some improvement in business activity from the low levels of the first half of the year would have occurred in any event, regardless of whether or not the Government adopted special recovery measures of its own. On April 14, the President sent a special message to Congress outlining a program of Federal spending and lending to stimulate economic recovery which undoubtedly spurred the business recovery of the second half of the year. However, there is wide difference of opinion as to whether or not this pump-priming program was the decisive factor in making the recovery as rapid as was the case.

The course of business activity during 1938 may be traced through the index of industrial production of the Federal Reserve Board as shown in the table below:

INDEX OF INDUSTRIAL PRODUCTION
FEDERAL RESERVE BOARD
[Adjusted for seasonal variations; monthly average

* Preliminary.

A feature of the upturn in business activity was the rise in new residential construction to a level well above the 1937 peak. The failure of building

activity to register more than a partial recovery from the low point reached in 1933 during the subsequent years had been one of the most discouraging features of the economic situation. It had been pointed out repeatedly, however, that the protracted period of sub-normal construction would inevitably culminate in a major revival of building activity. The fact that the construction industry participated so fully in the recovery that began during the second half of 1938 gave the promise that this industry would at last resume its normal place as a contributing factor to general economic activity. Opinions differed as to how far exceptionally favorable financing conditions made possible by the liberalization of mortgage insurance by the Federal Housing Administration, and the slum clearance program conducted by the U.S. Housing Authority, accounted for the vigor of the upturn.

The volume of output of six major industries, with comparisons with previous years, is indicated in the following more detailed tables:

Agriculture. American agriculture did not remain in full during 1938 the sharp gains registered in the preceding year, which was the most favorable for the nation's farmers since 1929. For the year as a whole, the cash income of the farm population suffered a shrinkage of 11 per cent from the 1937 level. The chief reason for this decline was the fall in commodity prices which began in the spring of 1937 and continued to some extent during the first half of 1938. This decline in farm prices was in part a reaction from the high levels reached as an aftermath of the 1936 drought. A contributing factor was the decline in business activity and the troubled international situation, which affected adversely the demand for American agricultural products at home and abroad. Increased production in 1937 and 1938 of various crops offset the decline in prices only to a partial extent. Another factor moderating the decline in farm income was an increase in Government payments to farmers of \$133,000,000 over the 1937 total.

In February, 1938, Congress enacted a new Agri-

cultural Adjustment Act providing for more effective control over the production of five staple farm products, cotton, wheat, corn, tobacco, and rice. This law also made provision for the establishment of an ever-normal granary plan, under which surplus production of years of large crops would be impounded through Government loans to growers, while stocks thus accumulated would be resold in the market whenever prices declined. Loans were made on the 1938 cotton and wheat crops under this provision at levels that sustained the prices of these commodities well above the levels to which otherwise they would have fallen. This hampered exports, as foreign buyers could purchase their requirements more cheaply from other producing countries that did not peg prices artificially through government loans. Recognizing this, the Department of Agriculture embarked upon a program of subsidizing wheat exports late in 1938 in order to sell part of the surplus output abroad, but cotton

exports were not promoted artificially in this way and they fell to the lowest level of the century. Toward the end of the year, a good deal of dissatisfaction was expressed with the functioning of the Agricultural Adjustment Act of 1938, and numerous proposals were advanced for its amendment. The Secretary of Agriculture indicated that he favored a lesser use of crop loans, because they discouraged exports, but as an offset he was ready to increase further parity payments made to farmers. The cost of the farm adjustment program to the Government may be increased to exceed a billion dollars annually in soil conservation, parity, and other outlays if this plan is adopted.

Live-stock producers did better than most other farm groups. Output was larger, and prices held up fairly well during 1938. Dairy farmers were aided by marketing plans which stabilized prices of fluid milk, while Government buying of butter sustained income from that source.

Cash income of farmers during the past two years has fluctuated as follows:

CASH FARM INCOME
(Including AAA Payments)
(Millions of dollars)

	1937	1938
January	681	620
February	557	487
March	707	572

Tobacco	318	294
All livestock	4,362	3,990
Meat animals	2,039	1,893
Dairy products	1,530	1,430
Poultry and eggs	637	569
Government payments	367	482
Total income including Government payments	8,574	7,632

^a Preliminary.

Manufacturing. The durable goods industries, which had suffered the sharpest decline in activity during 1937, registered the widest gains in 1938. Building, iron and steel manufacturing, and automobile manufacturing played a leading part in the broad industrial recovery of the second half of the year.

The upturn in building began earlier than that of most industries, following the adoption by Congress shortly after the turn of the year of a series of amendments to the Federal Housing Act. For the year as a whole, new construction contracts placed were somewhat smaller in dollar value than in the year before. However, owing to a moderate decline in building costs, the physical volume of new residential construction was actually larger than in 1937. Approximately 300,000 new dwelling units were built during the year. This does not include the very ambitious slum clearance program of the U.S. Housing Authority, under which approximately \$650,000,000 of loans to local housing bodies were approved during the year. Actual construction on slum clearance projects will assume substantial proportions only in 1939. Non-residential building remained at a low ebb during the year, except for public works projects, which increased sharply following the adoption of the spending-lending program by Congress. New construction contracts for residential and all other buildings varied from month to month during 1937 and 1938 as shown in table in next column.

Operations in the steel industry remained at a relatively low level during the first half of the year, but slightly above 30 per cent of capacity. They turned upward sharply in the second half of the year, rising to a peak of 62 per cent in November, although the usual seasonal decline occurred in the closing weeks of the year. Operations expanded sharply when prices were reduced in June and dif-

CONSTRUCTION CONTRACTS AWARDED

ferentials in quotations between Pittsburgh and other basing points were largely eliminated. Further price reductions occurred in October, affecting chiefly automobile steel, but these proved short-lived. Despite the drop in prices, wage rates were sustained, so that profit margins of steel producers were materially reduced. In order to cut their costs, the steel companies spent substantial sums upon the modernization of their productive facilities which largely increased efficiency. The production of steel ingots month by month, with comparisons with 1937, are shown in the following summary:

STEEL INGOT PRODUCTION ^a
(Thousand long tons)

Year	49,503	27,839

^a Source: American Iron and Steel Institute.

The automobile industry entered 1938 with large inventories, as production of new model cars in the closing months of 1937 reflected an overestimation of the available purchasing power. Manufacturers curtailed their schedules sharply during most of 1938, while inventories of new and used cars were brought down to low levels and the basis laid for a closer relationship between output and actual consumption. In 1937 the automobile industry produced 5,016,000 units, a record exceeded only in 1929. Expectations of higher prices and fears of interruptions of production due to labor troubles in that year accelerated both consumer and dealer buying, so as to create an unsound situation in the industry. The 1938 production of some 2,650,000 cars in the United States and Canada, by contrast, was sub-normal in that it did not fully cover estimated normal replacement requirements. With the introduction of 1939 model automobiles in November, retail sales improved materially, and in the closing weeks of the year production rose above the level of the corresponding period in 1937. Small price reductions and substantial changes in models, as well as the improvement in general economic conditions, contributed materially to the revival in the automobile industry. The output of new cars month by month compared as follows:

OUTPUT OF NEW AUTOMOBILES

	1937	1938 ^a
January	379,603	209,506
February	364,193	186,523
March	494,121	221,796

October	329,876	209,522
November	360,055	372,358
December	326,234	388,436
Total	4,808,974	2,489,635

^a Preliminary. Source: U.S. Department of Commerce and Automobile Manufacturers Association.

The consumers' goods lines generally conformed to the pattern of the steel and automobile industries. Production was at a low level during the first half of the year, as inventories on hand were drawn down and the basis thus laid for an early recovery. During the second half of the year, buying by both consumers and distributors increased, and operations expanded sharply in the textile manufacturing, shoe manufacturing, and other important lines. By the close of the year, activity in these industries was well above the corresponding 1937 level.

Distribution. The volume of retail trade showed no such wide fluctuations as did manufacturing activity. One important reason for this was the increase in Government relief spending, which tended to sustain consumer income despite the drop in industrial payrolls. Another contributing factor was the relative stability of farm income, also induced in large part by Government intervention. The upturn in business activity during the fall was not fully reflected in retail trade statistics for a time, because unseasonably warm weather curtailed apparel buying. However, a good deal of this business was regained in December, and with the help of an active holiday season retailers reported dollar sales volume for the final month of the year somewhat larger than the year before, despite the fact that retail prices averaged about 5 per cent less. Department store sales and inventories as reported by the Federal Reserve Board on a monthly basis were as follows:

INDICES OF MONTHLY DEPARTMENT STORE SALES AND STOCKS

[1923-25 = 100; adjusted for seasonal variation]

	1937		1938

Commodity Prices. As compared with the three preceding years, commodity prices during 1938 were relatively stable, with the main trend downward. Prices of farm products, after declining during the spring under the weight of large supplies, became firmer as Government loans to growers, plans for further production curtailment, and expanding consumption exerted their effect. Prices of industrial raw materials, such as metals, rubber and lumber, improved during the closing months of the year with the rise in business activity. Manu-

factured goods prices, on the other hand, which normally lag behind raw material prices, sagged during the year, the anti-monopoly investigation tending to encourage price cuts in the steel manufacturing and other industries. Oil prices were depressed because production tended to outrun the demand.

Business men for the most part paid less attention to monetary developments as they might affect commodity prices. Although huge gold imports raised the monetary gold stock of the United States to a far higher level than ever before, while excess reserves of the member banks of the Federal Reserve System rose to a new peak and deposits in commercial banks expanded, there was no renewal of the rush to expand inventories because of the fear of "inflation" which was so marked late in 1936 and early in 1937. The sharp decline in commodity prices during 1937 discouraged a renewal of such anticipatory buying, and business men displayed more skepticism with regard to vague predictions of coming price inflation due to monetary conditions.

The wide discrepancy between prices of raw materials and finished products that developed during 1937 continued during the year, as was inevitable because of the stability of wage scales in industry and increases of hourly wages in certain lines because of the application of the Fair Labor Standards Act. However, as prices of some farm products and most industrial raw materials improved later in the year, while finished goods prices registered small declines, the divergence between the two groups of prices narrowed somewhat.

The cost of living registered a small decline during the year, especially food and fuel prices.

The wholesale price index of the Bureau of Labor Statistics fluctuated as follows:

WHOLESALE PRICE MOVEMENT
[1926 = 100]

Combined index	
1929	95.3
1930	86.4
1931	73.0
1932	64.8
1933	65.9
1934	74.9
1935	80.0
1936	80.8
1937	86.3

December	81.7	77.0	72.8	67.6
Year	86.3	78.6	86.4	68.6

Industrial Earnings. Several conflicting factors affected the course of business profits during 1938. The most important of these was the upturn in volume during the last half of the year, which not only increased the total of sales, but also, as usual, made for a wider margin of profit. Another favorable factor was a marked improvement in industrial efficiency in a number of industries, which had been sadly impaired as a result of the strikes and unionization campaigns of 1936 and 1937. In many cases, in fact, the impairment of efficiency during those two years was more than corrected

in 1938. On the other hand, the inflexibility of wage scales in most industries, the application of minimum wage and maximum hour standards under the Fair Labor Standards Act, the high level of taxation and Government pressure for lower prices in the steel, building materials, and other industries combined to keep down the level of profits. In a number of industries such as steel manufacturing, the "break even point" is considerably higher than it was a number of years ago as a result of these influences.

For the year as a whole, profits ruled far below those of 1937, when quite favorable conditions prevailed during the first eight months of the year.

Business Failures. Commercial failures increased during the first half of 1938, as is usual during recession periods. However, as conditions improved during the latter half of the year, failures decreased in number and size. As has proved true in the past, a short-lived recession such as that that lasted from September, 1937, to July, 1938, does not exert sufficient pressure upon business concerns to lead to any really serious failure epidemic. The monthly record of commercial failures as reported by Dun & Bradstreet was as follows:

COMMERCIAL AND INDUSTRIAL FAILURES IN THE UNITED STATES *

	1937		1938	
	Number	Liabilities (thous. of dollars)	Number	Liabilities (thous. of dollars)
January	841	12,003	1,377	21,415

* Revised series by Dun and Bradstreet.

The sharp decline in traffic and the failure to obtain any reduction in wages caused the railroad industry to suffer a severe decline in earnings during the year. The earning power of this industry almost fell back to the low levels of 1932 and 1933, as wage scales have risen 17½ per cent since those years. No material progress was made in reorganizing the many railroads in equity receivership or bankruptcy, and a few additional lines initiated reorganization proceedings. Late in the year, the Baltimore & Ohio and Lehigh Valley attempted to obtain a sharp reduction in their interest charges by seeking the assent of the bondholders to a voluntary reduction in payments for a limited period of time.

CALIFORNIA. Area and Population. Area, 158,297 square miles; included (1930) water, 2645 square miles. Population: Apr. 1, 1930 (census), 5,677,251; July 1, 1937 (Federal estimate), 6,154,000; 1920 (census), 3,426,861. Sacramento, the capital, had (1930) 93,750; Los Angeles, 1,238,048; San Francisco, 634,394; Oakland, 284,063.

Agriculture. The table in next column shows the acreage, production, and value of the chief crops of California in 1938 and 1937.

Mineral Production. The fourth successive increase in California's yearly production of petroleum carried the total to 238,521,000 bbl. for 1937, from 214,773,000, in value \$215,900,000, for 1936. The greater part of the gain of 1937 was

Crop	Year	Acreage	Prod. Bu.	Value

matched by added exports of oil from the State to the Far East, and demand for the product was said to have warranted the growth of the output; there was no urgent general demand for new measures of proration. The greater part of the rise in yearly output occurred in the Los Angeles basin, which again became the State's chief producing district. The yield of natural gas rose somewhat, to 357 billion cu. ft. for 1937, from 320 billion, valued at \$82,401,000, for 1936. Of the gas produced in 1937, 231 billion cu. ft. went to public utilities. The quantity of gasoline extracted from natural gas, 612,467,000 gal. for 1937, exceeded the total of 593,416,000 gal., valued at \$35,437,000, for 1936.

The quantity of California's yearly production of gold, for 1938, exceeded that for any prior year after 1862. As approximately determined by the U.S. Bureau of Mines, ore mined in 1938 contained recoverable gold totaling 1,294,400 oz.; this was about 10 per cent more than the total, of 1,174,578 oz., for 1937; by value, these totals came to \$45,304,000 (1938) and \$41,110,230 (1937). While gold held by far the chief place in metal-mining, a substantial production of silver continued, attaining about 2,755,000 oz. for 1938, as against 2,888,265 oz. for 1937. As the Government paid less for silver than it had the year before, the yield of silver fell, by value, to \$1,781,010 (1938), from \$2,234,073 (1937). The small production of copper shrank to some 2,210,000 lb. (1938), from 10,502,000 lb. (1937), and by value to \$216,680, from \$1,270,742. In addition to gold, silver, and copper, mines produced a little lead and zinc; and the value of the year's production of all five metals attained \$47,349,570 for 1938, as against \$44,757,593 for 1937.

Increased operation of mines already producing, the reopening of old producers that had been closed, and yields from new enterprises coming into production all attended the further increase of the production of gold in 1938. The Grass Valley and Nevada City district held its place as the foremost source of the output.

Charities and Corrections. The Department of Social Welfare was the State's administrative agent for aid to the needy aged, children, and blind, and for divers other services. California's task of supporting the aged poor continued to grow. The number of recipients of old-age assistance attained 123,722 at the end of October, or 44 per cent above the figure of a year earlier. The beneficiaries

received, in that month, \$4,016,019, or 40 per cent more than a year earlier. The Legislature appropriated \$6,000,000 for distribution in the fiscal year, over and above its ordinary part of the cost of this aid for the aged; the money, at the rate of \$500,000 a month, was shared among all the counties, at the rate of their several totals of cost for these pensions. This temporarily lifted from the counties about half of their burden of individually matching the State's payments toward this cost. As the State supported its aged poor at a monthly rate (\$32.36 in August) higher than the \$30 up to which the Federal Government would pay one-half, the State and county contributions considerably exceeded the Federal. While the State's extra contribution of \$6,000,000 was nominally temporary, it raised the question of future reduction of the contribution required of the counties.

Counties, on the other hand, continued to pay, each for itself, the cost of "indigent aid," or general outdoor poor-aid. This expense, for all the counties, rose above \$900,000 for March and thereafter diminished, to \$823,237 for October. Los Angeles County alone paid out nearly half of this sum; it had on its hands not only the needy unemployed of its regular population but people who had drifted in during the early 'thirties. See OLD AGE PENSIONS.

Legislation. Called into special session by Governor Merriam, mainly for the enactment of new laws to regulate drilling for petroleum on tidal lands, the Legislature convened March 7 and adjourned March 13. It enacted authority for a commission, to be composed of the Lieutenant-Governor, Comptroller, and Director of Finance, to administer the leasing of the State's oil-bearing and other mineral lands. Its chief appropriations were: \$4,000,000 for aid to the needy unemployed; \$6,000,000, partly for aid to sufferers in recent floods and partly for increases in some State salaries, and \$6,000,000 for the counties, toward their payment of aid to the aged for one year. It voted to propose an amendment to the State constitution, authorizing the Legislature to transfer the duties of the State's Relief Administration, presumably the Social Welfare Department. A Soil Conservation Committee was created to deal with the setting-up of soil-conservation districts in connection with Federal and State provisions for maintaining the fertility of the soil. All employees of the University of California were admitted to the State's system of retirement for superannuated public employees. Provision was made whereby the State and its subdivisions might participate in the Federal financing of "low-cost" housing. The Senate, as in 1937, killed a House bill designed to pardon Thomas J. Mooney, convicted bomber.

Political and Other Events. The State was swept politically in the course of the summer by a new agitation for a high grant of public support to people of advanced years. This plan swept out of view the previously popular Townsend plan. More bountiful in its provisions, it captured the support of many of the latter's earlier friends. It proposed the State's paying, as its slogan said, "\$30 every Thursday" to every "retired" Californian 50 or more years of age; the State was to make the payments in scrip or warrants, which were to be transferable, and to which stamps at the rate of 2 cents on the dollar must be affixed every Thursday for a year, making the paper pay its own value at maturity. Campaigners for the scheme ascribed its theory to Dr. Irving Fisher of Yale; the liberal Aberhart government of Alberta, Canada, had given a

brief trial to a similar scheme, "prosperity certificates," two years before. The California movement, started in October, 1937, had reportedly among its early workers several recruits from the staffs of the Townsend and EPIC movements. Its quarters in Hollywood, once the proposal became known, were deluged with contributions by mail. A petition to put the scheme on the ballot to be voted as an initiated measure at the November election, was circulated; by mid-July it had nearly a million signatures—over five times the needful total. The movement became the most potent element in the year's political campaign (see *Elections*, below).

Business in the State was disturbed in the course of the year by the continued prevalence of strikes in some industries. Difficulties with longshoremen's labor organizations, centralized to some extent about San Francisco Bay but felt up and down the coast, impeded shipping activity in the winter and spring. The Alaskan Cannery Workers' Union struck before the sailing time of the salmon-fishery fleet from San Francisco and delayed the sailing of the ships until the closing days of May. A warehousemen's strike checked the movement of many sorts of goods in San Francisco and some other cities until settled early in August. See STRIKES AND LOCKOUTS.

The withdrawal of the ships of the Grace and Panama Pacific lines from the route between Atlantic and Pacific ports, carried out about the beginning of 1938, left the ports of California, particularly San Francisco, without regular connection with the ports of the eastern seaboard for several months. A strong organized effort was made to have the service restored. Eventually the Maritime Commission announced (June 9) that five vessels of the Baltimore Steamship Co. would be put on the route in July.

A long spell of heavy rains, beginning in January, caused floods in both northern and southern sections of the State. They became destructive by February 13. In low-lying areas of southern California additional rains caused widespread calamity at the beginning of March. An estimate of March 5, attributed to a representative of the Red Cross, put the expected total of resulting deaths at 400; damage was thought to approximate \$50,000,000. The Santa Ana River, bursting its banks at Riverside and in Orange County, caused much of the destruction, but the greater part of the harm occurred in scattered localities. So much did locality govern the effects that races were run at the Santa Ana race track at the height of the flood. Homeless persons maintained after the flood by the Red Cross and other agencies were reported to number 15,000. Devastation occurred chiefly in five counties: Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The city of Los Angeles did not suffer heavily, in proportion to its magnitude.

An investigation of asserted corruption among members of the Legislature was held, in public hearings, by a grand jury of Sacramento County; this was the first resort to a law passed in 1937 allowing public hearings by grand juries, on official malfeasance. The inquiry started on May 24; it elicited from Arthur H. Samish, an alleged lobbyist, copies of friendly letters and a photographic portrait from Governor Merriam and receipts for contributions to Merriam's campaign for election; but no evidence of illegal action on the Governor's part appeared. The Grand Jury ultimately considered and rejected proposals to indict two members of the Assembly for receiving money to vote

against a bill. It failed to indict Samish for perjury, he having denied in testimony that he had received \$10,000 from a film agency to work against a bill, whereas other testimony ran to the effect that he had received the money for this purpose. Samish was thereafter arrested on a charge of perjury and brought before a Police Judge at Sacramento, who refused to hold him.

The State had in preparation early in the year an application to the courts to declare it the possessor of the right to take petroleum from tidal lands; the proposed suit bore upon the practice of Los Angeles and Long Beach, both of which granted leases and received royalties. A third possible claimant to the tidal petroleum appeared when at Washington a resolution originating in the U.S. Senate and brought before the House of Representatives proposed that the Attorney-General sue to establish Federal title thereto; the resolution, disturbing to California, did not pass in 1938. In the field of public utilities, the Railroad Commission ordered (February, 7) reductions amounting to \$2,000,000 a year in the charges of the Pacific Gas and Electric and the San Joaquin Light and Power companies for natural gas. Ruling on a long conflict of the former company and the commission over a similar order issued in 1933, a Federal District Court held (September 8) that the company must repay about \$7,000,000 of charges collected in excess of rates after that order. Two officials of the State's agency regulating the petroleum industry were charged in August with conspiring to gain valuable petroleum lands in the Long Beach field.

Occurrences in Los Angeles. A so-called "citadel" of the open shop prior to the advent of Federal regulation of laboring conditions, Los Angeles had become by 1937 unionized only in part and subject to strife in the field of labor. Many employers had made bargaining agreements with employees' organizations; but some of these were independent unions, and some were "independent chartered unions" incorporated under State law and unable to become affiliated with any major combination of individual unions. The N.L.R.B. ruled against one of the incorporated unions in a decision (April 21) on a strike of February, 1937, against the Douglas Aircraft Co. at Santa Monica, near Los Angeles. It ordered strikers of a rival C.I.O. group, who had seized the factory and held it for three days, re-employed, with back pay, while the incorporated union of the non-striking workers, held to have been dominated by the employer, was ordered disbanded.

Efforts were carried on during the course of 1938 to investigate the spread of commercialized vice in Los Angeles and its alleged protection by persons in the police force. A private investigator engaged in collecting information on the subject narrowly missed being murdered (January 14) by the explosion of a bomb under the hood of his automobile. A captain and one of two lieutenants of police, brought to trial for the crime, were convicted and sentenced to prison for indeterminate periods (from a year to life). The Parker Dam, an element in the unfinished works of the Metropolitan Water District to bring water 392 miles from the Colorado River to Los Angeles and other cities, started its function of storing water (June 26). A petition for the recall of Mayor Frank L. Shaw brought the election of Fletcher Bowron as his successor; Bowron took office on September 26.

The Affairs of San Francisco. A Committee of 43, formed in the interests of employers, sought

during the year to promote a solution of difficulties with organized employees by stimulating a public sense of the community's interests. It held gatherings, called town meetings, at which the public attended and spokesmen for the C.I.O., for the Associated Farmers (unable in the labor troubles to bring produce safely into the city), and for other groups were heard. Many of the year's strikes, though not of a wholly local character, centered in San Francisco and caused more disturbance of business there than elsewhere. Trade was particularly hampered by interruptions caused by teamsters, warehousemen, and longshoremen, in conflicts involving rivalry between the C.I.O. and the A.F.L.

The effort of the Federal Department of the Interior to make the city give up selling electric current from the Hetch Hetchy water system through the Pacific Gas and Electric Co., was aided by a Federal District Court's decision (June 28) that this proceeding violated the Raker Act and an accompanying order to end such sales by December 28. The city made preparations to appeal, and Secretary Ickes was accused of threatening to hold back allocations from the PWA to the city in order to lead it to comply. The city also considered steps to satisfy the Federal demand by again submitting to popular vote a proposal to issue bonds for the cost of providing San Francisco with a municipal system of distribution for its electricity. The Board of Supervisors drew such a proposal but voted (September 23) to postpone submitting it until some date after the election of November 8. The plan called for an issue of \$55,000,000 of revenue bonds; the net receipts from sale of electric current through the agent company ran, as reported, about \$2,000,000 a year.

Plans to refinance the cost of the Bay Bridge, with the aid of the Reconstruction Finance Corporation, so as to save on the cost of amortizing the principal of about \$77,000,000, were approved by the Toll Bridge Authority (April 21). Arrangements were made in February to buy out the Southern Pacific's Golden Gate ferry service, which had been forced, by the competition of the Golden Gate Bridge, to lower its charges to a level tending to hurt the receipts from the bridge's tolls. The Market Street Ry., suffering from inadequate income, obtained from the State Railroad Commission an increase of the rate of fares to 7 cents (May 9), but traffic at the new rate declined, canceling the intended improvement of income. A proposal for municipal purchase of the line was rejected in a popular vote on November 8. The construction of buildings for the coming San Francisco exposition occupied thousands of men for most of the year, and expenditure was expected to exceed \$20,000,000.

Elections. At the general election on November 8, Sheridan Downey (Dem.) was elected U.S. Senator, defeating Philip Bancroft (Rep.); Culbert L. Olson (Dem.), elected Governor, defeated Gov. Frank F. Merriam (Rep.), who sought reelection.

Among measures submitted to the popular vote of the State, a plan for the regulation of labor was defeated; the proposal to pay retired persons 50 years or more of age \$30 weekly for support, in self-liquidating State scrip, as described earlier in this article, was rejected; a proposal to abolish the sales tax and allegedly, by language not plain to voters, to institute the Single Tax, was likewise rejected.

Downey, the Senator-elect, rode to victory by the

aid of the \$30-weekly-pension movement, though that movement itself failed. Presenting himself earlier in the year as a candidate in the Democratic primary, and particularly as an advocate of the scheme, he won a striking victory over Senator McAdoo, despite President Roosevelt's having traveled to California and made public declaration of his approval of McAdoo's record. Governor-elect Olson, frankly an advocate of the New Deal, was a declared and strong liberal; he had been associated with some of the phases of Upton Sinclair's EPIC movement.

Officers. California's chief officers, serving in 1938, were: Governor, Frank F. Merriam (Rep.); Lieutenant-Governor, George J. Hatfield; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Harry B. Riley; Attorney-General, U. S. Webb; Superintendent of Public Instruction, Walter F. Dexter.

Judiciary. Supreme Court: Chief Justice, William H. Wastie; Associate Justices, William H. Langdon, Douglas L. Edmonds, Jesse W. Curtis; Emmet Seawell, John W. Shenk, Frederick W. Houser.

CALIFORNIA, UNIVERSITY OF. A coeducational institution of higher learning with headquarters at Berkeley, Calif., founded in 1868. Campuses are found in various parts of the State. At Los Angeles, the University of California at Los Angeles, the Los Angeles Medical Department; at Mt. Hamilton is the Lick Observatory; at San Francisco, the California School of Fine Arts, Hastings College of the Law, Medical School, the George Williams Hooper Foundation for Medical Research, College of Dentistry, College of Pharmacy, Training School for Nurses; at Davis, a campus devoted chiefly to instruction and research by the College of Agriculture; at Riverside, the Citrus Experiment Station and the Graduate School of Tropical Agriculture; at La Jolla, the Scripps Institution of Oceanography.

The total number of resident students in the academic and professional departments, fall session, 1938, was 24,809, of whom 14,817 were men and 9992 were women. At Berkeley 15,633 were enrolled; at Los Angeles 7911. The enrollment in the University extension division, fall of 1938, was 14,765 in classes and correspondence courses. The 1938 summer-session enrollment (Berkeley and Los Angeles) totaled 6801. At the beginning of the fall semester there were approximately 2087 members on the regular teaching staff and 717 on the extension staffs. The total income for 1937-38 was \$14,701,487, including gifts totaling \$504,713 for current use. In addition, gifts were received totaling \$142,509 for plant, \$411,044 for endowment, and \$12,735 for loan funds. Total assets were listed at \$85,532,807 including \$52,626,492 in real estate, improvements, and equipment, and \$23,880,920 in endowment and trust funds. The libraries contained approximately 1,489,167 volumes. President, Robert Gordon Sproul, LL.D.

CALIFORNIA INSTITUTE OF TECHNOLOGY. An institution for collegiate and graduate instruction and research in the pure and applied sciences in Pasadena, Calif., founded as Throop University in 1891. The enrollment for 1938-39 was 868, of whom 606 were in the undergraduate and 262 in the graduate school. The faculty numbered about 200. The endowment was approximately \$10,000,000 and the annual income approximately \$875,000. There were 45,615 volumes in the library. Construction was completed on four new buildings. The institute has no president, the

administration centering in an executive council of nine, of which Robert A. Millikan, Ph.D., LL.D., Sc.D., is chairman.

CAMBODIA. See FRENCH INDO-CHINA.

CAMERAS. See PHOTOGRAPHY.

CAMEROON, kām'ēr-ōn', FRENCH. An autonomous territory, formerly part of the German territory of Kamerun, confirmed as a French mandate by the League of Nations in 1922. Area, 166,489 square miles; population (Jan. 1, 1937), 2,379,508, including 2383 Europeans, of whom 1799 were French. Yaoundé, the capital, had 20,000 inhabitants in 1936.

The chief crops, with production in metric tons, included: Maize, 34,200 (1936); sesame, 3500 (1934); groundnuts, 37,200 (1936). Exports of other leading crops, in metric tons, were: Cacao, 26,500 (1936); palm oil, 10,000 (1937 estimate); palm kernels, 17,300 (1937 estimate). The production of gold in 1937 was estimated at 500 kilograms. Other products are almonds, hides, timber, and ivory. Livestock in 1936: 747,553 oxen, 1,002,487 sheep, 176,204 pigs, 16,005 horses, and 18,627 asses. In 1937 the estimated value of merchandise imports (in old U.S. gold dollars) was \$5,400,000 (1936, \$4,500,000); exports, \$7,400,000 (1936, \$6,000,000). There are 3105 miles of roads and 314 miles of railway line. In 1937, 657 vessels of 1,523,992 tons entered and cleared the ports of Kribi, Campo, Garoua, and Douala. The general budget for 1936 indicated 62,765,145 francs for revenue and 57,785,174 francs for expenditure (franc averaged \$0.0611 for 1936). Public education was provided for to the amount of \$1,841,523 francs in the 1937 budget (franc averaged \$0.0405 for 1937). Government is vested in a commissioner aided by an administrative council. Commissioner, M. Boisson.

CAMEROONS, kām'ēr-ōnz', BRITISH. A part of the former German territory of Kamerun in West Africa, confirmed as a British mandate by the League of Nations in 1922. Area, 34,081 square miles; population (1937 estimate), 825,234. Victoria and Tiko are the two ports of entry. The principal products are palm oil, palm kernels, cacao, bananas, and rubber. In 1937 imports were valued at £328,270 (£242,588 in 1936); exports, £526,544 (£445,459 in 1936). During 1936, 264 vessels aggregating 486,281 tons entered and cleared the ports of Victoria and Tiko. For 1936-37, revenue totaled £125,075; expenditure, £173,092. The northern part of British Cameroons is attached to the Nigerian provinces of Adamawa, Benne, and Bornu; the southern part, known as Cameroons province, is attached to the Southern Provinces of Nigeria. Administration is under the governor of Nigeria.

CAMPBELL, WILLIAM WALLACE. An American astronomer and educator, committed suicide at San Francisco, June 14, 1938. Born in Hancock County, Ohio, Apr. 11, 1862, he was educated at the University of Michigan (B.S., 1886). Thereupon he went to the University of Colorado as a teacher of mathematics, but returned to Michigan two years later as an instructor in astronomy. His comet observations while director of the observatory there attracted wide attention and in 1890 he went to Mount Hamilton to engage in spectroscopic work.

In 1891 he was invited to become astronomer at Lick Observatory, and began a long association with that organization which ended with his retirement as astronomer emeritus in 1930. In 1900 he was acting director of the Observatory, becoming director in the following year and serving until 1930. From 1923 to 1930 he served as president of

the University of California, retiring as emeritus in the latter year.

During his long association with the Observatory, Dr. Campbell was in charge of eclipse expeditions to India, January, 1898; Georgia, May, 1900; Spain, August, 1905; Flint Island, January, 1908; Kiev, Russia, August, 1914; Goldendale, Wash., June, 1918; Walla, Western Australia, September, 1922; and also he served as a member of the expedition to Lower California in September, 1923.

Considered one of the world's foremost astronomers, Dr. Campbell was placed by Dr. Albert Einstein among the first of his profession to develop part proof of Einstein's relativity theory. Campbell's contribution was to prove, by means of photographs of eclipses of the sun, the correctness of Einstein's calculation of the bending of rays of light of stars coming past the sun. Dr. Campbell was himself the author of the first substantial catalogue of the radial velocities of stars, a result of his work as head of the department of spectroscopy at the observatory. His researches dealt particularly with comets and orbits, the motion of the solar system, and solar eclipse problems.

Silliman lecturer at Yale (1909-10), William Ellery Hale lecturer of the National Academy of Sciences (1914), and Halley lecturer at Oxford (1925), his work was recognized by numerous honors, including the Lalande prize (1903) and the Janssen Prize (1910) of the Paris Academy of Sciences; the gold medal of the Royal Astronomical Society (1906); the Draper Medal of the National Academy of Sciences (1906); and the Bruce gold medal (1915). Besides honorary degrees from American and foreign educational institutions he was a commander of the Order of Leopold (1919), an officer of the French Legion of Honor (1927), and commander of the Order of the Crown of Italy (1928). On Mar. 31, 1938, a symposium was held at Harvard University "in appreciation of the scientific contributions of Dr. Campbell."

He held membership in the world's outstanding scientific societies, and was president of the American Association for the Advancement of Science (1915), of the National Academy of Sciences (1931-35), of the American Astronomical Society (1922-25), and of the International Astronomical Union (1922-25). An associate editor of the *Astrophysics Journal*, he was the author of many papers on the motion of solar eclipses, stars, and comets, and of *The Elements of Practical Astronomy* (1899); *The Return of Halley's Comet* (1909); *Stellar Motions* (1913), and *Stellar Radial Velocities*, with J. H. Moore (1926).

CAMP FIRE GIRLS, Inc. An organization providing constructive leisure-time activities for 250,000 girls between the ages of 10 and 20, and, through the Blue Birds, the junior organization, for girls 8 to 10.

During 1938, Camp Fire Girls in every part of the country made real contributions in the field of conservation: Planting trees, charting water and soil erosion areas, co-operating with state and government agencies in research and construction activities, etc. This interest found its greatest expression in the conservation activities in and around the 128 Camp Fire Girls' camps, where thousands of girls spend many weeks both in winter and summer.

National Headquarters are at 41 Union Square, New York City.

CANADA. A Dominion of the British Commonwealth of Nations comprising nine provinces and two territories. Capital, Ottawa.

Area and Population. The land area, the census population of June 1, 1931, and the estimated population on June 1, 1938, are shown by provinces and territories in the accompanying table. The fresh-water area is about 228,070 square miles, making the total land and water area 3,694,863 square miles.

AREA AND POPULATION OF CANADA

Provinces and Territories	Land area, sq. miles	Population	
		1931	1938
Prince Edward Island	2,184	88,038	94,000
Nova Scotia	20,743	512,846	548,000
New Brunswick	27,473	408,219	445,000
Quebec	523,534	2,874,255	3,172,000
Ontario	363,282	3,431,683	3,731,000
Manitoba	219,723	700,139	720,000
Saskatchewan	237,975	921,785	941,000
Alberta	248,800	731,605	783,000
British Columbia	359,279	694,263	761,000
Yukon Territory	205,346	4,230	4,000
Northwest Territories	1,258,217	9,723	10,000
Total	3,466,556	10,376,786	11,209,000

The Indian population in 1931 was 122,920. Of the white population in 1931, 5,381,071 were of British origin (English, 2,741,419; Scottish, 1,346,350; Irish, 1,230,808; other, 62,494) and 2,927,990 of French origin. There were 5,374,541 males and 5,002,245 females. The principal religious groups in 1931 were: Roman Catholics, including 186,654 Greek Catholics, 4,285,388; United Church (Methodists, Congregationalists, and Presbyterians), 2,017,375; Anglicans, 1,635,615; Presbyterians (not included in United Church), 870,728; Baptists, 443,341; Lutherans, 394,194; Jewish, 155,614. Of the 2,927,990 Canadians of French origin in 1931, 2,849,096 were Roman Catholics.

In 1931, 4,804,728 inhabitants resided in rural districts and 5,572,058 in urban communities. Populations of the chief cities in 1931 were: Montreal, 818,577 (1,263,298 in 1938); Toronto, 631,207 (648,309 in 1938); Vancouver, 246,593; Winnipeg, 218,785 (215,814 in 1936); Hamilton, 155,547; Quebec, 130,594; Ottawa, 126,872; Calgary, 83,761 (83,407 in 1936); Edmonton, 79,197 (85,774 in 1936); London, 71,148; Windsor, 63,108; Verdun, 60,745; Halifax, 59,275; Regina, 53,209 (53,354 in 1936); Saint John, 47,514; Saskatoon, 43,291 (41,734 in 1936). Including suburbs, Montreal had 1,000,157 inhabitants in 1931 (1,443,588 in 1938); Toronto, 808,864 (855,235 in 1938); Vancouver, 308,340; Winnipeg, 280,202.

The number of immigrants into Canada in 1937 was 15,101 (11,643 in 1936). Of the 1937 total, 5555 came from the United States, 2859 from the British Isles (England, 890; Ireland, 338; Scotland, 581; Wales, 50), 1144 from the countries of northern Europe, and 5543 from 36 other countries. Living births in Canada, exclusive of the territories, totaled 220,371 in 1936 against an annual average of 228,352 for 1931-35. The crude birth rate stood at the comparatively high figure of 20.0 per 1000 in 1936. This was mainly due to the influence of Quebec, with its prolific French Canadian population. The Quebec birth rate was 24.3 per 1000 in 1936 against 16.9 per 1000 in Ontario. In the other provinces the rate varied from a low of 14.1 in British Columbia to a high of 24.2 in New Brunswick. Deaths in 1936 totaled 107,050, or 9.7 per 1000 of population, the same as the average rate for the years 1931-35.

Education. The illiteracy rate at the 1931 census was 7.2 per cent of the total population of five years and over, including 122,920 Indians, whose high illiteracy rate raised the general average. With

a total estimated population of 11,028,050 in 1936, there were 2,444,243 pupils enrolled in schools of all descriptions, including 2,222,891 in provincially controlled schools (2,127,796 in ordinary and technical day schools), 107,396 in privately controlled schools (89,892 in ordinary day schools), 18,033 in Dominion Indian schools, and 96,923 in universities and colleges (44,585 in courses of university standard). The total expenditure on educational institutions was \$140,359,083, divided as follows: Provincially controlled schools, \$114,685,037; privately controlled, \$4,969,000; Indian schools, \$1,936,744; universities and colleges, \$18,768,302.

Production. The Dominion Bureau of Statistics estimated the gross value of production in Canada for 1936 at \$4,933,384,000 (\$4,346,117,000 in 1935) and the net value at \$2,665,861,000 (\$2,369,064,000 in 1935). The gross value represents the total of all individual commodities produced, while the net value represents the value added in the process of production. Eliminating duplications represented in primary production, the net value of manufacturing production in 1936 was \$1,041,378,000, or 39.06 per cent of the total net production of the Dominion. Agriculture came second with a net production value of \$690,379,000 (25.9 per cent) followed by mining, \$291,972,000 (10.95); forestry, \$231,937,000 (8.7); electric light and power, \$133,561,000 (5.01); fisheries, \$34,234,000 (1.28). Primary production (\$1,391,298,000) accounted for slightly more than half the total value of all output. Secondary production consisted of manufactures; construction, \$135,851,000; custom and repair, \$97,333,700. Ontario accounted for 44.4 per cent of the net 1936 production; Quebec, 24.7 per cent; Prairie Provinces, 16.6; British Columbia and Yukon, 8.1; Maritime Provinces, 6.2. Of the male working population at the 1931 census, about 34 per cent were engaged in agriculture, 11 per cent in manufacturing, 7.6 per cent in transportation, and 6.2 per cent in building and construction. The average number of applicants for work registered by the employment exchanges in 1937 was 88,516 (90,133 in 1936).

Agriculture. The gross value of agricultural production in 1937 was estimated at \$1,051,698,000 compared with \$1,079,571,000 in 1936, \$766,794,000 in 1932, and \$1,631,081,000 in 1929. The value of the gross output in 1937 by chief items was: Field crops, \$553,823,000; dairy products, \$228,403,000; farm animals, \$140,989,000; poultry and eggs, \$51,766,000; fruits and vegetables, \$41,900,000; tobacco, \$17,056,000; fur farming, \$7,642,000; wool, \$2,972,000; clover and grass seed, \$2,298,000; honey and wax, \$2,272,000; maple products, \$2,245,000. The current value of farm capital in 1937 was \$4,722,583,000, of which land and buildings accounted for \$3,634,981,000; implements and machinery, \$478,454,000; live stock, \$609,148,000. About 163,500,000 acres were occupied as farms. Yields of the principal field crops in 1935, 1936, and 1937, with preliminary returns for 1938, are shown in the table in next column.

The gross farm value of production of the 1938 field crops was estimated at \$528,860,000 (preliminary) including: Wheat, \$205,351,000; oats, \$89,600,000; barley, \$28,373,000; rye, \$3,094,000; peas, \$2,113,000; beans, \$1,725,000; buckwheat, \$4,171,000; mixed grains, \$15,126,000; flaxseed, \$1,581,000; corn for husking, \$3,614,000; potatoes, \$27,079,000; turnips, etc., \$12,133,000; hay and clover, \$95,993,000; alfalfa, \$16,036,000; fodder corn, \$12,-

CANADIAN CROP YIELDS, 1935-38
[Units in thousands of bushels, except as indicated]

	1935	1936	1937	1938 ^a

^a Estimates. ^b 1,000 cwt. ^c 1,000 tons.

422,000; grain hay, \$7,315,000; sugar beets, \$3,124,000.

Manufacturing. In 1936 Canada had 24,202 industrial establishments representing a capital of \$3,271,263,531. They had 594,359 employees, paid salaries and wages of \$612,071,434, purchased materials valued at \$1,624,213,996, and reported a gross production value of \$3,002,403,814, of which \$1,289,592,672 was added in the process of production. Manufacturing is concentrated largely in the provinces of Ontario and Quebec. The net value of production by industrial groups in 1936 was: Wood and paper, \$261,020,034; vegetable products, \$254,135,013; iron and steel, \$211,572,641; textiles, \$162,677,272; non-ferrous metals, \$132,423,707; animal products, \$109,823,848; chemicals, \$69,854,217; non-metallic minerals, \$68,707,776; miscellaneous manufactures, \$19,378,164.

The gross value of the iron and steel output in 1937 was \$623,359,000 (\$453,385,000 in 1936). The capacity of hydro-electric turbine installations increased from 3,191,852 h.p. in 1923 to 8,112,751 h.p. on Jan. 1, 1938, while the total potential horse power available in the Dominion was estimated at 43,700,000 h.p. The output of central electric stations in 1937 amounted to 27,574,926,000 kilowatt-hours, or 8.6 per cent above the 1936 record. A total of 207,000 motor vehicles were manufactured in 1937 (162,159 in 1936). Production of newsprint in 1937 was 3,645,300 tons (3,179,900 in 1936).

Mineral Production. The value of mineral production in 1937 was \$457,359,092, of which metals accounted for \$334,165,243, non-metallic fuels for \$65,828,879, other non-metallics for \$22,495,271, clay products for \$4,516,859, and other structural materials for \$30,352,840. The quantity and value of the chief minerals produced in 1937 was: Gold, 4,096,213 fine oz., valued at \$84,676,235 at standard rate (estimated exchange equalization on gold produced, \$58,650,258); copper, 530,028,615 lb., \$68,917,219; nickel, 224,905,046 lb., \$59,507,176; coal, 15,835,954 tons, \$48,752,048; lead, 411,999,484 lb., \$21,053,173; zinc, 370,337,589 lb., \$18,153,949; asbestos, 410,026 tons, \$14,505,791; natural gas, 32,380,991 M cu. ft., \$11,674,802; sand and gravel, 27,001,301 tons, \$10,492,696; cement, 6,168,971 bbl., \$9,095,867; silver, 22,977,751 fine oz., \$10,312,644; platinum, 139,377 fine oz., \$6,752,816; petroleum, crude, 2,943,750 bbl., \$5,399,353.

Forests. Of Canada's total area of 3,466,556 square miles, forests cover 1,223,522 square miles, including 769,463 square miles of accessible and productive forest area. The total stand of timber was estimated in 1936 at 273,656 M cu. ft. In the same year the total cut was equivalent to 2,702,766 M cu. ft., valued at \$134,804,228. The value of output of the lumber industry in 1936 was \$80,343,000 (\$65,905,000 in 1935). There were 3638 lumber mills with 28,760 employees receiving salaries and wages of \$21,357,000 and using materials costing \$43,598,000. The production of sawn lumber was 3,412,151,000 ft. board measure valued at \$61,965,-

000. Pulpwood production was 289,000 cords, valued at \$2,118,000; railway ties, 5,191,000, valued at \$2,590,000.

Fisheries. The value of production of commercial fisheries in 1937 was \$38,976,294 (preliminary figure), compared with \$39,165,055 for 1936. The total quantity of fish of all kinds, including shell fish, caught and landed by Canadian fishermen during 1937 was 10,918,048 cwt., and the value at the point of landing was \$23,194,642 (11,088,289 cwt., valued at \$22,083,550 in 1936). The principal kinds of fish caught, in order of value, were: Salmon, \$12,370,219; lobster, \$4,633,429; cod, \$3,140,230; herring, \$2,556,883; whitefish, \$1,887,889; halibut, \$1,598,190; sardines, \$1,526,505; haddock, \$1,296,313; pickerel, \$1,043,532; trout, \$1,031,740. The number of persons employed in the fisheries in 1937 was 83,850, of whom 69,967 were men employed on fishing boats.

Fur Production. Canada's raw fur production for the year ended in June, 1937, was valued at \$16,666,000, the highest figure since 1928-29. Furs from fur farms represented about 40 per cent of the total value, the remainder coming from animals taken by trappers. Included in the total were 204,388 silver fox pelts (produced mainly on fur farms), valued at \$5,986,000; muskrat, \$2,249,000; mink, \$2,240,000; ermine, \$816,879; red fox, \$716,152; beaver, \$698,939; marten, \$642,307; lynx, \$605,491; patch or cross fox, \$516,182; coyote or prairie wolf, \$458,489; squirrel, \$386,743; fisher, \$271,482; white fox, \$271,288; otter, \$227,776. Ontario, Quebec, and Alberta in the order named are the leading fur-producing provinces. In 1936 Canada had 8141 fur farms stocked with animals valued at \$9,837,813.

Tourist Trade. Expenditures of foreign tourists in Canada during 1937 were estimated at \$294,682,000, of which tourists from the United States spent \$294,682,000, while expenditures of Canadian tourists in foreign countries were \$124,422,000 (\$102,087,000 in the United States). In 1936 total expenditures of foreign tourists in Canada were \$251,299,000 (\$238,353,000 by visitors from the United States) and expenditures by Canadian tourists abroad were \$110,400,000 (\$89,064,000 in the United States).

Foreign Trade. Canadian foreign trade by recent fiscal years ending March 31 is shown in the accompanying table.

CANADIAN IMPORTS AND EXPORTS
[In thousands of Canadian dollars]

Years ended March 31	Total exports	Total imports	Excess: Imports (-) Exports (+)
1929-30	1,144,938	1,248,274	-103,336
1932-33	534,978	406,384	+128,594

1937-38 ^a	1,084,821	799,070	+285,751

^a Preliminary figures.

The value of the 14 chief commodities imported in 1937-38 was: Machinery, except farm, \$48,367,372; crude petroleum, \$47,634,720; coal, \$38,907,709; iron plates and sheets, \$31,487,270; automobile parts, \$29,725,252; farm implements and machinery, \$19,245,768; raw cotton, \$17,444,618; sugar for refining, \$17,340,403; fresh fruits, \$16,546,947; vegetable oils, \$15,828,491; automobiles, \$15,644,461; electric apparatus, \$15,550,125; books and printed matter, \$14,959,310; crude rubber, \$14,729,016. The principal 1937-38 exports by value

were: Newsprint paper, \$120,007,550; wheat, \$116,273,709; gold bullion, non-monetary, \$86,203,736; nickel, \$61,918,600; copper bars, rods, etc., \$45,674,426; planks and boards, \$43,662,909; meats, \$41,362,775; wood pulp, \$39,960,178; fish, \$26,283,313; automobiles, \$25,299,363; wheat flour, \$23,221,366; aluminum in bars, \$20,748,973; whiskey, \$18,828,293; zinc, \$16,059,164; lead, \$14,115,946; raw furs, \$13,998,235.

The United States supplied 61 per cent of Canada's 1937-38 imports by value (58.6 per cent in 1936-37) and took 39.5 per cent of the exports (41 in 1936-37). The United Kingdom supplied 18.1 per cent of the imports (19.3 per cent in 1936-37) and took 38.3 per cent of the exports (38.4 in 1936-37). The value of imports from leading sources of supply in 1937-38 was: United States, \$487,307,000; United Kingdom, \$145,000,000; British Straits Settlements, \$15,586,000; Australia, \$12,171,000; Germany, \$11,397,000; British India, \$9,405,000; British South Africa, \$8,394,000; Belgium, \$7,462,000; New Zealand, \$7,397,000; France, \$6,489,000. The distribution of Canadian exports by chief markets in 1937-38 was: United States, \$423,131,000; United Kingdom, \$409,412,000; Australia, \$32,422,000; Japan, \$26,640,000; British South Africa, \$16,169,000; New Zealand, \$16,031,000; Belgium, \$14,564,000; Netherlands, \$13,269,000; Germany, \$12,254,000; Newfoundland, \$9,389,000.

Finance. The accompanying table shows the total Dominion budget receipts, ordinary expenditures, and total expenditures for the period 1934-35 to 1938-39.

DOMINION FINANCES: 1934-35 TO 1938-39
[Thousands of Canadian dollars]

Years ended March 31	Total revenues	Ordinary expendi- tures	Total expendi- tures	Surplus (+) or deficit (-)
1934-35	\$361,973	\$359,701	\$478,106	-\$116,133
1935-36	372,596	372,539	532,585	- 159,990
1936-37	454,154	387,112	532,005	- 77,851
1937-38 ^a	516,692	410,954	530,467	- 13,775
1938-39 ^b	501,700	524,600	- 22,900

^a Preliminary. ^b Estimates.

The total public debt of the Dominion on Mar. 31, 1938, was \$3,536,300,000 (funded debt, \$3,252,578,000), compared with a total on Mar. 31, 1937, of \$3,542,521,126 (funded, \$3,337,358,832). Deducting assets, the net debt on Mar. 31, 1938, was \$3,097,727,000 (\$3,083,952,202 on Mar. 31, 1937).

Shipping. In the fiscal year ended Mar. 31, 1937, a total of 25,348 sea-going vessels of 31,145,065 register tons entered Canadian ports with 11,142,357 tons of cargo and 26,136 vessels of 31,802,946 register tons cleared with 15,791,269 tons of cargo. In the coastwise trade, 73,033 vessels of 45,973,830 register tons arrived at Canadian ports and 72,739 vessels of 45,447,342 register tons departed. The tonnage of all vessels cleared from the leading ports in 1936-37 was: Vancouver, 11,824,810; Montreal, 8,961,002; Victoria, 6,793,818; Halifax, 4,252,636; Quebec, 4,186,314; Port Arthur, 3,546,336; Toronto, 3,364,880.

Railways, etc. The mileage of steam railways in operation on Jan. 1, 1937, was 42,552, giving Canada fourth place among the countries of the world in railway mileage. There are two main railway systems—the privately owned Canadian Pacific Railway, with 17,223 miles of single track, and the government-owned Canadian National Railway, with 21,736 miles. In the calendar year 1936, the steam railways carried 20,497,616 pas-

sengers and 75,846,566 tons of freight. Gross earnings totaled \$334,855,579 and operating expenses were \$283,399,255. In 1937 the gross earnings of the Canadian Pacific Railway were \$145,085,558; operating expenses, including taxes, were \$121,343,311; and net earnings were \$23,742,247.

Canada in 1936 had 410,448 miles of highways, of which 9832 miles were surfaced, 88,229 miles were gravel and stone, and 311,098 miles were earth roads. Automobiles numbered 1,234,071 in 1937. Civil aviation statistics for 1937 were: Aircraft hours flown, 126,550; aircraft mileage, 10,626,630; passengers and crew carried, 160,517; freight and express, 26,205,766 lb.; mail carried, 1,411,213 lb.

Government. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry. Legislative power rests in a parliament of two houses—a Senate of 96 members appointed for life by the Governor-General on advice of the Cabinet and a House of Commons of 245 members elected for five years (unless the government is sooner dissolved) by popular male and female suffrage. The nine provinces enjoy a large measure of local autonomy, there being a separate parliament and administration for each. A lieutenant-governor appointed by the Governor-General-in-Council heads each provincial executive. Governor-General in 1938, John Buchan (Lord Tweedsmuir of Elsfield), assumed office, Nov. 2, 1935.

The election of Oct. 14, 1935, resulted in a victory for the Liberal party and a Liberal cabinet was appointed Oct. 23, 1935. The standing of the parties in the House of Commons on Jan. 27, 1938, was: Liberals, 178; Conservatives, 38; Social Credit, 17; Co-operative Commonwealth Federation, 7; Reconstruction party, 1; other groups, 2; vacancies, 2.

The members of the cabinet, in 1938, according to precedence of the Ministers, were: Prime Minister, President of the Privy Council, and Secretary of State for External Affairs, William Lyon Mackenzie King; Minister without Portfolio, Raoul Dandurand; Minister of Mines, Immigration and Colonization, Interior, and Superintendent General of Indian Affairs, Thomas Alexander Crerar; Minister of Justice and Attorney-General, Ernest Lapointe; Public Works, Pierre Joseph Arthur Cardin; Finance, Charles Avery Dunning; Postmaster General, John Campbell Elliott; Trade and Commerce, William Daum Euler; Secretary of State, Fernand Rinfret; National Defense, Ian Alistair Mackenzie; Pensions and National Health, Charles Gavan Power; National Revenue, James Lorimer Ilsley; Fisheries, Joseph Enoil Michaud; Labor, Norman McLeod Rogers; Transport, Clarence Decatur Howe; Agriculture, James Garfield Gardiner.

HISTORY

Efforts at Constitutional Reform. The constitutional issue raised by the invalidation of the former Bennett Government's "new deal" social and economic legislation in 1936 and 1937 (see 1937 YEAR BOOK, pp. 124 f.) assumed increasing gravity during 1938. The Canadian Supreme Court and the Judicial Committee of the British Privy Council had denied the Dominion government power to deal effectively with nation-wide social and economic problems. But the need for governmental intervention was increasing as a result of the trend toward large-scale production, monopolies, centralized control of industry and finance,

unionization and collective bargaining, unequal distribution of income, and unemployment.

The necessity for constitutional reform in order to promote and preserve national unity was recognized by all political parties. In August, 1937, Prime Minister Mackenzie King appointed a Royal Commission on Dominion-Provincial Relations to explore the problem and make recommendations. Its investigations during 1937 and 1938 served to emphasize the fact that the economic depression had intensified sectional rivalries and dissensions among the provinces to a point where they seriously threatened national unity.

The Dominion government's effort to extend its powers at the expense of provincial autonomy was bitterly opposed by the dominant political groups in Ontario and Quebec but was supported by most of the maritime and prairie provinces. In Quebec, French Canadian nationalism and the Roman Catholic Church had always staunchly defended the autonomous powers conferred on the provinces by the British North America Act. Moreover, the dominant industrial and financial interests in Ontario and Quebec felt that their position was jeopardized by the Dominion Government's desire to deal with national problems on a national scale. They strongly opposed the allocation of taxes raised in their provinces by the Dominion Government to the more needy prairie and maritime provinces. The outlying provinces, on the other hand, asserted that Federal tariff, transportation, and banking policies had promoted the centralization of industry and finance in Ontario and Quebec at their expense. They held it only just that part of the taxes raised in Ontario and Quebec should be distributed for unemployment relief and for education, health, and social services in the other provinces.

The crucial nature of sectional economic and political differences was repeatedly emphasized by developments of the year. The Dominion Government late in 1937 attempted to secure the consent of all nine provinces to a constitutional amendment authorizing the Federal Parliament to establish a nation-wide unemployment insurance system. Alberta and New Brunswick joined Quebec and Ontario in refusing to do so. Premier Aberhart, Social Credit leader of Alberta, withheld all co-operation with the Federal government after the latter refused to sanction the establishment of a separate economic and financial set-up in his province (see ALBERTA under *History*). Premier Duplessis of Quebec flatly refused to recognize the authority of the Royal Commission—popularly known as the Rowell Commission after its chairman, Chief Justice Newton W. Rowell of Ontario. On August 11, Premier Mitchell Hepburn of Ontario ended all co-operation between his government and the Rowell Commission. These developments led Prime Minister Mackenzie King to announce a general election for 1939 on the issues of national unity and constitutional reform.

Economic Issues. Behind the constitutional crisis and the confused political situation was the clash of sectional and class interests over the tariff, the railways, and the banking system. The farming, fishing, and raw material producing industries, concentrated mainly in the maritime and prairie provinces, continued to agitate for even lower tariffs than those fixed by Mackenzie King's Liberal Government. The manufacturing and union labor elements, strong in Quebec and Ontario, demanded higher tariffs to encourage manufacturing and high wages.

There was a somewhat similar line-up of eco-

economic interests on the issue of merging the Canadian National Railways with the Canadian Pacific and eliminating surplus trackage. This solution was favored by the Canadian Pacific system, which estimated the annual savings at \$75,000,000, and was supported by the industrial and financial interests of Quebec and Ontario, resentful of the heavy cost of the government-owned Canadian National system. It was opposed by the outlying provinces and producers of raw materials and foodstuffs, who feared the consequences of a privately owned railway monopoly and adverse economic effects from a reduction in trackage.

Similarly, agricultural interests in the prairie provinces insisted that the Bank of Canada issue new money for public works and slum clearance through reduction in the gold backing of the national currency while the industrial and financial interests vigorously opposed this proposal. Apparently as a political move designed to meet criticism of the government's monetary policy by radicals and Left-wing Liberals, the Mackenzie King Government secured the passage of legislation, approved July 1, completely nationalizing the Bank of Canada and reducing its capital from \$10,100,000 to \$5,000,000.

Other economic issues that became the source of political controversy were the export of power from Ontario and Quebec to the United States, desired by the two provincial governments but opposed by Prime Minister King on the ground that it might disturb Canadian-American relations; the Dominion Government's guarantee of an 80-cent minimum price for the 1938 wheat crop; the low-cost and low-rental housing program adopted by Parliament in June, authorizing the Federal Government and the mortgage companies to advance up to 90 per cent of the loan value of new homes; the Great Lakes-St. Lawrence seaways and power project, revived by the United States Government in a new draft treaty submitted in May, 1938, but opposed by the provincial governments of Ontario and Quebec; and the special \$100,000,000 public works program adopted early in 1938 as an additional unemployment relief measure.

Political Developments. Meanwhile extensive political realignments were taking place in anticipation of the 1939 elections. The economic and political conflicts affecting all phases of Canadian life were reflected in both of the major political parties. Prime Minister Mackenzie King's cabinet itself was divided on the tariff, relief, budget, and other issues.

The Liberal electoral sweep of preceding years was continued in the Saskatchewan elections of June 8, 1938. The Liberals of that province, led by Premier W. J. Patterson, captured 36 out of 52 contested seats, against 10 seats won by the Co-operative Commonwealth Federation, 2 by Social Credit candidates, and 4 by other scattered groups. The Conservatives captured not a single place. But the conflict within the Dominion Liberal party that began in 1937 between Prime Minister Mackenzie King on the one hand and Premiers Hepburn of Ontario and Duplessis of Quebec on the other developed in intensity.

The Hepburn-Duplessis alliance opposed the Dominion Government on such issues as the St. Lawrence waterway, the export of electric power to the United States, constitutional reform, and social legislation. It also fought the unionization of the mining and manufacturing industries of the two provinces and attacked the Prime Minister for his refusal to join actively in suppressing the C.I.O.

invasion, which got under way in 1937 (see 1937 YEAR BOOK, p. 126). With the support of conservative and extreme nationalist elements, Hepburn was believed to be in a position to challenge Mackenzie King's leadership of the Liberal party in 1939.

Dr. Robert James Manion of Fort William, Ont., Minister of Railways in Prime Minister R. B. Bennett's last Cabinet, was elected Mr. Bennett's successor as leader of the Conservative party at its national convention in Ottawa in July. He was the second Roman Catholic to lead the party since confederation. Policies approved by the convention included the exclusion of Oriental immigration, further immigration from the United Kingdom and France when economic conditions warranted it, a national unemployment insurance and retirement system, continued tariff protection for all Canadian industries, reduced taxation on the mining industry, and co-operation with other members of the British Commonwealth of Nations on defense matters. A minority led by W. D. Herridge, brother-in-law of Mr. Bennett and former Minister to Washington, sought unsuccessfully to win the party to a program of radical reform. Their secession from the Conservative ranks was expected.

Among the other parties, the Co-operative Commonwealth Federation, a Socialist farmer-labor party, showed signs of growing popularity. It held seven seats in the Dominion Parliament and 20 in Western legislatures. The Social Credit movement, led by Premier Aberhart of Alberta, appeared to be on the decline following the failure of its vigorous effort to capture the Saskatchewan Legislature in the June elections and a series of other set-backs (see ALBERTA under *History*).

Early in July scattered Fascist groups throughout Canada were merged into a new party called the National Unity Party, led by Adrien Arcand, a Montreal editor and business associate of Premier Duplessis of Quebec. The party program called for the overthrow of democracy, state control of sources of wealth and propaganda, and repression of Freemasons, Communists, and Jews. Its leaders proclaimed loyalty to the King and country. They announced that they would enter candidates in the next general election. Meanwhile the Duplessis government in Quebec was showing strongly pro-Fascist tendencies (see QUEBEC under *History*). There were a number of clashes between Fascist and anti-Fascist groups during the year and it was charged that the Fascists in Quebec were arming.

Canada in the Empire. The Liberal Government during 1938 pursued the negative and uncertain policy with respect to Empire and foreign relations that appeared to be dictated by the Dominion's acute sectional, racial, and religious differences and by its geographical isolation. Even in the face of the mounting war clouds in Europe, it refused to acknowledge commitments to the British Commonwealth of Nations or to the League of Nations while also refusing to proclaim its unconditional neutrality and isolation.

Prime Minister Mackenzie King told the House of Commons at Ottawa on May 24 that his government's foreign policy consisted of minding its own business to the extent permitted by its obligations as a member of the British Commonwealth and League of Nations. He declared the sanctions articles of the League Covenant had ceased to have effect so far as Canada was concerned, and that as a member of the British Commonwealth Canada had no commitment either to go to war or to stay neutral. That decision, he said, would have to be

made by the Dominion Parliament which was not bound by policies adopted in London. Yet in a legal sense the Statute of Westminster did not grant the Dominion the right to declare its neutrality in a British war and consequently it would automatically become a belligerent from the viewpoint of British and international law. The government hesitated to clear up this legal impediment to its declared policy for fear that any hint of dissension within the British Commonwealth might weaken the British position in Europe and the Far East.

Developments during the year indicated that Canada would have difficulty in avoiding involvement in any prolonged or serious British conflict. The existing economic, political, and sentimental ties with the mother country were reinforced by large British purchases of Canadian wheat and munitions. In March the British Government placed orders for the manufacture of machine guns and airplanes in Canada. Soon afterward it suggested that it be permitted to establish military flying schools in Canada for the training of the numerous Canadian recruits to the Royal Air Force, theretofore trained in Great Britain.

The Mackenzie King Government replied that "in Canadian territory there could be no military establishments except those owned, maintained and controlled by the Canadian Government." This stand was bitterly attacked by former Prime Minister Richard B. Bennett, Conservative party leader, in the House of Commons at Ottawa on July 1 and by ex-Prime Minister Arthur Meighen, Conservative leader in the Senate, a few days later. They both emphasized the necessity for Canada to help Britain in developing the means for protecting not only Great Britain but the entire British Commonwealth. The issue was amicably settled through an agreement under which the Canadian Government agreed to provide facilities in Canada for the training of Royal Air Force recruits. These facilities were to belong to the Canadian Air Force, controlled by the Canadian Minister of National Defense. Once the recruits completed the training requirements of the R.A.F. they were to be transferred to Great Britain.

Late in July a British Air Mission arrived in Canada and on September 2 it announced at Ottawa that arrangements had been completed with leading Canadian manufacturers, backed by prominent financial organizations, for the long-range purchase of air bombers for the British Government. The airplane manufacturers were to expand the existing capacity of their plants and two new factories were to be established at Montreal and Toronto. Later, arrangements for the manufacture of other types of military planes were completed.

The crucial test of Canada's relationship with Great Britain came with the development of the Czecho-Slovak crisis in Europe in September. With Britain on the brink of war with Germany, pro-British organizations throughout Canada demanded that the government make known whether or not it intended to enter the conflict on Britain's side if hostilities commenced. Prime Minister Mackenzie King replied on September 17 that his government did "not consider, in the light of all the circumstances known to us, that public controversy as to action in hypothetical contingencies would serve the interests of peace or commonwealth unity." He announced that Parliament would be convened immediately to decide Canada's course if peace efforts failed. This policy was maintained until the crisis passed. While there seemed little doubt but what Parliament would have voted for military support

of the British cause, it was equally plain that such a policy was not favored by the French-Canadians. Some French-Canadian spokesmen insisted that they would resist any attempt at national conscription by armed force.

Meanwhile the threatening international situation led Canada to increase military and naval appropriations from \$17,000,000 in 1936-37 to \$36,000,000 in 1937-38 and \$34,000,000 in 1938-39. Plans were adopted for new air bases at Aliford Bay, Queen Charlotte Islands, Patricia Bay, and Prince Rupert on the Pacific, and at Dartmouth, Sydney, Truro, and Yarmouth on the Atlantic.

Relations with United States. Canada's relations with her southern neighbor were cemented by new commercial and political ties. A new Canadian-American reciprocal trade treaty was signed in Washington on November 17 at the same time as the Anglo-American trade pact, which vitally affected Canada's trade with both Britain and the United States. The Canadian-American treaty greatly extended the benefits enjoyed by both countries under the 1936 treaty. Canada removed a special 3 per cent import tax on articles otherwise free or dutiable, which comprised 67 per cent of the total imports from the United States, and granted new concessions on many American manufactures, including automobiles. The United States in turn reduced or bound its duties on many Canadian agricultural, livestock, and fishery products. Canada sacrificed the whole of the British preference on Canadian wheat as well as one-third of the preference on Canadian apples and pears to facilitate the Anglo-American agreement. The Canadian-American treaty entered into effect Jan. 1, 1939, for three years, after which it might be terminated on six months' notice by either party.

On May 31, 1938, Secretary of State Hull submitted to the Canadian Government a new draft treaty for the development of navigation and power facilities of the Great Lakes-St. Lawrence waterway. A previous treaty signed by the two governments in 1932 had failed of ratification in the U.S. Senate. Under the new Hull proposals, the United States would proceed immediately with development of the International Rapids section of the waterway, paying the entire initial cost estimated at \$225,000,000. Canada would be allowed until 1949 to begin construction of its hydroelectric plants, while those in the United States would be constructed immediately. An international commission would be established to supervise construction along the St. Lawrence and the power and scenic developments at Niagara Falls. The proposed 27-foot channel around the International Rapids would permit ocean-going vessels to proceed inland as far as Duluth.

On March 21 the United States had rejected a Canadian request, inspired by Premier Hepburn of Ontario, for a separate treaty authorizing the diversion of water in the Albany River valley for purposes of power production. Premier Hepburn hoped thus to increase the export of Ontario's surplus electric power to the United States. The United States opposed any increase in power imports from Canada because curtailment of the supply, especially in case of war, might impair many national defense industries. Secretary Hull therefore stated that the Albany River development "should be dealt with as part of a general settlement of the problem of the entire Great Lakes-St. Lawrence basin."

Premier Hepburn, however, opposed the waterways project on the ground of expense, damage to Canadian railways, the creation of excess electric

power, and invasion of provincial rights. On September 22 he refused Prime Minister Mackenzie King's invitation to co-operate in the technical study of the St. Lawrence project as it affected power development in Ontario. His fight against the project was supported by Premier Duplessis of Quebec, who was anxious to protect Montreal's position as the chief port on the St. Lawrence. Consequently the future of the project depended to a large degree upon the outcome of the 1939 elections.

President Roosevelt, making his third visit to Canada on August 18, made two important speeches bearing upon Canadian-American relations. At Kingston, Ont., where he received an LL.D. degree from Queen's University, he declared: "The Dominion of Canada is part of the sisterhood of the British Empire. I give to you assurance that the people of the United States will not stand idly by if domination of Canadian soil is threatened by any other empire." This was taken to mean that the United States, by protecting Canadian ports and islands from invasion during a war involving Great Britain, would thereby make it possible for Britain to receive vital supplies of Canadian raw materials, foodstuffs, and munitions.

In his second speech, dedicating the Thousand Islands Bridge across the St. Lawrence River, the President urged the Canadian people to join in the St. Lawrence waterway and power project. He declared the waterway would make every city on the Great Lakes an ocean port and increase rather than decrease railway traffic. He also urged public ownership and operation of the river's navigation and power resources.

Canada and the United States also found their interests linked in opposing the inroads of Japanese fishermen upon the salmon fisheries of British Columbia and Alaska. Agitation for the complete exclusion of Japanese also developed in British Columbia, whose representatives complained that large numbers of Japanese were being smuggled into the province. At the insistence of the Mackenzie King Government, the Dominion Parliament defeated two bills prohibiting Japanese immigration. However, the Dominion government named a committee to investigate the friction caused by the presence of some 22,205 Japanese in British Columbia.

See the separate articles on the provinces and territories.

CANADA, THE UNITED CHURCH OF. The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. Foreign mission work is carried on in Japan, Korea, China, India, Trinidad, and Angola (West Central Africa). In 1937 there were in Canada, Newfoundland, and Bermuda 7423 preaching places (including home missions) in 2833 pastoral charges, 698,738 communicant members, and 1,729,248 persons under pastoral care. A total amount of \$11,500,000 was raised for all purposes. At the Eighth General Council held in Toronto, Ont., in September, 1938, the Rev. John W. Woodside, M.A., D.D., was chosen moderator for the ensuing biennium. Rev. Gordon A. Sisco, M.A., D.D., is general secretary. Headquarters are at 421 Wesley Building, Toronto, Ont.

CANARY ISLANDS. A group of islands off the northwest coast of Africa, forming two provinces of Spain. (1) Las Palmas (comprising the islands of Gran Canaria, Lanzarote, Fuerteventura,

and the islets of Alegranza, Roque del Este, Roque del Oeste, Graciosa, Montaña, Clara, and Lobos), area, 1279 square miles; population (1935), 270,033; capital, Las Palmas (83,553 inhabitants) on Gran Canaria. (2) Santa Cruz de Tenerife (comprising the islands of Tenerife, Palma, Gomera, and Hierro), area, 1528 square miles; population (1935), 329,679; capital, Santa Cruz de Tenerife (66,429 inhabitants). In 1937 there were 653 miles of roads.

CANONIZATIONS. See ROMAN CATHOLIC CHURCH.

CANTON ISLAND. A coral atoll (2° 49' S. and 171° 43' W.) in the Phoenix group of the Pacific, midway between Fiji and Hawaii. The atoll, almost an exact circle of 29 miles in circumference, has a land mass of from 50 to 600 yards wide which surrounds a circular lagoon of 9 miles in diameter. Canton was claimed by both the United States and Great Britain. It has great value as a base for seaplanes in the development of transpacific airlines. Great Britain, by an Order-in-Council of Mar. 18, 1937, incorporated the Phoenix group (including Canton) in the Gilbert and Ellice Islands colony. On Mar. 3, 1938, President Roosevelt signed an executive order which laid formal claim to Canton and Enderbury islands of the Phoenix group. During August, 1938, it was announced in Washington that Great Britain and the United States had agreed to leave in abeyance for a protracted period of time the question of title, concerning themselves only with that of use. They agreed to set up a regime assuring equality of facilities to their respective nations in the field of international aviation and communications (Anglo-U.S.A. Pact, Aug. 10, 1938).

CAPEK, kă'pěk', KAREL. A Czech author, died at Prague, Czechoslovakia, Dec. 25, 1938. Born at Malé Syatonovice, Bohemia, Jan. 9, 1890, he was educated at Caroline University, Prague, the University of Berlin, and the Sorbonne, completing his studies in 1915. With his brother Joseph he wrote many short stories, which were later published under the title of *Radiant Depths*. He became associated with the newspaper *Lidové Noviny* in 1917, and after the World War became a producer for the Municipal Theater, Prague. Subsequently he established his own theater, the Vinohradsky, where the first performance of Shelly's *Cenci* was given.

Although a writer of essays and fiction, Capek was chiefly known as a dramatist, particularly for his satiric melodrama, *R.U.R.* (*Rossum's Universal Robots*), which was written in 1920 and produced in New York in 1922. It was this play that gave the word "robot" to the English language. Another of his well-known dramatic works was *The World We Live In* (1921), written with his brother. This, an arraignment of human life, became known as the "Insect Play" because the characters were all insects. His most recent play was *The Mother* (1938).

Among Capek's works may be noted *Anthology of French Poetry*; *The Robber*, a comedy (1918); *The Macropulos Affair*, a comedy (1922); *English Letters* (1925); *About the Nearest Things* (1926); *Money and Other Stories* (1929); *Talks with Masaryk* (i, 1929, ii, 1930); *Letters from Spain* (1930); *Sketches from Holland* (1932); *About the Common Things* (1932); *Intimate Things* (1935); *An Ordinary Life*, a novel (1936); *War with the Newts*, a novel (1936); *Power and Glory*, a play (1937); *The First Gang*, a novel (1937); *White*

Malady, a play (1937); *Masaryk on Thought and Life* (1938).

CAPE OF GOOD HOPE. See SOUTH AFRICA, UNION OF.

CAPE VERDE (vürd) **ISLANDS.** A dependency of Portugal, 320 miles west of Cape Verde, French West Africa. The islands comprise the Barlavento (windward) group (São Vicente, Santo Antão, São Nicolau, Santa Luzia, Sal, Boavista, Branco, and Raso) and the Sotavento (leeward) group (Santiago, Maio, Fogo, Brava, Rei, and Rombo). Total area, 1557 square miles; population (1936 estimate), 163,000, of whom about 5992 were Europeans. Praia (capital) had 6000 inhabitants in 1934.

The main products are sisal, castor oil, coffee, maize, mustard, brandy, oranges, and hides. The production of maize in 1935 was 11,000 metric tons. In 1935 coffee exports totaled 59 metric tons. In 1935 imports were valued at 51,012,221 escudos (special commerce); exports, 3,107,932 escudos (special commerce). A total of 3911 ships (3,695,742 tons) entered, and 3885 ships (3,693,092 tons) cleared the ports. The estimated revenue for 1937 totaled 17,311,180 escudos; expenditure, 17,098,689 escudos; on Dec. 31, 1937, the public debt totaled 17,137,225 escudos (escudo averaged \$0.0448 for 1937). The government of the dependency is administered by a governor.

CARDOZO, kār-dō'zō, BENJAMIN NATHAN. An American jurist and Justice of the Supreme Court of the United States, died at Port Chester, N. Y., July 9, 1938. Born in New York City, May 24, 1870, he was educated at Columbia University (A.B., 1889; A.M., 1890) and, instead of attending law school, read himself into the law. Admitted to the bar in 1891, he did not enter general practice, but specialized in the preparation of cases for appeal.

In 1913 a Fusion movement in New York politics brought him the nomination for justice of the Supreme Court of the State of New York. The judiciary committee of the Bar Association said that he was one "who has furnished unmistakable evidence of fitness and qualification for the highest order of judicial service." He was elected to serve until 1928, but on Feb. 2, 1914, shortly after he had taken office, he was appointed by Governor Glynn to serve as a temporary judge of the Court of Appeals. This appointment was made permanent by Governor Whitman on Jan. 14, 1917, and in the elections of that year he was elected to a full term, with the endorsement of both the Democratic and Republican parties. In 1927 he was elected chief justice of that Court.

While serving in the New York Courts, Cardozo was appointed by the American Law Institute to a committee to restate and simplify the law (1923) and in 1925 he was named chairman of a committee on plan and scope appointed to aid a commission authorized by the State Legislature to investigate defects in the law. His recommendation of a permanent agency to function between the courts and Legislature saw fruition in the creation of the Judicial Council of New York in 1934. In 1927 President Coolidge offered him one of the American memberships in the International Permanent Court of Arbitration at The Hague, but he declined it.

On Feb. 15, 1932, President Hoover appointed Judge Cardozo an associate justice of the Supreme Court of the United States to succeed Oliver Wendell Holmes who had retired, and he took his seat there on March 14. He joined with Justices Brandeis and Stone in forming the so-called "liberal

minority" of the court, which later was joined on occasion by Chief Justice Hughes and Justice Roberts to form the majority. He became one of the most consistent supporters of New Deal legislation and in the early days of the Administration was often associated with dissenting opinions, but upon the complexion of the Court being changed, he found himself in the majority. He concurred in the unanimous opinion that the National Industrial Recovery Act was unconstitutional in May, 1935, and in a separate opinion was vigorous in his condemnation of the usurpation of Congressional power by the executive. By 1937, legislation, which had been advocated by the minority only a year or two before, was upheld by the Court, and Cardozo, Brandeis, and Stone were definitely responsible for the broadening of the interpretations of the Court, Cardozo being attributed with the broadening of the welfare clauses. At the close of the Court term in May, 1937, he had opposed the Administration's measures but five times, and supported them 22 times, included in which were the Wagner Act and the Social Security Act, for which latter he was entrusted with the writing of the majority opinion, which was believed would take a historical place among the major decisions of the Court. He served diligently until he became ill on Dec. 13, 1937, which led to his decision to retire at the convening of Court in October, 1938.

His vast knowledge of the law, his sincerity, and his broad human understanding made him one of the great liberal judges of all time, and in his clarity of thought and lucidity of expression he was frequently compared to his predecessor. His contribution to constitutional interpretation in the U.S. Supreme Court was great, but his contribution to the common law while Chief Justice of the N. Y. Court of Appeals was considered by legal authorities as being of greater and more lasting value. It was Cardozo's belief that the law should have a threefold purpose; to be (1) evolutionary and historical; (2) pragmatic and realistic; and (3) sociological and humanitarian.

He was an active vice-president of the American Law Institute from its founding; a trustee of Columbia University; and a leading figure in Jewish movements, being a trustee of the Hebrew University in Palestine and a member of the American Jewish Committee, from which activities he retired when appointed to the Supreme Court. In 1931 the Roosevelt Memorial Association awarded him the Roosevelt Medal for "distinguished services," and Harvard University conferred upon him the Ames Medal for distinguished contributions to jurisprudence.

Justice Cardozo was the author of *Jurisdiction of New York Court of Appeals* (1909), which became a handbook for practising lawyers; *The Nature of the Judicial Process* (1921) and *The Growth of the Law* (1924), lectures delivered before the Yale Law School; *The Paradoxes of Legal Science* (1928), the Carpenter lectures delivered at Columbia University, 1927-28; and *Law and Literature and Other Essays* (1931), which included the essay, "What Medicine Can Do for Law," delivered before the New York Academy of Medicine.

CARINTHIA. See AUSTRIA.

CARLETON COLLEGE. A coeducational college of liberal arts in Northfield, Minn., founded in 1866. The enrollment for the autumn of 1938 was 879. There were 83 faculty members. The endowment amounted to \$3,518,443, and the total income for the year was \$580,699. The library contained

121,649 volumes and 31,953 pamphlets. President, Donald John Cowling, Ph.D., D.D.

CARNEGIE CORPORATION OF NEW YORK. Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States, Canada, and the British colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable elsewhere than in the United States. The annual report of the president, Frederick P. Keppel, showed that during the fiscal year 1937-38 the sum of \$3,830,135 was appropriated.

The trustees of the corporation as of Dec. 1, 1938, were: Thomas S. Arbutnot, Nicholas Murray Butler, Samuel Harden Church, Henry James, Walter A. Jessup, Nicholas Kelley, Frederick P. Keppel, Russell Leffingwell, John C. Merriam, Margaret Carnegie Miller, Frederick Osborn, Arthur W. Page, and Elihu Root, Jr. Officers of administration were: Frederick P. Keppel, president; Robert M. Lester, secretary; and Robertson D. Ward, treasurer. Office: 522 Fifth Avenue, New York City.

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. THE. A foundation established in 1905 by Andrew Carnegie, who placed an endowment of \$10,000,000 in trust for the purpose of encouraging higher education in the United States, Canada, and Newfoundland. Following its incorporation by Congress in 1906, its resources were increased by a further gift of \$5,000,000 from Mr. Carnegie in 1908 and by appropriations of \$1,250,000 in 1913 and \$12,000,000 in 1918 from the Carnegie Corporation of New York. On June 30, 1938, its endowments and accumulated reserves amounted to \$27,947,419.

The foundation publishes extensive annual reports, which deal with many phases of the educational process. In 1938 it was engaged upon various studies concerning higher education in the United States, professional education, the relations between secondary and higher education in Pennsylvania, and graduate instruction. Dr. Walter A. Jessup is president, Dr. Henry Smith Pritchett, president emeritus, and Howard J. Savage, secretary and treasurer. Headquarters are at 522 Fifth Avenue, New York City.

CARNEGIE INSTITUTE OF TECHNOLOGY. A nonsectarian institution for technical education at Schenley Park, Pittsburgh, Pa., founded in 1900. The enrollment for the autumn of 1938 was 5445, including 2331 registered in the regular day courses and 3114 in the evening courses. For the summer session 660 students were enrolled. The faculty numbered 390. The endowment amounted to \$17,349,538, and the annual income was \$1,834,816 (not including student fees). The institute is adjacent to the Carnegie Library of Pittsburgh, which has 450,600 volumes. President, Robert Ernest Doherty, B.S., M.S., M.A., LL.D.

CARNEGIE INSTITUTION OF WASHINGTON. An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." The Institution attempts to advance fundamental research in fields not normally covered by the activities of other agencies, and to concentrate its attention upon specific problems, with the idea of shifting attack from time to time to meet the more pressing needs of research as they develop with increase of knowledge.

Income on investments for the year 1938 amount-

ed approximately to \$1,500,000, and was required almost entirely for support and maintenance of major projects undertaken by the Institution. Results of its work were made known through technical and scientific journals, its yearbook, and a series of scientific monographs and news releases. To date the Institution has issued over 700 monographic publications.

W. Cameron Forbes is Chairman of the Board of Trustees of the Institution, and Vannevar Bush becomes President on Jan. 1, 1939. Other Trustees are: Thomas Barbour, James F. Bell, Robert Woods Bliss, Frederic A. Delano, Homer L. Ferguson, Walter S. Gifford, Herbert C. Hoover, Walter A. Jessup, Frank B. Jewett, Charles A. Lindbergh, Alfred L. Loomis, Roswell Miller, Henry S. Morgan, Stewart Paton, John J. Pershing, Elihu Root, Jr., Henry R. Shepley, William Benson Storey, Richard P. Strong, Charles P. Taft, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed. Headquarters: Sixteenth and P Streets, N.W., Washington, D. C.

CASUALTY INSURANCE. See INSURANCE.

CATALONIA. A region in northeastern Spain, consisting of the provinces of Barcelona, Gerona, Lérida, and Tarragona. Chief city, Barcelona. See SPAIN under *History*.

CATHOLIC ASSOCIATION FOR PEACE. See PEACE.

CATHOLIC UNIVERSITY OF AMERICA, THE. A national pontifical institution of higher education, located in Washington, D. C., and founded in 1863 by the Roman Catholic hierarchy of the United States with the approval of the Holy See. The enrollment for the autumn of 1938 was 1987, of which 530 were in the Graduate School, 43 in Canon Law, 108 in Law, 337 in Arts and Sciences, 249 in Engineering and Architecture, 133 in the School of Philosophy, 62 in Social Work, 153 in the School of Nursing, 170 in the School of Sacred Theology, and 88 in the School of Social Science, and 52 in the National Catholic School of Social Service. The summer school enrollment for 1937 was 1815. The faculties number 275 teachers, with 51 additions in 1938. In the library there are 350,000 volumes. Chancellor, the Most Reverend Michael J. Curley, S.T.D., Archbishop of Baltimore; Rector, Rt. Rev. Monsignor Joseph M. Corrigan, S.T.D.

CATTLE. See DAIRYING.

CAYMEN ISLANDS. See JAMAICA.

CELEBES. See NETHERLANDS INDIES.

CELEBRATIONS. Numerous celebrations, expositions, exhibitions, and trade fairs were held throughout the world during the year. The more important included the 150th anniversary of the founding of Australia, celebrated from January through April in Sydney, the premier city, and New

South Wales, the mother state; the British Industries Fair, opened February 21; and the Empire Exhibition at Glasgow opened by King George and Queen Elizabeth on May 3. The principal building of the last-named was the Palace of Engineering, which contained exhibits provided by shipbuilding and other heavy industries. To the Palace of Art, Marshall Field loaned his Raeburn portrait of Captain David Burrell and Edward S. Harkness his Raeburn portrait of the Drummond children. The estimated cost of the Exposition was £10,000,000 and it closed October 29. See ARCHITECTURE.

The tercentennial of the settlement of the first Swedish colonists was celebrated in Delaware, (q.v.) June 27-30. See LUTHERAN CHURCH.

Work on the San Francisco (Golden Gate International) Exposition and the World's Fair, New York, both to open in 1939, progressed rapidly. Plans were announced for a Swiss National Exposition, Zurich, in May, 1939, a World's Fair in Tokyo, Japan, in 1940, and a World's Fair in Rome, Italy, in 1942.

Other fairs and expositions were the Leipzig Trade Fair spring, opened March 6; the Crafts & Industries Exhibition, Oslo, opened May 12 and continued throughout the summer; 37th annual Prague Trade Fair, September 2-11; the Canadian National Exposition, August 26-September 10; 26th annual East Prussian Fair, opened August 21; the Vienna Autumn Trade Fair, opened September 11; Turkey's 8th International Fair at Smyrna (Izmir), August 20-September 20; the Texas State Fair, October 8-23; and a national fair at Guatemala City, Guatemala, November 20-27.

Although reported to be reopening for the year 1938, the Paris Exposition of 1937 remained closed.

CELTIC. See PHILOLOGY, MODERN.

CEMENT. Total cement production in the United States, according to the U.S. Bureau of Mines, for 1938, amounted to 105,548,000 bbl., compared with 116,478,000 in 1937. Shipments were 106,524,000 bbl. compared to 114,010,000 in 1937. Production and shipments for 1938 decreased 9.1 per cent and 6.4 per cent from 1937 figures. Exports for 1938 amounted to 431,749 lb. valued at \$802,648; imports were 644,909,156 lb. valued at \$1,398,173.

In the following table of the relation of production to capacity, the total output of finished cement is compared with the estimated capacity of 160 plants at the close of December, 1937, and 161 plants at the close of December, 1938.

RATIO (%) OF PRODUCTION TO CAPACITY

	December	
	1937	1938
The month	32.2	36.9
12 months ended	45.3	41.0

The Portland Cement Association reported that in 11 months of 1938, awards were made of 50,946,-539 sq. yd. of concrete pavement for roads, streets, and alleys.

CENTRAL AMERICA. See BRITISH HONDURAS, COSTA RICA, GUATEMALA, HONDURAS, NICARAGUA, PANAMA, SALVADOR, EL.

CENTRAL AUSTRALIA. Formerly a separate territory of Australia; now included in the Northern Territory of Australia (q.v.).

CEYLON, sê-lôn'. A British crown colony near the southern extremity of India. Area, 25,332 square miles; population (Jan. 1, 1937, estimate), 5,678,000 compared with 5,312,548 (1931 census). The chief cities (with 1936 estimated populations)

are: Colombo, the capital, 310,400; Jaffna, 47,700; Moratuwa, 34,900; Galle, 38,000; Kandy, 40,100. In 1936, 192,060 births, 123,039 deaths, and 26,779 marriages (exclusive of Moslem marriages) were registered. The primary and secondary schools had 717,287 pupils in attendance; the Ceylon University College had 541 students enrolled (1936-37).

Production and Trade. The staple products of the island are agricultural, the areas, in acres, of the various crops in 1937 being rice (850,000), other grain (105,000), tea (559,000), coconuts (1,100,000), rubber (605,000), cinnamon (26,000), cacao (34,000), citronella (33,000), and tobacco (14,000). Livestock in Ceylon in 1937 included 1,604,000 horned cattle, 61,000 sheep, 220,000 goats, 37,000 pigs, and 1300 horses. Work in gold, silver, brass, ivory, and tortoiseshell are important industries in addition to weaving, pottery, metal and lacquer work, and basket and mat making. Factories for the manufacture of cigarettes, matches, and soap have been established. The manufacture of salt is a government monopoly. There were 81 plumbago mines working at the end of 1936. Pearl fishing was carried on periodically in the north-west of the island. Hundreds of small quarries exist in which are found sapphires, rubies, moonstones, and cat's-eyes. In 1937 imports were valued at Rs243,135,826; exports, Rs332,116,923 (rupee averaged \$0.3733 for 1937). Great Britain was Ceylon's best customer, supplying Rs54,086,866 of the imports and taking Rs143,364,379 of the exports.

Communications. In 1937 there were 951 miles of railway open to traffic (834 miles of 5-ft. 6-in. gauge, the remainder of 2-ft. 6-in. gauge). Shipping entered and cleared the ports during 1936 totaled 2883 vessels, excluding warships, transports, coast sailing vessels, and those only coaling or oiling. The construction of two piers, with modern up-to-date facilities, in the harbor of Colombo at an estimated cost of £1,000,000, was approved during the latter part of 1938. On Feb. 28, 1938, the new air service connecting Colombo with the Empire air route from Southampton to Karachi was inaugurated by the opening of the air-drome at Ratmalana, Colombo.

Finance. The revised estimate of revenue for the fiscal year 1937-38 was Rs113,474,350, and the estimated expenditure, including the loss on the railways, was Rs114,474,350. For the fiscal year 1938-39 revenue was estimated at Rs117,426,650 and expenditure at Rs128,952,900, which includes Rs5,471,160 of loan-fund expenditure. On Sept. 30, 1937, the net total public debt of Ceylon amounted to Rs134,625,200.

Government. The government is administered by a governor, assisted by a state council of 61 members (50 elected on a territorial basis, 8 nominated unofficial, and 3 officers of state). This state council is divided into 7 executive committees in charge of various subjects, and the chairmen of these committees are ministers for the subject concerned. A government agent is at the head of each one of the 9 provinces into which the island is divided for administrative purposes. Governor, Sir Andrew Caldecott (assumed office, Oct. 16, 1937).

History. Sir Andrew Caldecott, the governor, in correspondence (published on Dec. 21, 1938) with Malcolm MacDonald, the British colonial secretary, advocated the abolition of the existing executive committee system in favor of something approaching a cabinet system of government. The colonial secretary authorized the state council to debate the governor's proposals and said that "on

the result of that debate and the expressions of public opinion which may result will depend my consideration of what measures, if any, should be taken for the amendment of the constitution."

Maldivé Archipelago. A chain of some 2000 coral islets (about 200 inhabited), 400 miles southwest of Ceylon, of which they are a dependency. Area (land), 115 square miles; population (1931), over 79,000 Moslems. Capital, Malé. The main products are coconuts, millet, dried fish, cowrie and tortoise shell, and edible nuts. The modified constitution provides for an elected Sultan, a people's assembly of 33 members (28 elected and 5 nominated), and a cabinet of 4 ministers. Sultan, Hasan Nuruiddin Iskander II (elected, Mar. 12, 1935; assumed Sword of State, July 21, 1938).

CHACO DISPUTE, SETTLEMENT OF. The 86-year-old boundary dispute between Bolivia and Paraguay that resulted in the sanguinary Chaco War of 1932-35 was settled by a Treaty of Peace, Friendship, and Boundaries signed at the Chaco Peace Conference in Buenos Aires on July 21, 1938.

The treaty was ratified on August 10 by the Constitutional Assembly of Bolivia and by a plebiscite in Paraguay. It went into effect with the formal exchange of ratifications at Buenos Aires on August 29. The text of the principal articles of the treaty follows:

I. Peace between the Republics of Paraguay and Bolivia (Bolivia and Paraguay) is re-established.

II. The dividing line in the Chaco between Bolivia and Paraguay (Paraguay and Bolivia) will be that determined by the Presidents of the Republics of Argentina, Chile, United States of America, United States of Brazil, Peru, and Uruguay in their capacity as arbitrators in equity, who acting *ex aequo et bono* will give their arbitral award in accordance with this and the following clauses:

A. The arbitral award will fix the northern dividing line in the Chaco in the zone comprised between the line of the Peace Conference presented May 27, 1938, and the line of the Paraguayan counter-proposal presented to the consideration of the Peace Conference June 24, 1938, from the meridian of Fort 27 of November, i.e. approximately meridian 61 degrees 55 minutes west of Greenwich, to the eastern limit of the zone, excluding the littoral on the Paraguay River south of the mouth of the River Otquis or Negro.

B. The arbitral award will likewise fix the western dividing line in the Chaco between the Pilcomayo River and the intersection of the meridian of Fort 27 of November, i.e. approximately 61 degrees 55 minutes west of Greenwich, with the line of the award in the north referred to in the previous paragraph.

C. The said line will not go on the Pilcomayo River more to the east than Pozo Hondo, nor to the west further than any point on the line which, starting from D'Orbigny, was fixed by the Neutral Military Commission as intermediary between the maximum positions reached by the belligerent armies at the suspension of fire on June 14, 1935.

III. The arbitrators will pronounce, having heard the parties and according to their loyal knowledge and understanding, taking into consideration the experience accumulated by the Peace Conference and the advice of the military advisers to that organization.

The six Presidents of the republics mentioned in Article II have the faculty of giving the award directly or by means of plenipotentiary delegates.

IV. The arbitral award will be given by the arbitrators within a maximum of two months counting from the ratification of the present treaty, obtained in the way and form stipulated in Article XI.

V. The award being given and the parties notified, these will immediately name a mixed commission composed of five members, two named by each party, and the fifth designated by common agreement of the six mediatory governments in order to apply on the ground and set the bournes of the dividing line given by the arbitral award.

VI. Within 30 days after the award, the Governments of Bolivia and Paraguay (Paraguay and Bolivia) will proceed to accredit their respective diplomatic representatives in Asunción and La Paz (La Paz and Asunción) and within 90 days will fulfill the award in its principal aspects, under the vigilance of the Peace Conference, to whom the parties recognize the faculty of resolving definitely the practical questions which may arise in this connection.

VII. The Republic of Paraguay guarantees the amplest free transit through its territory and especially

through the zone of Puerto Casado, of merchandise arriving from abroad destined to Bolivia and of the products which issue from Bolivia to be embarked for abroad through the said zone of Puerto Casado; with the right for Bolivia to install customs agencies and construct depots and stores in the zone of the said port.

The regulations of this article will be the object of a later commercial convention between both republics.

VIII. The arbitral award having been executed through the application and setting of bournes of the dividing line, the Governments of Bolivia and Paraguay (Paraguay and Bolivia) will negotiate directly, government to government, the other economic and commercial conventions they deem proper to develop their reciprocal interests.

IX. The Republics of Bolivia and Paraguay (Paraguay and Bolivia) reciprocally renounce all action and claim deriving from the responsibilities of the war.

X. The Republics of Bolivia and Paraguay (Paraguay and Bolivia), renewing the non-aggression pact stipulated in the Protocol of June 12, 1935, solemnly obligate themselves not to make war on each other nor to use force, directly or indirectly, as a means of solution of any present or future difference.

If in any event these were not resolved by direct diplomatic negotiations, they obligate themselves to have recourse to the conciliatory and arbitral procedures offered by international law, and especially the American conventions and pacts.

The Arbitral Award. In accordance with Article III the Presidents of the mediating powers delegated their functions as arbitrators to their chief plenipotentiaries at the Chaco Peace Conference. The latter immediately convened as an arbitral board. Both parties presented their claims before the arbitrators in the form of oral arguments and briefs supported by extensive documentation. Meanwhile the advisory military commission to the Peace Conference was making an aerial photographic survey and inspection of the zone of arbitration. Following presentation of the commission's report the arbitrators traced a frontier line within the limits fixed by the peace treaty, taking into account also "the antecedents accumulated by the Peace Conference as well as the needs of the parties with regard to their mutual security and geographic and economic necessities." The text of their unanimous award, issued on Oct. 10, 1938, follows:

The dividing line in the Chaco between the republics of Bolivia and Paraguay is the following:

In the northern zone will go from the intersection of meridian 61 degrees 56 minutes 57 seconds west of Greenwich and parallel 20 degrees zero five minutes 01 seconds latitude south (27 of November or Gabino Mendoza) to continue in a straight line to the highest point of Cerro Capitan Ustares (Usquares); thence in a line to intersection of the Ravelo-Ingavi road with the southern limit of the Canada del Palmar de las Islas; from this point also in a straight line to the intersection of the meridian of Fort Paredes with the parallel of Fort Ravelo; thence in a straight line to the highest point of Cerro Chovoreca; thence it will descend in a line to Cerrito Jara; thence also in a straight line to the intersection of parallel 19 degrees 49 minutes 40 seconds latitude south with the Rio Negro or Otquis and following the *thalweg* of the said river will end at the mouth of the same in the Paraguay River at 20 degrees 09 minutes 58 seconds latitude south and 58 degrees 10 minutes 12.9 seconds west of Greenwich.

In the western zone the line will go from the intersection of meridian 61 degrees 56 minutes 57 seconds west of Greenwich and parallel 20 degrees zero five minutes 01 seconds latitude south (27 of November or Gabino Mendoza) and will descend in a straight line in a south south westerly direction to the place called Villazon, 15 kilo meters southwest of Irindague (Yrendague); thence in a straight line southward to intercept the road from Estrella to Capirenda (Capt. Carreras Saguier) at a point 11 kilometers west of Estrella; thence in a straight line to end in the *thalweg* of the Pilcomayo River at 62 degrees 31 minutes 19 seconds longitude west of Greenwich.

Course of Negotiations. The Chaco Peace Conference, at which the two parties to the dispute and Argentina, Brazil, Chile, Peru, Uruguay, and the United States were represented, had been in almost continuous session since July 1, 1935 (see 1935, 1936, and 1937 YEAR BOOKS for its negotiations). The beginning of 1938 found the Confer

ence still in the impasse caused by the refusal of the Paraguayan army to relax its grip on the vital highway from Santa Cruz to Yacuiba, Argentina, constituting eastern Bolivia's principal commercial outlet. With the expiration of President Justo's term as chief executive of Argentina on Feb. 20, 1938, the Chaco Conference named him its honorary president in the hope that his prestige would help to end the deadlock in the peace negotiations. In April the Conference sent delegations to La Paz and Asunción in an effort to persuade the two governments to accept a new peace formula. Both governments rejected the proposals in the middle of April and General Justo ended his connection with the proceedings.

Meanwhile Dr. José María Cantilo had succeeded Dr. Carlos Saavedra Lamas as Foreign Minister of Argentina. After discussing the Chaco situation with representatives of the other mediating governments at Rio de Janeiro and Santiago, Dr. Cantilo assumed the Presidency of the Chaco Peace Conference on April 22 and launched a vigorous new effort to reach a settlement. The Conference delegations sent to La Paz and Asunción had sounded out the two governments as to the maximum concessions and minimum demands they were prepared to make. Paraguay demanded practically all of the territory occupied by her troops during the Chaco War, which would exclude Bolivia from the Paraguay River. Bolivia suggested a boundary drawn from Fort Linares on the Pilcomayo northward to Fort Ingavi in the central Chaco and from there southwestward to Puerto Leda on the Paraguay.

Renewing negotiations on the basis of these proposals, the Conference on May 16 invited the Bolivian and Paraguayan Foreign Ministers to come to Buenos Aires. They accepted, and on May 27 the Conference submitted to them a new peace formula. This proposed that the boundary be drawn from Puerto Esmeralda on the Pilcomayo River northward to Fort 27 of November, then northeastward to Cerro Cristian on the 60th meridian between Forts Ravelo and Ingavi, and eastward to the Paraguay River at a point north of the 20th parallel, giving Bolivia a long-sought river outlet at Puerto Caballo.

Bolivia accepted the formula but Paraguay balked at giving Bolivia a port on the Paraguay River. On June 24 Paraguay submitted a counter-proposal by which the frontier line would begin at Cururenda on the Pilcomayo, run just west of the Bolivian villages of Capirenda and Carandaiti, then north to Los Maticos on the Parapeti River, and eastward through Ravelo to Fort San Juan near the Brazilian frontier. Bolivia then threatened to withdraw from the Peace Conference rather than accept total exclusion from the Paraguay River. Meanwhile Paraguay on June 21 had notified the League of Nations of its withdrawal from the Permanent Court of International Justice at The Hague. This step was designed to prevent the Chaco dispute from being placed before the World Court by the Chaco Peace Conference, as was required under the Pact of Truce of June 12, 1935, in case mediation failed.

These events aroused fears of a renewal of the Chaco conflict. Both Bolivia and Paraguay had increased their armies beyond the limit of 5000 men fixed in the Pact of Truce. Minor clashes occurred between Bolivian and Paraguayan patrols. Large troop movements were reported on both sides of the temporary frontier fixed by the neutral military commission after the cessation of fighting in 1935.

Foreign purchases of munitions were made by both countries.

At this critical junction, Gen. José Félix Estigarribia, commander-in-chief of Paraguay's victorious armies in the Chaco War and newly appointed Minister to Washington, left his post and hastened to Buenos Aires by airplane. He arrived early in July just after Bolivia rejected a Conference proposal that the frontier be fixed by arbitration within the zone delimited by Paraguay's counter-proposal and the Conference's formula of May 27. With the Conference in a mood to end its mediation, General Estigarribia threw his powerful influence on the side of a compromise settlement. Against the opposition of Geronimo Zubizarreta, head of the Paraguayan delegation to the Peace Conference, Estigarribia induced his government to abandon its intransigent stand. Zubizarreta resigned in protest against this policy. The negotiations thereafter made rapid headway.

On July 9 a draft peace treaty was initiated by the Bolivian and Paraguayan Foreign Ministers at Buenos Aires. Both governments notified the Peace Conference on July 17 that they approved the draft and after the Conference had ironed out minor reservations by Paraguay the formal signing of the treaty followed on July 21. This compromise settlement assured Paraguay's possession of the greater part of the Chaco Boreal, but gave Bolivia undisputed ownership of the oil zone west of the Chaco proper and of the Santa Cruz-Yacuiba highway. A narrow zone of territory some 30 to 80 miles wide was submitted to arbitration. Bolivia's demand for a deep-water port on the Paraguay was met in part by making Puerto Casado in the Paraguayan Chaco a free port for Bolivian commerce.

Moreover, the arbitral award confirmed Bolivia's claim to the narrow strip of river bank between the mouth of the Rio Negro and the Brazilian boundary, including Puerto Caballo. The latter port was of limited usefulness, however, being inaccessible during the dry season to vessels having a draught of more than 6 feet. In general, the arbitral board rejected Paraguay's boundary claims with reference to the western and northeastern sections of the arbitral zone while granting her claims in the northwest. The western frontier followed closely the line proposed by the Peace Conference on May 27. The northern boundary followed substantially the line occupied by Paraguayan troops at the close of the Chaco fighting with the exception of the transfer of the enclave north of the Rio Negro to Bolivia. Paraguay's title was confirmed to 91,120 square miles of territory in the Chaco Boreal, or about three times as much as she actually held at the beginning of the Chaco War in 1932. The zone submitted to arbitration comprised 16,023 square miles, of which Bolivia received 14,671 square miles.

A mixed commission, consisting of two Bolivians, two Paraguayans, and an Argentine named by the mediating powers, was constituted on October 28 to survey and mark the boundary line, a task expected to take two years. In further fulfillment of the peace treaty, the Bolivian and Paraguayan Governments on November 26 resumed diplomatic relations. Dr. Fabián Vaca Chávez, former Bolivian Foreign Minister, was named Minister to Asunción, and Dr. Justo Pastor Benítez, Paraguayan Foreign Minister during the first part of the Chaco War, was sent to La Paz. They undertook negotiations for the treaty of commerce and navigation envisaged in the peace treaty.

See BOLIVIA and PARAGUAY under *History*.

CHAD. See FRENCH EQUATORIAL AFRICA.

CHADBOURNE, THOMAS L. (INCOLN). An American lawyer, died in New York, June 15, 1938. Born in Houghton, Mich., in 1871 he studied at the University of Michigan, and in 1892 was admitted to the bar and began the practice of law in Milwaukee, Wis., but in 1895 removed to Chicago, subsequently coming to New York where he entered the field of corporation law.

A Democrat in politics, Mr. Chadbourne first came into prominence in 1913 when he raised a \$2,000,000 campaign fund to elect John Purroy Mitchell mayor of New York. Also, he was active in the presidential campaigns of Woodrow Wilson and John W. Davis. During the World War he served as a dollar-a-year man on the War Trade Board, and in 1919 President Wilson appointed him a representative of the public at the National Industrial Conference. In 1922 he directed negotiations for the merger of the Midvale Steel & Ordnance Co., the Republic Iron & Steel Co., and the Inland Steel Co., into the \$251,000,000 North American Steel Co., which failed because of the complaint of the Federal Trade Commission that it was unfair to competition.

Mr. Chadbourne was probably best known as the author of the so-called Chadbourne Plan for the world control of sugar, which had for its purpose a reduction of production to bring prices to the producer to a more profitable basis. This plan was adopted by Czecho-Slovakia, Germany, Poland, Belgium, The Netherlands, Cuba, Java, and Peru at the International Sugar Conference held at Brussels in 1931. It was to have been in effect until Sept. 1, 1935, but shortly before that date delegates from the countries adhering to the agreement voted to abandon it at its expiration.

Considered a "radical capitalist," he had served as president of the American Association for Labor Legislation (1919-26), and was an early champion of such protective labor measures as old-age pensions and workmen's compensation laws.

CHALIAPINE, shal-ya'pên, FEODOR IVANOVICH. A Russian singer, died in Paris, Apr. 12, 1938. Born in Kazan, Russia, Feb. 1, 1873, he attended the local schools and after apprenticeship in several trades, was a clerk in various government bureaus. His first musical knowledge was received as a boy in the choir of the Archbishop of Kazan, and when older he sang whenever possible with traveling light-opera companies. About 1890 he joined a Little-Russian traveling company and when the troupe was stranded earned his living by singing in the streets and in cafés. It was in Tiflis (1892) that the singer Usatov heard him and offered to tutor him.

Chaliapine's first operatic engagement was with the Tiflis State Theater where he made his debut in Glinka's *A Life for the Tsar*. In 1894 he left Tiflis for Moscow where he was engaged by the impresario Lentovsky to sing the role of Dr. Miracle in *Tales of Hoffman* and afterward to appear at the Arcadia in St. Petersburg. In the following year he sang at the Panaevsky and Mariensky Theaters, St. Petersburg, his roles being Mephistopheles in *Faust*, Russlan in *Russlan and Ludmilla* and the miller in *Russalka*.

In 1896 Chaliapine joined the private opera company of S. I. Mamontov, where he obtained his first real opportunity. He sang the part of Prince Vladimir in *Rognieda*, Susanin in *A Life for the Tsar*, Mephistopheles in *Faust*, and originated the role of Ivan the Terrible in the première of Rimski-

Korsakov's *Maid of Pskov* (*Pskovitianka*). In the following year he studied the part of Holofernes in *Judith*. In 1898 he made his greatest success in the title role of Rimski-Korsakov's revision of Mussorgsky's *Boris Godunov*. Subsequently he appeared in *Khovanstchina*, *A May Night*, *The Tsar's Bride*, and Rimski-Korsakov's *Sadko*, and the more he played these roles the more he realized that an operatic artist must not only sing but must act too. Thereafter he appeared in Rimski-Korsakov's *Mozart and Salieri*, playing the latter role.

He returned to the Imperial Theaters in 1899, signing a three-year contract, and thereafter was seen in the parts that made him famous. He went to Paris in 1900 and sang at private soirees and in 1901 was invited to join the Milan Opera Co., to sing the title role in Boito's *Mephistopheles* for the season. Returning to Russia he divided his time between the Mariensky Theater in St. Petersburg and the Balshie in Moscow. Subsequently he sang at Monte Carlo.

During 1907-08, Chaliapine appeared with the Metropolitan Opera Co., New York, making his debut in Boito's *Mephistopheles* on Nov. 20, 1907. Also, he sang in *Faust*, *The Barber of Seville*, and *Don Giovanni*. His unorthodox interpretation did not arouse unusual enthusiasm, probably because he had no opportunity of singing his famous Russian roles. Subsequently he sang in Paris, Milan, Monte Carlo, and South America.

His English debut was made in London during the Beecham Russian Opera Season (1913-14). With the outbreak of the War in Europe he returned to Russia where he was the head of the Mariensky Theater until 1921. His first appearance outside of Russia was at a concert in Albert Hall, London, in that year. Then he was invited to join the Metropolitan Opera Co., New York, to take Caruso's place as leading singer in the company. This time he was successful and received great acclaim for his interpretation and singing, especially the roles of Boris in *Boris Godunov* and as Mephistopheles in *Faust*. Lawrence Gilman said of his Boris, "There is little to say about it except that it is in probability the greatest performance the lyric stage has ever known." And Olin Downes wrote, "An imperishable creation that will long remain as the supreme model for interpreters of this part."

During 1922-23, Chaliapine toured England and the Continent and then returned to the United States, where he sang for many years with the New York and Chicago opera companies. In 1922 he returned to Russia where he enjoyed wide popularity, but in 1927 he quarreled with the Soviet Government and was deprived of his title, "Artist of the People," and his estates, which had been given to him by the Government, were confiscated. At that time he left his native country never to return, becoming a French citizen and making his permanent home in Paris. On Mar. 20, 1929, the singer made his farewell appearance with the Metropolitan Opera Company in New York as Mephistopheles in *Faust*, but frequently returned to America in concert, where he popularized "The Song of the Volga Boatmen" and "The Song of the Flea." His last appearance on this stage was on Mar. 3, 1935. In the following year he made a concert tour of the Far East and a scheduled appearance in November, 1937, was canceled because of his ill health.

The greatest singing actor of the past four decades, Chaliapine was that rarity of grand opera, a singer who could act, an actor who could sing. A basso cantato, his voice was capable of innumerable shades of color and meaning. Other of his fa-

mous roles were Philip II in *Don Carlo*; Don Quixote in Massenet's *Don Quixote*, which was written for him in 1910; Eremka in Serov's *Power of Evil*; Dositeus in *Kovantschina*.

In 1934 the singer played the title role in a French motion picture production of *Don Quixote*, achieving quite a success. He was the author of *Fedor Ivanovitch's Autobiography: Pages from My Life* (1927) and *Man and Mask* (1932).

CHAMBER MUSIC. See **MUSIC**.

CHAMBER OF COMMERCE OF THE UNITED STATES. A national federation of trade associations and local or regional commercial organizations, established in 1912 primarily as a vehicle for the expression of national business opinions on important economic questions. The membership in 1937 consisted of more than 1600 chambers of commerce and trade associations covering the entire United States.

The Chamber maintains 12 service departments, covering main divisions of business activity: Agriculture; Construction; Commercial Organization; Manufacture; Domestic Distribution; Finance; Foreign Commerce, Insurance; Natural Resources Production; Trade Association; Transportation and Communication; Research. It publishes a monthly magazine, the *Nation's Business*, and a semi-monthly publication, *The Washington Review*, which deals with the relations between government and business.

One of the major activities of the Chamber in 1938 was to give force and direction to the countrywide campaigns of local business organizations to bring about a better public understanding of the services and functions of business. The campaign's slogan, "What Helps Business Helps You," has become a national by-word.

In addition to the campaign, the Chamber continued to center its attention upon problems involved in the governmental regulation of trade and industry. Its spokesmen appeared before a number of Congressional Committees to present a practical viewpoint on pending legislation. Attention was given to the increasing burden of taxes—Federal, state, and local—and constructive recommendations were made for cutting down the costs of government.

During the year the Chamber sponsored two important conferences—one to stimulate private construction and the other to develop a rational program to rehabilitate the railroads. The findings of both conferences, coming from practical-minded business, aroused widespread public interest and support.

George H. Davis of Kansas City, serving a second term, is president of the Chamber. The Chairman of its Executive Committee and active resident officer is John W. O'Leary of Chicago. Vice-Presidents are: W. Gibson Carey, Jr., New York City; Fred H. Clausen, Horicon, Wis.; Joseph W. Evans, Houston, Tex.; Clem D. Johnston, Roanoke, Va.; James S. Kemper, Chicago; W. C. Mullendore, Los Angeles.

CHAUTAUQUA INSTITUTION. An educational movement established on Chautauqua Lake, Chautauqua, N. Y., in 1874 by Lewis Miller and Bishop John H. Vincent, both prominent in the Methodist Episcopal Church. Originally for Sunday school teachers, it developed into an institution

affording during July and August each year a correlated lecture series, summer school conducted by New York University, operas, and plays. Its summer music festival features a symphony orchestra, concerts, and recitals. Annual attendance is 50,000, the schools enrolling 1600. Present officers are: George E. Vincent, honorary president; Arthur E. Bestor, president; Charles E. Pierce, secretary; and Gerald M. Lynch, treasurer.

CHECHEN-INGUSH AUTONOMOUS SOVIET SOCIALIST REPUBLIC. See **RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC**.

CHEESE. See **DAIRYING**.

CHEMISTRY. New nuclear particles; successful culmination of a half-decade of intensive research in concentrating isotopes for biological research; methylene radicals; assimilation of ammonium compounds by cattle; enzyme patterns on oil drops; continued attack on the energy levels within the nucleus; new lines of low temperature work; electron-beam measurements; effect of European politics on pure research; all these appeared in the spotlight of the 1938 chemical arena.

Archaeology. The Soviet Union is performing good work in preserving and restoring documents of antiquity. Explorer Kozlov brought 2000 Chinese scrolls from Mongolia which were opened by static electricity. Birchbark inscriptions from the Volga German republic were fixed in plastic and read by infra-red light. In place of microfilm for records they use thin sheets of platinum bound in books with glass covers.

Evidences that Mexico used a cloth composed of yucca strands crossed by cotton threads 2000 years ago contradicts the belief that cotton came from Central and South America.

Astronomy. A new blow was dealt to the theory of life on Mars when P. Millman showed that the spectrum of the canals on Mars did not contain chlorophyll green lines. A. Shenstone discovered a new continuous spectrum of helium. Struve and Elvey reported fluorescent clouds of hydrogen and oxygen enveloping portions of the milky way.

The upper atmosphere continues to be the subject of interesting speculation. Adel and Lampland demonstrated by infra-red spectroscopy the presence of nitrogen pentoxide 10 to 25 miles above the earth. Regener of Stuttgart found a high carbon dioxide content 18 miles above the surface of the earth—only five parts per 100,000 less than at the surface. Vertical air convections are held responsible for this anomaly. Laboratory duplication of processes in the upper atmosphere was carried out by Groth and Suess. Water was split into H and OH by light of wave length 1300 Angstroms. Carbon dioxide yielded CO and O. A mixture of water and carbon dioxide gave glyoxal and formaldehyde, as in photosynthesis. From this they concluded that in the beginning of the earth there was water and carbon dioxide, and from these our atmospheric oxygen has been formed photochemically. That there is plenty of far ultra-violet light to do this is shown by the excited nitrogen lines at 600 Angstroms, in the night sky.

An interesting calculation by W. Harkins shows that the stars could have been built entirely from hydrogen, reaching their present ratio of elements in about one hundred billion years. A. Haas, Viennese physicist at Notre Dame, postulated that in the beginning the universe had only three kinds of particles: protons, electrons, and neutrons.

Arizona's famed meteor still lies buried, according to T. Lundberg, who plotted the magnetic variations for a mile around the Crater, and found

anomalies which could be explained only by assuming large masses of magnetic materials. These rich iron deposits may be exploited.

Cosmic Rays and Nuclear Fragments. For cosmic rays and cyclotron studies see **PHYSICS**.

Linked closely with problems of cosmic radiation is the search for those still-elusive particles, the neutrino and the mesotron. Anderson has suggested "mesotron" to replace the variety of names, heavy electron, X-particles, yukon, and barytron. Wilson and Compton obtained evidence of mesotrons in Chicago's underground freight system where, under 50 feet of rock, neutrinos could not penetrate. Street and Stevenson are investigating these mesotrons in a double cloud chamber. In the first chamber, energy and charge of the particle are measured; in the second chamber, a collision with a metal plate occurs. The particle appears to lose its energy in an orderly fashion down to some critical value of several hundred million volts, and then explodes into fragments, losing all of its remaining energy in one lightning holocaust. Thus a particle which has easily smashed through several inches of lead plate may succumb to a sheet of lead only a third of an inch thick. A photograph of such a particle coming to rest appears in *Science News Letter* for July 23, 1938, p. 51. On July 30 Schein and Wilson of Chicago flew to an altitude of 25,000 feet, carrying four Geiger-Mueller counters. They found that mesotrons were produced possibly by the impact of photons on the 2.2 cm. thick lead plates in their counters. In agreement with this was their observation that the proportion of mesotrons was less as the atmosphere became rare. They postulated an altitude of maximum mesotron formation. Blackett of Manchester and Rossi, Italian physicist at Copenhagen, explained that the mesotron is radioactive and has a half life of two millionths of a second. That is why mesotrons appear to penetrate solids more readily than air. The mesotron apparently breaks down into an electron and a neutrino, with the original heavy mass of the mesotron appearing in its offspring as great kinetic energy.

Crane and Halpern presented what they considered the first experimental evidence of the neutrino. By a special technique they were able to show recoil motion after a collision between an electron and a nucleus. Momentum was not conserved, which they claim necessitates the presence of a third body, the neutrino, in the collision.

And now still another particle, the neutretto, has been announced by Compton, *Science News Letter*, Dec. 3, 1938, p. 357. High altitude research by F. Shonka has identified this neutral particle, with mass and properties similar to the mesotron.

Isotopes. The discovery of deuterium by Urey in 1932 and the successful preparation of heavy water on a commercial scale has intensified attempts to concentrate isotopes of other common elements, particularly hydrogen, oxygen, carbon, nitrogen, and sulphur because of their potentialities in biological research. As a result, the year 1938 saw considerable success in the preparation of these isotopes. The original method of electrolysis for the preparation of heavy water still prevails. The concentration of methane containing C^{13} by multiple distillations at two millimeters' pressure was reported by Capron of Belgium who prepared 50 per cent C^{13} in C^{12} . Urey at Columbia has made a thorough investigation of concentration of isotopes by interchange between gas and liquid, described in *THE NEW INTERNATIONAL YEAR BOOK FOR 1937*, p. 134. During the fall of 1938 Urey obtained

8 grams of ammonium chloride containing 70 per cent N^{15} and large quantities of the salt containing lower concentrations of this heavy isotope. On Dec. 5, 1938, he reported successful concentration of C^{13} in HCN gas by interchange with a solution of NaCN. He has also prepared O^{18} and S^{34} in large quantities. And finally he succeeded in partially separating potassium isotopes by chemical exchange with the permutit zeolites. Clusius and Dickel at Munich separated isotopes by passing a gas mixture between concentric tubes, the inner one of which is hotter. Thermal diffusion and convection concentrated the heavier isotope at the bottom of the apparatus. For example, an apparatus 2.3 meters long with a temperature gradient of 600° concentrated, in one step, ordinary hydrogen chloride in which chlorine has an atomic weight of 35.457 to a heavier hydrogen chloride in which chlorine had an atomic weight of 35.56. A mixture of 40 per cent CO_2 and 60 per cent H_2 delivered pure CO_2 at the bottom of the same apparatus. The costs of these heavy isotopes per gram-atom are, today, deuterium \$10, commercial; N^{15} \$180 and S^{34} \$40 for materials used. History will look back to 1938 as the year in which most of these isotopes were first produced in abundance, while research with them in biological chemistry, as well as in many fields of pure chemistry, is still to come. Barbour of Yale reported that white mice die in a week if heavy water is substituted for all of their drinking water. With water containing 20 per cent heavy water their life processes went faster, not slower, as has previously been assumed. Catalepsy was induced in a monkey by application of heavy water to the outside of the brain. La Mer and Maron reported the first case of a change in color upon deuterizing a hydrogen compound.

A new rare isotope of tungsten 180 and a very rare isotope of osmium 184 were discovered. It was proved impossible to detect the isotopes 197 and 203 of mercury. H. Jensen concluded that elements with weights 43 and 61 should not exist. Every element has at least one odd isotope excepting mass numbers 37, 97, 139, and 145.

Nier at Harvard found the relative abundance of lead isotopes, 204, 206, 207, and 208 to vary as much as 15 per cent due to contamination with lead from radioactive sources. Despite this the atomic weight is nearly constant, since those specimens which contain more 206 also contain more 207 and 208. Isotopes 203, 205, 209, and 210 were not found, showing they must be in much lesser abundance than was at one time supposed.

Kinetics. Frecke and Sneed, studying the blackening resulting from the action of ammonium hydroxide on mercurous chloride, a reaction familiar in every elementary analytical chemistry course, is best represented by the equation $2Hg_2Cl_2 + 4NH_4OH = (Hg + Hg_2O + NH_2HgCl) + 3NH_4Cl + 3H_2O$. They actually identified the Hg_2O .

Gurney and Mott applied the quantum theory of solid photo-conductivity to the production of the photographic image. Electrons liberated from halogen ions by the action of light are later captured by metallic silver. These centers then attract mobile silver ions. Other familiar photographic effects were similarly interpreted.

A report of the important general discussion of reactions in solids held at the University of Bristol, England, on April 11-13, appears in *Nature* for May, 1938, pp. 839-40.

Pearson, Purcell, and Saigh described the direct production of the methylene radical. Produced

when ketene is exposed to 2580-3130 Angstroms of light, the methylene has a long life; produced by thermal decomposition of diazomethane, it has a life as short as that of an alkyl radical. The methylene was detected by its reaction with selenium and tellurium. They considered the methylene to be a highly reactive molecule with the carbon in the bivalent state, and not a free radical like methyl.

Kuhn and Birkhofer, from experiments on the catalytic reduction of glucosides derived from secondary bases, have concluded that bases or salts must be formed before mutarotation can occur. It is therefore the cations, not the glucoside itself, which undergo transformation. This brings their views into harmony with those expressed by Lowry.

Medical Miscellany. J. Lawrence, experimenting with mice, found that bones, liver, and spleen in which leukemia cells tend to concentrate, exchange a much higher percentage of radioactive phosphorus than do normal cells. Radioactive iron produced in E. Lawrence's cyclotron was used in tests on anemia. Dogs absorbed the iron into the blood cells via the blood plasma in three days. Non-anemic dogs did not.

A report of the Mellon Institute and the Air Hygiene Foundation showed that sulphur dioxide vapors are relatively slight in air pollution. Average parts per million were St. Louis, 0.128; Pittsburgh, 0.057; Detroit, 0.028; Philadelphia, 0.027; and Washington, D.C., 0.009.

An interesting series of experiments may revolutionize livestock rations. At the University of Wisconsin calves gained 65 pounds on a low-protein diet, 125 pounds on a milk-protein diet, and 105-110 pounds on a diet of low-protein to which ammonium bicarbonate or urea were added. The nutritive value of these seemingly indigestible nitrogen compounds shows that nitrogeous fertilizers of pasture grasses or silage from alfalfa and molasses, which breaks down into ammonium compounds, may be as beneficial as the higher-priced protein rations.

For the first time in medical history the spectroscopy was accepted in testing for a medical product, Vitamin B₁₂, by the American Medical Association.

W. Rose of Illinois listed 10 amino acids essential to growth, and 12 which are non-essential. Cystine, long thought vital, is non-essential.

A. Brewer told of the amazing role of potassium in life and inanimate nature. The radioactivity of K⁴⁰ may control heartbeat, and the germination of seeds, and mutations. Today it is 75 times more likely to cause these changes than are cosmic rays; and in the carboniferous age when K⁴⁰ was still more abundant, it was 375 times more likely. K⁴⁰ is the parent of 99 per cent of the calcium, and 95 per cent of the argon in the world today.

Microscope. Electron-beam microscopes, focused through magnetic, not glass, lenses have improved. Siemens and Halske describe one which realizes a magnification of 30,000 times; and the image is so sharp that it can be further enlarged five-fold by optical means. This is made possible because the wave lengths of electron beams are of the order of 10⁻⁹ millimeters. At the Richmond meeting of the American Association for the Advancement of Science on Dec. 30, 1938, Zworykin demonstrated models of two RCA instruments. The Johnson thermionic wire microscope, using electrons from a hot metal source, magnifies 20,000 times. The Mueller cold emission point microscope procures its electrons by applying a large potential and magnifies a million-fold. With the aid of this supermicroscope viruses, colloid particles,

and giant molecules become visible. The atoms in a crystal of tungsten appear on a fluorescent screen as points of light, and against them can be observed shimmering points due to bombarding air molecules.

Molecular Films. Langmuir and Wrinch continued their defense of the cyclol structure of proteins and constructed a cyclol model for insulin on this basis.

Langmuir and Schaefer presented some interesting experiments with enzymes. An enzyme touched to an oil drop on water immediately spread out upon the surface. Force-area curves were reproducible for any given enzyme, strictly reversible, and showed no hysteresis. Under pressure the drop became a two-dimensional solid, with a pattern characteristic for each enzyme. Thus pepsin was star-shaped. Upon denaturation of the enzyme the pattern disappeared. Langmuir interpreted this to indicate the rigidity of the enzyme molecule itself.

Germer and Storks, observing a monomolecular layer of barium stearate by electron diffraction, found that the hydrocarbon chains although closely packed and practically normal to the surface were, nevertheless, arranged irregularly. With two layers, however, the irregularity disappeared and the molecules fall into characteristic units.

New Substances. E. Wiberg described an interesting inorganic cyclo-hexane, B₆N₆H₆. The N and B atoms alternate around a benzene-like ring. At room temperature this compound is a water-clear, colorless, mobile liquid with an aromatic odor. Like benzene it dissolves fats and pitch, but is much more reactive than benzene, taking up, for example, three molecules of Cl₂, Br₂, OH₂ or, OR. L. McCulloch of Westinghouse produced a crystalline boric oxide with high resistance to heat or shock. Rare earth elements were discovered in hickory leaves by spectroscopic analysis at the U.S. Bureau of Standards. O. Hahn prepared a transuranium element, probably eka-iridium, atomic number 95.

Phosphors without the usual metallic activators were prepared by W. Byler. Calcium phosphate with organic tartrates gave fluorescence comparable with the fluorescence of the teeth. Basic and acid phosphate mixtures increased 5-fold in fluorescent intensity upon proper heat treatments.

Vitamin E, alpha tocopherol, the essence of fertility, was synthesized by Lee Smith and collaborators at the University of Minnesota, associated with Merck and Company. P. Karrer in Switzerland has also produced it. Nobelists Windaus of Göttingen discovered anti-ricketic vitamin D₃, more effective than D₂.

Hucke and Liegel described the preparation of a free-radical containing quadrivalent nitrogen.

Nuclear Energy Levels, see PHYSICS.

Energy levels in the nucleus are the concern of that same group of scientists who a quarter-century ago sketched the energy levels in the planetary electrons. The problem is being attacked from several angles.

(1) Dee and Bothe are studying resonance effects, where collisions are more effective if the incident particle has a certain range of energy. Thus beryllium gives resonance effects at 350 and 670 kilovolts, while fluorine is most efficient at levels corresponding to 330, 470, 590, 670, 860, and 820 kv. The energy range for resonance is broader the shorter the lifetime of the element. (2) Bothe is also comparing the intensity of emission of rays from the same intermediate nucleus. (3) When an excited nucleus returns to stability, different mag-

nitudes of energy are released. Thus oxygen is found to have excited nuclear states at 0.83, 2.95, 3.77, and 4.49 million volts, which agrees with levels previously indicated by bombardment of neon by neutrons. (4) Pool and Campbell bombarded Ag^{106} with fast neutrons; the resulting radioactivity indicated nuclear energy levels. (5) S. Devons studied the scattering of alpha particles by helium, carbon, nitrogen, oxygen, and fluorine, and found resonance peaks corresponding to excited nuclear states. (6) Ellis, Moon, and Wynn-Williams modulated the input to a source of deuterons. This modulated the velocity of the ejected neutrons and in turn their effectiveness as bombarding particles. A simplification of this technique was merely to move the target farther from the neutron source. Maxima in the yield of the target were observed at certain distances from the source, revealing resonance levels in bismuth at 1 and 10 volts, and in lead at 11 volts.

Physical Properties. Low-temperature research is no longer concerned solely with superconductivity. (1) With *non-magnetic insulators* problems involve specific heat, thermal conductivity, etc., and agree well with theories of Debye, Born, and Peierls. With the exception of the anomalous behavior of He-II, this branch of low temperature work is concise, and technical measurements alone remain to be done. (2) With *magnetic insulators*, attention is being directed toward the Debye-Giauque effect, that is, cooling certain paramagnetic substances by demagnetizing them adiabatically. A possible lower limit to temperatures obtained in this way is 0.001°K or less. (3) *Metals* show superconductivity, but no satisfactory theory has accounted for it. F. London's recent theory shows promise. Giauque and co-workers have perfected a resistance thermometer of amorphous carbon for use below 1° Kelvin.

Huffman and Fox have determined the heats of combustion of some compounds important in carbohydrate metabolism, namely, fumaric acid, malic acid, succinic acid, a-d glucose, b-d glucose, and a-d glucose hydrate. Some thermal properties of sulphur dioxide have been accurately measured by Giauque and Stevenson.

Taylor and Coryell have made delicate measurements of the paramagnetic susceptibilities of iron in haemoglobin, making it possible to determine haemoglobin concentrations with high precision.

Thixotropy, the property of tremendously increased viscosity produced by shaking, seems to be universal. Correns and Winkler showed that a multitude of substances are thixotropic if microscopic or sub-microscopic particles of them are dissolved in the proper solvent.

Electron diffraction measurements in gaseous fluorine by L. Brockway showed the internuclear distance to be 1.45 Angstroms, which is 14 per cent greater than the value to be expected for a normal covalent single bond.

Structure of Inorganic Compounds. Infra-red spectrum of nickel carbonyl indicated that the molecule has a tetragonal structure as proposed by Pauling in 1931, although the square configuration indicated in 1934 by Raman spectrum is not completely excluded.

Divalent europium behaves like an alkaline earth metal, intermediate in properties between strontium and barium, according to experiments on the preparation and crystal structure of the sulphide and fluoride by Beck and Nowacki.

By solubility measurements Garrett and Hirschler confirm that red and yellow mercuric oxide are

allotropic forms. Particle size is $1\text{--}10\mu$ for the yellow, and $10\text{--}30\mu$ for the red variety.

R. Jacobs re-investigated the modifications of black phosphorus at high pressures in Bridgman's laboratory.

Evidence has been advanced for a structure of $\text{H}^+(\text{H}_2\text{B}=\text{BH}_2)\text{H}^+$ for boron hydride. Wiberg prepared a supposed diammoniate $\text{B}_2\text{H}_6 \cdot 2\text{NH}_3$, which Schlesinger and Burg regard as a mono-ammonium salt with the skeleton B-N-B. They formed a new salt with this same skeleton, formula $\text{B}_2\text{H}_7\text{N}$.

Pearce and Dawson observed that adding solutions of various chlorides to cobalt chloride widened the blue band usually ascribed to CoCl_4^{--} , or to different degrees of hydration of the cobalt ion. They found the extent of widening was dependent directly on the ionic charge and inversely on the ionic volume of the added cation. From this they concluded that the chloride ions exert an electrostatic attraction which distorts the electronic system of the cobalt to give the blue coloration.

Structure of Organic Compounds. Beach and Stevenson, by electron diffraction studies, demonstrated that the C-C-C angle in tertiary butyl halides is never distorted more than four degrees from the tetrahedral angle. Interatomic distances were calculated for C-C, C-Cl, and C-Br. From X-ray diffraction patterns H. Morss showed that the carbon atoms of a molecular chain in stretched rubber are not coplanar. Last year, E. S. Wallis discovered isocholesterol, an isomer of cholesterol. This year Wallis and Ford showed that the abnormal ethers of cholesterol, heretofore referred to as cis-cholesterol ethers, are really ethers of iso-cholesterol. Also they have substantiated their formula for iso-cholesterol. Staudinger, from a study of the effect of chemical reactions on the degree of polymerisation of starch, advanced fresh evidence in support of the *macro-molecular* constitution of starch, as opposed to the concept of starch as a *molecular aggregate* of glucopyranose residues united by alphasugosidic links.

Recent advances in the organic chemistry of the metals is given in *Nature, Supplement* for Oct. 15, 1938, p. 709. This is a report of papers presented at the Cambridge meeting of the British Association for the Advancement of Science.

Awards and Medals. The first Isaac Adler \$2000 award at Harvard University was presented to W. M. Stanley of the Rockefeller Institute for his isolation of a crystallizable factor, which developed a new approach to the study of viruses. The prize is to be awarded tri-annually for medical research. The American Association for the Advancement of Science at its January, 1938, meeting awarded Philip White of the Rockefeller Institute its \$1000 annual prize for his outstanding paper "Root-pressure, an Unappreciated Force in Sap Movement." The American Chemical Society \$1000 Award in Pure Chemistry was presented at the Milwaukee Meeting in September to Paul Doughty Bartlett of Harvard University, for his studies in organic re-arrangements. The Eli Lilly \$1000 Award in Biological Chemistry was presented on April 18 to Abraham White of Yale for his isolation of a crystalline protein of high lactogenic activity from the anterior pituitary gland. To J. Syverton, 31 years of age, went a \$1000 Eli Lilly prize and gold medal for his outstanding contributions on filterable viruses. Charles Kraus, president of the American Chemical Society for 1939, received a Franklin Institute Award for his researches in liquid ammonia, metal reactions,

and electrolytic solutions. The first Garvan Medal was presented to Emma Perry Carr for her studies of the structure of organic molecules by means of absorption in the far ultra-violet. R. R. Williams, chemical director of the Bell Telephone Laboratories, was given the Willard Gibbs Medal for 1938 in recognition of his work on the isolation and study of the beriberi vitamin B_1 , which led to its commercial manufacture, as "thiamin," by Merck and Company. C. E. Coates of Louisiana State University received the Herty Medal for 1938 for his research in sugar chemistry.

Enrico Fermi, 36-year-old nuclear physicist and mathematician, was awarded the Nobel Prize in Physics for 1938. No award was made in chemistry this year.

At the Milwaukee meeting of the American Chemical Society in September 5-9, Marston T. Bogert was presented with the Priestley Medal. The National Academy of Sciences awarded Willis R. Whitney of the General Electric Company the Public Welfare Medal. On May 13, G. N. Lewis of the University of California received the fifth Theodore William Richards Medal.

The Royal Society made the following awards in 1938: The Copley Medal to Niels Bohr in recognition of his distinguished work on quantum theory and atomic structure; the Rumford Medal to R. W. Wood for distinguished work and discoveries in physical optics; the Davey Medal to G. Barger for researches on alkaloids and other natural products; and the Hughes Medal to J. D. Cockroft and E. T. Walton for their discovery that nuclei could be disintegrated by artificially produced bombarding particles. Sir J. J. Thomson was recipient of the Kelvin Medal on May 3.

For 1939 the Nichols Medal will be awarded on March 10 to Joel H. Hildebrand for his study of thermodynamic and kinetic properties of liquid and solid solutions. On January 6, W. S. Landis will receive the 1939 Perkin Medal for his work on nitrogen fixation, electric smelting, and heavy chemicals.

Political Repercussion on Pure Research. The attitude of the German scientist toward non-Aryan reprisals is formulated by Professor Stark, President of the Physikalischen-Technischen Reichanstalt in Berlin in an invitation article published in *Nature* on Apr. 30, 1938, vol. 141, p. 770. The article is entitled "The Pragmatic and the Dogmatic Spirit in Physics." This year, following the Austrian *anschluss*, the following chemists were dismissed from the University of Vienna: Wolfgang Muller, Fritz Feigl, micro-analyst, Professor Fuerth, physiological chemist, M. Mark, physical chemist, Stephan Meyer, director of the Radium Institute of the Academy of Sciences, and Professor Pauli, colloid chemist. Emil Abel and Otto Redlich, physical chemists, were dismissed from the Technical High School of Vienna. In Czecho-Slovakia the academic research which has been associated with Prague and its ancient university will be impeded for a long time to come, simply because governmental support of research will have to cease. The radium institute developed by the Czecho-Slovak Ministry of Health has been lost. In China only six of the 30 universities have functioned. Nanking University has been destroyed, and the government laboratories there are closed. Scientific meetings have been canceled. The Chinese Chemical Society has suspended publication for a year.

Necrology. Among the many chemists who died

during 1938 were: J. Abel (q.v.) of Johns Hopkins Medical School; R. Bird of Virginia; William Bone of London; W. Cameron, English spectroscopist; Sir Arthur Downes, photo-bacteriologist; J. Katz, colloid chemist; E. Kohler of Harvard; V. Kohlschutter of Switzerland; J. March of Oxford; J. Mellor, English author; Nicola Parravona of Italy; R. Renshaw of New York University; H. Rumage, English spectroscopist; A. Sherman, expert on quantum mechanics; J. Sterba-Bohm of Prague; W. Taggart of Pennsylvania; A. Tutton, English crystallographer; Georges Urbain of Paris; D. Wallace of the University of Pennsylvania. See also NECROLOGY.

CHEMISTRY, INDUSTRIAL. In many countries the advance of science no longer sets the pace for civilization. On the contrary, the year 1938 saw further governmental activity in attaining national self-sufficiency through chemical industry. But private enterprise this year was inhibited by war and political unrest.

Brazil is leading all other South American countries in rapid expansion. Its manganese ore deposits are inexhaustible, and it is the chief source of zirconium. Its iron ores are the most extensive in the world; there is also copper and silver. Chief drawback is expensive transportation. Growing industries are the manufacture of rubber goods; artificial silk, which increased from 900 tons in 1932 to 2800 tons in 1937; tung oil, encouraged by the Sino-Japanese war; timbo, for the insecticide rotenone, which has swelled from a \$4730 business in 1934 to \$200,000 in 1937; development of aluminum and phosphate fertilizer from phosphorus bauxite; and products from corn, one of Brazil's greatest crops. These native industries will be pro-

noted by a research council SAPIA, formed in 1938.

On February 25 an important treaty was signed with Bolivia for the study of Bolivian petroleum fields. There are no oil fields in Brazil, although coal, shale oil, boghead coal, and water-power are abundant. Only 72,000 tons of native coal were used in 1937; 1,700,000 tons were imported. To develop the national industry a law has now made it obligatory to mix 20 per cent national coal with imported coal. Petroleum has been declared a public utility, to cut down the annual million-ton import of petroleum; and the substitution of local shale oil, alcohol, and producer gas is being encouraged. The movement toward local petroleum refining, encouraged by high tariffs, is toward erection of complete refineries rather than simple distillation units.

Chilean nitrate production for 1936-37 was 206,000 tons; world consumption 2,675,000 tons; utilized for fertilizer 2,344,000 tons. Shipments to the U.S.A. increased 28 per cent, and equaled shipments to Europe.

China. For the first part of 1938 industrial conditions in south and west China were undisturbed. The August, 1937, hostilities in the Peiping area effected little destruction of industrial plants, most of which have now been taken over by Japanese interests. Serious destruction has been reported in Tsingtao around Shanghai, also, and in Wusih, often spoken of as the Pittsburgh of China. Shipment of manufactured goods and raw materials was seriously hampered by blockade and by use of the railroad to transport food. Shipments of tung oil by railway via Hong Kong, source of 90 per cent of the world's supply, has continued during hostilities. Japanese perilla oil trade is replacing chinawood oil exports from China, a trade greater than tea and silk. China's tungsten monopoly is being displaced by U.S.A. molybdenum. A wild tungsten boom resulted in the publication of the British White Paper on rearmament in February, 1937. Outbreak of the Sino-Japanese war skyrocketed tungsten prices to only a little below silver.

The Japanese government had hoped that the occupation of China would give them much coal and salt. However, captured collieries were flooded and damaged so as to be unworkable. Production in the famous North China salt fields has dropped to 40 per cent from 1937, increasing Japan's dependence on African territories, a matter of grave concern to synthetic fiber and alkali producers. A great number of "national policy" corporations have been sponsored by the Japanese Army command in China. Japanese pharmaceutical firms have formed jointly a New China Pharmaceutical Company in North and Central China, another blow to German and British interests in China.

Czecho-Slovakia, in the beginning of 1938, saw iron, steel, and coal output surpassing the 1929 mark for the first time; the consumption of fertilizer up; and the ceramic industry one-third higher than in 1937. By the end of the year, however, the Ore Mountains, mineral wealth of Northwest Bohemia, were no longer available to the metallurgical establishments of Pilsen and Prague, and the pitchblende mines of St. Joachimsthal and several plants and research stations of the Aussig Chemical Concern were lost.

Great Britain. Activity in chemical industry was distinctly less in 1938 than in 1937, due to political and economic uncertainty.

New products were: Sodium alginate to replace imported vegetable gums; sodium lactate, a hydro-

scopic liquid as a substitute for glycerol in aging textiles; native fuller's earth replacing imported clays for water softening; methyl cyclohexanol, a substitute for olive oil in textile industries; nicotinic acid; distyrene, the only polystyrene manufactured in Great Britain; sulfanilamide; supersan, a germicide six times more effective than carbolic acid; silverware protected from tarnishing by coating electrolytically or thermally with beryllium oxide or aluminium oxide.

New industrial plants were erected by Courtaulds, for casein wool, the raw material coming from Argentina and New Zealand; by Magnesium Elektron, for the manufacture of magnesium from domestic dolomites instead of from imported magnesite from Austria and Greece; by Combined Optical Industries, for transparent plastics; by the British Oxygen Company in South Wales, a plant manufacturing 20,000 tons of calcium carbide in 1938, equal to one-third of last year's imports; and by Modern Fuels, for the production of benzene and other coal-tar products at Seaham Harbour.

New research laboratories of the Imperial Chemical Industries were in operation by 1938 at Blackley on dyestuffs, at Witton on metals, at Hyde on leather and cloth, and at Slough near London on paint and lacquer.

The eight-pence per gallon tax preference for domestic motor fuels has been extended for 12 years in an effort to stimulate research. A million tons of coal will be treated annually by the Coalite process at the new plant at Wern Tarw, Brigend, South Wales. The main product is smokeless fuel, while gasoline is only secondary.

In **Germany** synthesis of fatty acids by the oxidation of hydrocarbons is of paramount interest. A million tons of fats and oils are imported annually, a quarter of which are utilized in the soap industry. The experimental plant at Witten erected in 1936 produced 20,000 tons of fatty acids from gasoline by-product paraffins in 1937. A second, similar plant is under construction. The synthesis is accomplished in two steps. (1) Paraffins are oxidized over catalysts with a fine distribution of air at 100°C. and a timely interruption of reaction. (2) The unoxidized paraffins are separated from the neutral oxidation products; crude soaps are thus obtained and treated with acid and the resulting crude fatty acids purified by distillation.

Blast furnace construction of the Herman Goering Werke reported last year is to be started shortly. A city of 150,000 inhabitants is rising. Messerschmidt of Gorlitz announced a new method for obtaining alumina and a potash-phosphate fertilizer from potash clays. Steel coated with aluminum is replacing seven tons of copper in each of 350 new German locomotives. Inasmuch as steel is five times less efficient than copper in conducting heat, this is a good example of the extremes to which a country will go in a program of self-sufficiency. Manganese, heretofore discarded as road-ballast slag, is to be recovered by the Iron Research Institute in quantities which may obviate importation.

Textile news includes Vistra HT, a wool-like fiber with a corkscrew surface; Aceta fiber, which because of an air center has a specific weight of only one; and a fish-wool made from 50 per cent fish albumin and 50 per cent cellulose, coagulated so that the thread has a core of cellulose and a sheath of albumin.

K. Dietrich has found that certain strains of yeast will produce crude protein from nitrogenous mineral salts plus carbon compounds such as

ethyl alcohol, glycerin, and lactic acid. Does this envisage meat from air, coal, and water? Beck obtained a 99 per cent yield of nitric acid from liquid nitrogen peroxide, oxygen, and water at 50 atmospheres pressure.

By the end of 1938, Germany was removing 44,000 tons of sulphur annually from coke-oven gas. An increased sale of purified gas will probably bring production of sulphur above 100,000 tons next year. Huge quantities of calcium carbide are being produced by 20,000 kilowatt electric furnaces. There will be a 50 per cent increase in the recovery of phenol from coke-oven waste water; value, 2,230,000 RM. Buna L is replacing natural caoutchouc on an extensive scale. Domestic cultivation of soybean is being encouraged in southern Germany. Cellulose from brown coal wastes was proposed by Professor Beyschlag, and since a million tons of cellulose could be produced annually by this process, it is being examined carefully.

A report of the success in gassification of coal by oxygen under pressure in a plant erected at Zittau in 1936 is given in the *Journal of Industrial and Engineering Chemistry, News Edition*, for Oct. 10, 1938, p. 535.

India, a land not blessed with mineral wealth, nevertheless has a bright future ahead. A National Planning Commission is to be formed to protect native industries. These include the soap industry, which produced 70,000 tons from 1000 factories, and anticipates further expansion when the caustic soda factories are completed in Bengal and Madras; production of paper from bamboo, although the country is a poor paper consumer and the process gives only a 50 per cent yield versus 90 per cent from mechanical grinding of wood; textile starch from maize; acetic acid and activated carbon from bagasse and molasses; alumina and sulphur trioxide from heating native gypsum-bauxite ores, sponsored by joint action of British and Canadian companies; glass at Mysore, possibly utilizing native orthoclase feldspars in place of soda ash; and governmental regulation of imported drugs and medicines to protect Chemical, Industrial, and Pharmaceutical Laboratories, Ltd., established in 1937. At present there is relative over-production of coal, jute, sugar, and cement. Biggest 1938 project is the Alkali and Chemical Corporation plant for soda ash at Kheura, Punjab, and caustic soda and chlorine near Calcutta.

Italian chemical industry has solved serious and difficult problems. Production rose in 1938 from 99.6 to 137.8.

The Italian sulphur sales in the fiscal year 1936-37 were 10,000 tons above 1935-36, surpassing all sales for the past twenty years. Only 26.5 per cent was retained for national consumption. Electric ovens have been substituted to replace a yearly consumption of 3,000,000 tons of coal. On June 23, 1938, operations began on Tuscan lignites for the production of fertilizers. The new industrial zone at Bolzano will produce 15,000 liters of absolute alcohol daily, 2000 tons of magnesium, and 2300 tons of magnesium alloy per year.

Synthetic fiber production for 1937 was 120,000,000 kilograms, compared with world production of 740,000,000 kilograms. This places Italy first among European producers. Ninety per cent of the country's fiber is manufactured by a federation of Italian companies. Native raw materials are constantly being sought, including hemp (1,200,000 quintals), flax (50,000 quintals), and cotton (43,300 quintals). Other fibers are ramie, now imported from China; gelsofil from mulberry bark;

and animal protein mixed with cellulose. Domestic wool and natural silk production are insignificant. Lanital from casein consumed over 3000 tons of casein this year. The lanital wool substitute has the composition: C, 53 per cent, H, 7 per cent, O, 23 per cent, N, 15.5 per cent, and S, 0.7 per cent. This compares closely with the analysis of natural wool: C, 48.25 per cent, H, 7.57 per cent, O, 23.66 per cent, N, 15.86 per cent, and S, 3.66 per cent. The process has been licensed in many European countries and in Canada.

The program of economic independence foresees a national production of 4,000,000 tons of Arsa coal and pitchy lignites for 1940, and of more than 3,000,000 tons of other lignites and peat, satisfying 40 per cent of Italy's needs. Another important program under way is the utilization of the coal in the Sardinian basin, where installations with a capacity of 10,000 tons per day are being made. The establishment of the petroleum industry at Trieste has made a noteworthy contribution to the commercial balance of the nation. ANIC plants are to go into production soon to meet half the 2,500,000-ton annual requirements of liquid fuel. The large Aquila mineral oil refinery during the first year of its operation, 1937, produced 350,000 tons of products. A review of the Italian coal and fuel industry for 1936-37 appears in the *Journal of Industrial and Engineering Chemistry*, vol. 16, p. 112, 1938.

The expansion boom in **Japanese** industries passed its peak in May, 1938; and a period of comparative stagnation must be expected. Investors fear increased governmental regimentation under the National Mobilization Law. Japanese chemical plants not producing goods of military importance are feeling the pinch of wartime conditions. There is drastic rationing of raw materials, curtailing production of superphosphates from imported phosphates, calcium cyanide, rubber and tanning goods, cement and building materials, and chemical plant equipment using imported metals. Japanese dyestuff exports have been halved, both because China was formerly the chief consumer, and the diverting of dyestuff plants to munitions. The textile industry has suffered. In the first three months of 1938 rayon production was cut 10 per cent; and scarcity of staple fiber pulp lead to a government curtailment of 35 per cent in carbon disulphide production this fall. Erection of new plants was prohibited. Formalin shortage threatened the plastics industry.

Increased production was recorded in the munitions industries. Caustic soda and chlorine production still increased, salt coming from British and Italian East Africa. Sulphuric acid for fiber and fertilizer industries in 1937 was 4,200,000 tons of 50° Baume, double that of the years 1930-34. Nitric acid capacity for 1938 is expected to be 150,000 tons, double previous years. The Oriental High Pressure Company doubled its ammonium sulphate production. With a capacity of 800,000 metric tons, it is the largest producer in the East. Magnesium output doubled to 11,000 tons, annually. Formosan sugar companies expect to produce 14,000,000 gallons of absolute alcohol from molasses in 1938-39, encouraged by the Alcohol Monopoly law. A plant is to produce 30,000 metric tons of newsprint from sugar bagasse.

A number of processes and products, new for Japanese industry, are rumored. Among them are tetralin for reclaiming waste rubber; synthetic fiber from soybean oil by a method developed by Ryogei Inouye, inspired by the German fish-oil-cellulose fibers; activated carbon; photographic

gelatin; Bristics, a tubular viscose filled with stiffening material, a substitute for Chinese pig bristles; a neoprene-like substitute for rubber, one of Japan's greatest expenditures; butanol and acetone from potato fermentation; hydrogenated fish oils converted into glycerates as a quick-drying oil; glass spinnerets replacing platinum in the rayon industry; artificial wool by the Italian casein process; and rotary kilns for pig-iron production, used successfully in Barcelona. The government has supported a project of 20,000,000 yen to produce salt, caustic soda, potassium bromide, gold, and chlorides from the electrolysis of sea water.

Manchurian industries are furnishing coal-tar products, caustic soda. At Hachinohe phosphate rock from Manchuria is to be converted into aluminum sulphate, and reduced by ammonia at 1200°C. to aluminum oxide. This is subsequently treated by the usual electrolytic method. Annual production will be 5100 tons of aluminum, 25,800 tons of ammonium sulphate, and 20,000 tons of fertilizer containing 20 per cent phosphoric acid and 16 per cent of ammonium sulphate.

For a table of business promotion in Japan for 1931-37 see News Edition, *Journal of Industrial and Engineering Chemistry*, vol. 16, p. 303, 1938.

Palestine exports in 1938 doubled over any previous year, reflecting the unbroken growth of the country's business. There are 157 chemical plants and 168 active chemists in Palestine. Palestine Potash Ltd. realized full capacity operations of its southern works early in 1937, but is not attempting to produce magnesium from Dead Sea salts. A petroleum refinery to handle 2,000,000 tons of crude oil will be erected between Haifa and Akko; and plans are completed for a three-year construction program. Crude oil exports in 1937 were 2,057,226 tons via Tripoli, and 1,900,651 tons via Haifa. Formerly the crude oil went mainly to France; now Great Britain takes the larger part of it. A review of the possibilities of industrial development in Haifa have been described by Menchiakovsky in the journal *Palestine and the Near East*.

Sweden reported an experimental factory to produce salt from frozen sea-water. Wall slabs are being made by treating molten blast-furnace slag with steam and lime at 160°C. for 10 hours. Large deposits of ore containing 60 per cent iron and 10 per cent titanium were reported in **Finland**. An international symposium on the chemistry of cements was held in Stockholm on July 6-8.

In the **United States** one quarter of all industry is chemical. Production records were established by paint exports, \$21,500,000 in 1937, highest in seven years; tung crop, 10,000 tons, giving 2000 tons of oil equal to 5 per cent of the U.S. paint requirement, and cutting into the \$20,000,000 tung oil business transacted with China in 1937; bromine in 1937 up 30 per cent over 1936; 40 per cent of the world's borax and boric acid, and substantial amounts of soda ash and salt cake from the strong brines in Searles Lake; 40 per cent of American potash needs in 1937 from Trona; and 15,000 tons of manganese from the Philippine Islands shipped to Japan in 1938, compared with initial production of 225 tons in 1936. Synthetic acetic acid first produced in 1928 now furnishes 70 per cent of the acid used for cellulose acetate. U.S. Steel completed a decade of research under John Johnson, spending \$8,400,000 to achieve closer control of large-scale processes. On December 15 it opened its \$45,000,000 Irvin Works near Pittsburgh, the most ambitious industrial construction job since the depression.

The Federal Food, Drug, and Cosmetic Act, to

further protect the consumer, became a law on June 25, 1938.

The Geological Survey discovered the first platinum ore of any size in the United States, in copper ores 21 miles northwest of Durango, Colorado. A gold rush at Cimarron, 29 miles north of Tonopah, Nevada, followed the discovery of ore worth \$2000 a ton.

Activities of the Mellon Institute for 1937-38 resulted in barium oxide from barium sulphate, Hommelaya non-chipping vitreous enamel, EBP slow-burning fuse powders, non-smoldering safety fuses, Garspar silica for ceramics, and Fluxtite silicate block with good corrosion resistance.

At the fourth Chemurgic Conference, held this year at Omaha on April 25-27, the Forest Products Laboratory at Madison, Wisconsin, reported walnut-shell flour furnishing outlet for more than 10,000 tons of waste material, and conversion of lignin into wood alcohol, lacquer solvent, and plastics by hydrogenation. Lignin, waste product of the paper and rayon industries, comprises about 25 per cent of the stems of trees.

Agriculture. Soilless farming on barren Wake Island has, this year, provided half a dozen crops for trans-Pacific Clipper passengers. The U.S. Department of Agriculture announced a rapid dehydrating process for vegetables. By treatment with a gas of fat-dissolving vapor such as sulphur dioxide or chloroform, cells are destroyed and the evaporation of water facilitated. The Department also discovered that treatment of dormant lettuce seed with thiourea induced germination.

Fuels. European countries continued to produce synthetic motor fuel. In Germany 54 per cent of the fuel consumed in 1938 was synthetic. The corresponding figure for all of Europe was 25 per cent. Some substitutes for natural gasolines were: (1) The direct hydrogenation of coal at 300 atmospheres and 500°C. over catalysts in England produces 1,300,000 barrels a year. With a reasonable allowance for amortization and interest, a plant can manufacture 150,000 tons of gasoline a year, octane rating, for 18 cents per gallon. (2) The hydrogenation of carbon monoxide is a process discovered by Fischer and Tropsch some fifteen years ago. The original process passed water gas, freed from sulphur, over an alkali-iron catalyst at 450°C. and 150 atmospheres. The product, known as Synthol, could be cracked to form hydrocarbons called Synthene. Recently it has been found that the oxygen content of the product can be eliminated by operating with hydrogenation catalysts at low temperature and pressure. This is meeting with especial favor in Germany, which will shortly have an annual capacity of 17,000,000 barrels from this and the preceding method. France is producing 110,000 barrels a year. The Fischer-Tropsch process, although 3 cents per gallon more, has several advantages over the direct hydrogenation of coal. The catalytic process is carried out at atmospheric pressure and the relatively low temperature of 200°C. The units are small, and may be scattered over the country-side for operation by relatively untrained technicians, a war-time advantage, whereas the direct hydrogenation is an elaborate, high-pressure, rigidly controlled plant process. The German product, called Kogasin oil, is a mixture of motor fuel, kerosene, Diesel oil, and paraffin wax. Germany will be capable of producing 530,000 tons yearly, by this method, and France 13,000 tons, when plants now under construction have been completed. The significance of the Fischer-Tropsch process to the United States of America is that some day it may

convert the methane now lost into the air from our natural wells into gasoline. Meanwhile, natural crudes distilled, cracked, and polymerized to yield high octane rating will undoubtedly supply North America for many years to come, at a cost much lower than the synthetic product. (3) Benzene from coal, octane rating 90, has been encouraged because of its potentialities in time of war for the manufacture of explosives. (4) For the same reason governments have subsidized or made mandatory the admixture of alcohol from beet sugar to gasoline. During 1938, however, due to shortage of foodstuffs, most laws compelling the use of alcohol in motor fuel were rescinded so that a sharp decline in power alcohol consumption occurred. (5) Compressed methane has been substituted in 1938 for over 150,000 tons of gasoline in Germany, and 100,000 tons elsewhere, chiefly in Italy. There are 25,000 cars using these compressed gases in Germany today, and filling stations are scattered everywhere. The cost of providing the necessary mixing valves from gas cylinder to gasoline intake of an ordinary gasoline engine is about \$200. (6) The *reductum ad absurdum* in gasoline substitute is the wood-burner. Chiefly in France, 200,000 tons of wood replaced 33,000 tons of imported gasoline. France's yearly wood crop would satisfy only 10 per cent of its gasoline needs. Nine thousand vehicles on the Continent have attachments for converting wood into producer gas, which is then burned in the ordinary gasoline engine. (7) Oil shales occur in Great Britain, Estonia, Finland, France, Latvia, Sweden, Spain, and Czecho-Slovakia. However, the total production in 1937 from shale was only 26,000 metric tons in England and 12,800 in all other countries. (8) Ammonia, hydrogen, and acetylene have also been tried, but with little success.

Insecticides. Rotenone has been discovered in roots of devil's shoestring, a pea plant growing along the Atlantic seaboard of the United States.

Isobutyl undecylenamide, a fly-spray substitute for pyrethrum, is being produced by DuPont from alcohol and vegetable oil. One-half of one per cent in refined base oil plus about one-fifth the pyrethrum normally used, furnishes a fly-spray of toxicity equal to preparations containing only pyrethrum. Kenya, in East Africa, is now growing pyrethrum and threatening the Japanese monopoly which controls 95 per cent of the material.

Methyl bromide is more toxic than hydrogen cyanide for larvae, moths, and granary pests. Benzol checks blue mold in Virginia tobacco.

Metallurgy. Ebner has extracted magnesium from sea-water. Starting with magnesium chloride, chlorine is removed by hydrogen at the relatively low temperature of 1200°C. Italian bauxite, hitherto useless because of high iron content, has been rendered usable for wartimes by Fink and de Marchi of Columbia University. The ore is heated with sulphur. Chlorination of the sulphide at 920°C. removes 94 per cent iron, 66 per cent sulphur, but only 7 per cent aluminum. This method probably will not compete with peacetime treatment of ordinary red bauxite, however. A. Newall, in London, produced lead and sulphur by the electrolysis of galena in molten lead chloride. Power and Davies of London added soap and carbon disulphide to silver plating baths, which deposited sub-microscopically fine-grained silver which requires no further polishing.

Indium electroplated on surface bearings in motor cars is more satisfactory than Babbitt metal. Liddiard of the British Non-Ferrous Metals Research Association described interesting alloys formed by melting powders under pressure. For example,

tungsten with a small quantity of copper and nickel gave an alloy with a density of 16.5 for protection in radiotherapy. Copper with tin or graphite gave a self-lubricating alloy.

Petroleum Products. Oil became a raw material for cyclic hydrocarbons and glycerol in 1938, an event of considerable importance.

Gustav Egloff at the Richmond meeting of the A.A.A.S. in December, reported the cyclization of chain compounds by catalytic processes similar to that already patented by Moldavski and Kamusher. H. S. Taylor at Princeton has also been producing toluene from heptane. The Universal Oil Products Co. has commenced plant production of toluene from heptene.

Glycerol is used in the industrial world by the tobacco, paint, plastics, rayon, and cellophane industries, the latter two industries alone consuming more than 10,000 tons of glycerol each year. It has been produced chiefly by fermentation of blackstrap molasses. But recently a method involving the chlorination of propylene from cracked petroleum has foreshadowed an important industry of the future. Allyl chloride is formed and may then be transformed into glycerol via (a) 1, 2, 3-trichloropropane, or (b) dichlorohydrin, or (c) allyl alcohol and glycerol monochlorohydrin. One oil-refining company has already installed equipment and indicates that production cost will be under six cents per pound.

Photochemical. Luminescence under ultra-violet light has found many industrial applications. For example, the shells of fresh eggs fluoresce red; of old eggs, blue. Invisible spots of insoluble calcium soap on laundered goods emit a blue fluorescence under ultra-violet light. Also, laundry can be stamped with invisible ink, and the number identified by its fluorescence under ultra-violet light. Uses of X-rays to "candle" fruits for juice content has become standard practice.

Lamps using ultra-violet light and fluorescent chemical-coated walls to produce pastel shades of light are now on the market. The General Electric Company is producing 13 miles of these "Lumiline" lights for the New York World's Fair. A lamp consuming 15 watts appears brighter than a 40-watt filament bulb, and has a much longer life. Westinghouse manufactures a tiny 1000-watt mercury arc light one-fifth as bright as the sun for photographic work, searchlights, and therapy. A thermal microscope permitting photographing crystal changes at temperatures as high as 3632°F. was described by F. J. Tone.

Plastics. In a posthumous patent to the DuPont Company, Ellsworth describes a moisture-proof, water-insensitive, transparent wrapping film consisting of partially etherified cellulose. It may revolutionize the wax coatings of dairy products. E. Hauser prepared strong transparent wrappings similar to cellophane from bentonite clay jellies. In Germany, Bekk and Strunk have introduced a thermoplastic printers' type of greater durability than metal type. Moulding powders from tannin waste shows considerable promise, according to Sir Gilbert Morgan. Transparent splints, and dental instruments of methyl methacrylate, which bends light around into the patient's mouth, were exhibited.

Rubber. Most important event in this field in 1938 was the transfer of the Thiokol plant from Trenton, N. J., to the Dow Chemical Company at Midland, Michigan. The latter had previously supplied the Thiokol Corporation with most of the raw materials. Ten thousand tons of Dow Thiokol will

reach the market each year, while the Thiokol Corporation will continue to maintain its research and sales development activities in Trenton. The three basic steps in the manufacture of thiokol are (1) the manufacture of polysulphide, (2) reaction of this with ethylene dichloride to form synthetic rubber latex, and (3) coagulation of the latex to form rubber crumbs.

"Cordura," a DuPont heat-resistant cord for tire fabrics, has gone far to increase truck-tire mileage.

Textiles. Based on a posthumous patent of Wallace Carothers, DuPont Company is prepared to produce by 1940 a remarkable new fiber, at an \$8,000,000 plant now under construction at Seaford, Delaware. Castor oil is converted into soap and then to sebacic acid. This acid is then reacted with cadaverine, a product of the decay of lysine in blood protein of the human corpse. The industrial source of cadaverine is coal-tar. Completely synthetic, the new fiber is a polyamide with protein-like structure, as in natural silk. It can be drawn to one-seventh the diameter of silk; its tensile strength is at least as good as silk; it is elastic, and it is insensitive to moisture. High twist Nylon will be ideal for knitted wear, including stockings. Coarser fibers will be used for toothbrushes, which indeed have already appeared as "Exton"; for mohair substitutes; for dental floss, etc. Thus the United States takes a step forward in its freedom from foreign silk.

The Department of Agriculture is making a fiber which differs from Italian lanital in that it can utilize more grades of raw casein, and has a lower sulphur content than real wool. The process may consume a billion pounds of casein annually. Cost of the fiber is fifty cents per pound, approximately the same as rayon.

Awards and Medals. The Bessemer Gold Medal for 1938 of the Iron and Steel Institute was awarded to C. H. Desch.

The Chemistry Industry Medal was presented to J. V. Dorr on November 4, in recognition of his inventions which have made possible low-cost production on a large scale. The 1939 John Fritz Gold Medal, highest engineering honor, was awarded to Frank Jewett of the Bell Telephone Laboratories in recognition of his vision and leadership in industrial research and development in communication. He also received, on May 5, the Washington Award for 1938.

The Institute of Metals Medal for outstanding services to non-ferrous metallurgy was awarded to William Bragg.

The Longstreth Medal of the Franklin Institute was presented to C. W. Balke for his work on the production and commercial utilization of columbium and tantalum. The Messel Medal was presented to L. H. Baekeland at Ottawa, Canada, on June 20. H. C. Christensen was given the Remington Honor Medal on November 30 for his contributions to pharmacy. The Schoelkopf Medal was awarded in May to Sterling Temple, chemical director of the Rensselaer and Hasslacher Chemical Department, for his direction of work in chlorine chemistry.

Awards at the Verein Deutsche Chemiker at its fifty-first convention in Bayreuth on June 7-11 went to K. Adler who received the Emil Fischer Commemorative Medal for diene synthesis; to E. Zintl, the Liebig Commemorative Medal for work on intermetallic compounds; and to Elizabeth Dane, the Duisberg Prize for stearin research.

Necrology. Among the many industrial chemists who died during the year were: H. Ahlquist, consulting engineer; W. Barclay, English metal-

lurgist; H. Brown, alkali expert; C. Carpenter, English gas engineer; J. Compton, carbide and carbon engineer; E. Dehnelt, of the Luennwerke, Germany; C. Édouard Guillaume (q.v.), Nobel prizeman of invar fame; R. Hawn, Monsanto phosphorus manager; C. Herty (q.v.), inventor of Georgia pine newspaper; A. Hirsch, expert in pyrophoric alloys; L. Lilienfeld, Italian brain surgeon and cellulose chemist; H. Hooker, chemical manufacturer; A. Hutchinson, president 1937-38 of the Iron and Steel Institute; G. Mackay, of the American Cyanamid Company; Sir Robert Mond, of the International Nickel Board; Charles Munroe (q.v.), last surviving charter member of the American Chemical Society, inventor of smokeless powder; G. Raynor, of the Carborundum Company; C. Reese, of the Vanadium Corporation of America; C. Schluederberg of Sperry Corporation; Professor Schwalbe, German cellulose chemist of "copper number" fame; J. B. Senders, French co-worker of Sabatier (Sept. 26, 1937); R. Thiessen, of the Bureau of Mines; W. Tichnor, of Commercial Solvents; T. Tullock, exploiter of the Dead Sea mineral wealth; R. Vondracek, Czecho-Slovakian fuel expert; E. Wilson, of the Rumford Chemical Works; Fritz Wust, of Germany; and F. Zeisberg, president of the Institute of Chemical Engineers, authority on nitrogen and high-pressure gas technique. See also NECROLOGY.

CHICAGO. See ILLINOIS; RAPID TRANSIT.

CHICAGO, THE UNIVERSITY OF. An institution of higher education and research in Chicago, Ill., founded in 1890. The university is privately endowed, co-educational, and non-sectarian, although not less than three-fifths of its 35 trustees must be members of Christian churches, and of this three-fifths, a majority must be members of Baptist churches. On Oct. 1, 1938, the members of the faculty, exclusive of assistants and of teachers in the laboratory schools, numbered 841. In all departments and in all grades of service the university employed approximately 4500 persons.

During the summer quarter, 1938, there were 4432 students enrolled, of whom 2144 were men and 2288 were women. In the autumn quarter, 1938, there were 7842 students enrolled in the university; 4572 were men and 3270 were women. Of this number 3944 men and 2302 women were enrolled in the Divisions and Professional Schools and 628 men and 968 women were enrolled in the University College (downtown division offering evening and Saturday courses). Of the total enrollment for the autumn quarter, 1938, 1837 men and 1024 women were classified as graduate students; 2039 men and 1198 women were classified as undergraduate students; 68 men and 80 women

were classified as students-at-large. The total enrollment for the academic year 1937-38 was 11,867. The Home Study, or correspondence department, had an average enrollment of 3797, which is exclusive of the totals given above. During the academic year the university granted 1850 degrees. Of that total 409 were Master's degrees and 160 were Doctorates of Philosophy.

The total funds held by the university as of June 30, 1938, amounted to \$125,691,629, an increase of \$4,053,280 over the same figure for the same date in 1937. These funds were divided as follows: Endowment, \$70,429,492; plant, \$44,291,619; other funds, \$10,970,518. The total income of the several divisions of the budget was \$8,215,016, an increase over income of the previous fiscal year of \$557,657. This total of budget income does not include income of auxiliary enterprise such as residence halls, commons, bookstore, and student social facilities. Including such activities, the total current income for 1937-38 was \$10,722,976. The total amount of gifts paid in was \$6,655,650.

The University of Chicago Press published 75 books during the academic year, 1937-38, in addition to 32 paper-bound books and pamphlets, the annual proceedings of 6 professional societies, 3 maps, and 16 scholarly journals. Six new educational sound films have also been issued this year, two in the biological sciences, three in chemistry, and one in physics. These films were produced by Erpi Classroom Films, Inc., under the scientific direction of University of Chicago faculty members.

The International Encyclopedia of Unified Science, Otto Neurath, editor, was inaugurated. Now being published are the first 20 monographs which will constitute Volumes I and II of the *Encyclopedia, Foundations of the Unity of Science*. Publication of Part V of *The Dictionary of American English* from "Chubby Eel" to "Corn Patch" completed Volume I.

Among the larger individual gifts of the year were one of \$50,000 from the International Education Board for continuation of excavation of Megiddo by the Oriental Institute; \$75,000 from Mrs. Marion R. Stern, for educational purposes; \$50,000 from the Carnegie Corporation for the Graduate Library School; \$35,000 from the Alfred P. Sloan Foundation for experimental work in broadcasting of economic information; and a conditional grant of \$1,500,000 from the Rockefeller Foundation to endow research in biological science. The university must supply \$500,000 in matching funds before June 30, 1941; in the interim the Foundation is providing \$180,000 annually for such research.

The new building for public administration groups (see *YEAR BOOK*, 1937) was completed and occupied. Grinding of the new 82-inch mirror for the MacDonald Observatory of the University of Texas, staffed by Chicago, was completed, and installation is scheduled for the spring of 1939. Prof. Arthur H. Compton announced tentative conclusions indicating that cosmic rays do not originate outside the earth's galaxy. Awards of \$1000 for excellence in teaching of undergraduates, endowed by an anonymous alumnus, were awarded for the first time to William T. Hutchinson, associate professor of American history; Joseph J. Schwab, instructor in biological sciences in the College, and Reginald J. Stephenson, instructor in physics.

Additions to the faculty numbered 76, including Dr. Eduard Beneš, former president of Czechoslovakia, as visiting professor under the Charles R. Walgreen Foundation; Morris R. Cohen as

professor of philosophy; Lord Bertrand Russell as visiting professor of philosophy, autumn, 1938, and winter, 1939; Ralph W. Tyler as head of the department of education; Dr. James Franck, co-winner of the Nobel prize in physics, 1926, as professor of physical chemistry; Lindsay Rogers as visiting professor under the Walgreen Foundation, spring, 1939.

The libraries added approximately 37,000 bound volumes, for a total of 1,232,745. The Harriet Monroe Library of Modern Poetry, of 2350 volumes selected by Miss Monroe while editor of *Poetry*, *A Magazine of Verse*, together with her correspondence, was formally dedicated. President, Robert M. Hutchins, LL.D.

CHILD LABOR. Trends in Child Labor. Over a period of a number of years, the Children's Bureau, as a result of the receipt of comparable statistics from a number of states and cities, which were based upon the issuance of working permits to children, was able to indicate a series of significant trends in the employment of children. These figures showed the following: (1) That fluctuations in child labor corresponded to the general pattern of business activity as indicated by the index of employment in manufacturing. Thus, during the first six months of 1929 there was an increase in the number of work permits issued when the index of employment in manufacturing industries also rose. Beginning with the last six months of 1929, child labor declined steadily just as the index of factory employment declined. This decline continued during the period of the NRA. In this case, despite a general upturn in factory employment, the determining factor here was the barring of child labor under the codes. When code restrictions were removed in June, 1935, child labor immediately started to rise and fall with the index of factory employment. (2) During the period of the NRA, when there was a marked decrease in the employment of children under 16 years, there was an increase in the employment of 16- and 17-year-olds. (3) As soon as the NRA was declared unconstitutional, child labor once more moved upward. Thus, the number of work permits for 14- and 15-year-olds increased 150 per cent during the first five months of 1936 compared with the first five months of 1935. (4) There was a decided shift in the occupations children entered. While all permits did not give occupational data, on the basis of partial returns, nevertheless it was possible to indicate that less than 20 per cent of the 14- and 15-year-olds securing work permits in 1936 entered manufacturing, as compared with 50 per cent in 1929.

Mr. Homer Folks, Chairman of the National Child Labor Committee, was able, therefore, to summarize the situation in 1938 as follows: (1) There was a rapid and alarming increase in industrial child labor following the invalidation of the NRA. (2) There was a gradual occupational shift of working children from manufacturing occupations (which were susceptible to state regulations) to those in the personal-service field (which were less easily controlled under existing state legislation). (3) There was no indication that the number of children engaged in industrialized agriculture had decreased materially. There was a possible exception in the case of the sugar-beet fields, where employment standards for children of contract laborers were included in the requirements set for benefit payments as authorized under the Jones Sugar Act of 1937. (4) There was no indication that the employment of children in street

trades had diminished. (5) On the basis of figures and trends, Mr. Folks was prepared to estimate that the total number of children under 16 gainfully employed in 1938 was approximately 850,000. In addition, there were over a million boys and girls 16 and 17 years gainfully employed, that is to say, nearly one in every three of this age group. Mr. Folks pointed out that, particularly in the 16- and 17-year groups, the persons here should not necessarily be considered child laborers and therefore barred from employment. There were, however, many boys and girls under 18 engaged in occupations which were especially hazardous as well as many who worked under sweatshop conditions of hours and wages. He said, therefore:

When we consider these facts and their full implication, we recognize that, despite the notable progress already made, the long fight to end child labor still has an uphill road ahead. There can be no question but that child labor is still a grave problem in this country. It seems likely to require more, not less, protective legislation in the future.

Although significant advances in state legislation were made in recent years aiming at the prevention of the industrial employment of children under 16 years of age, there were still 38 states permitting children of 14 or 15 years to leave school for work. In this connection, the *Monthly Labor Review* declared:

Experience under the national minimum-age standards of the NRA codes showed that industry could easily replace these young people with older workers. More and more the general public is coming to the view that it is socially wasteful to allow children of 14 and 15 years to cut short their school training to take up jobs that in general are poorly paid and of little training value, and more and more forward-looking employers are coming to see the advantages of employing boys and girls of 16 and over rather than those of 14 and 15 years.

Progress continued to take place in the States themselves. During the legislative period September, 1937–September, 1938, notable advances took place in *North Carolina* and *South Carolina*, both of which adopted a minimum age of 16 for factory employment at any time and for all work during school hours. In *North Carolina* a minimum age of 14 years was set for work outside school hours in non-factory employment. A 40-hour week for children was established, improved night work prohibitions were adopted, and the employment of minors under 18 years of age in hazardous occupations was prohibited. The *South Carolina* law established a 16-year minimum age for factory or mining employment at any time and for any employment during school hours. The prohibition of night work for minors under 16, which had formerly applied only to work in factories, was applied to all other occupations except agriculture and domestic service. *Wisconsin* strengthened its child-labor law, adopting for minors of both sexes under 18 a maximum 40-hour week and for minors under 16, who were prohibited employment during school hours, a 24-hour week. In *Vermont* a minimum age of 14 was extended to cover work in any gainful occupation during school hours and a 9-hour day and 50-hour week was set up for minors aged 16 and 17. *Pennsylvania* and *South Carolina* raised the age limit for compulsory school attendance to 16 and 17 years respectively, while *Oklahoma* and *Wisconsin* made attendance of children of school age for the entire term compulsory throughout the year. Legislation affecting the control of industrial homework was passed in *Connecticut*, *Illinois*, *Massachusetts*, *Pennsylvania*, and *Texas*. The States of *Missouri*, *New York*, and *Vermont* passed legislation prohibiting the sale of child-made goods.

It should be further noted that *Wisconsin*, in amending its child-labor law, became the first State to adopt the maximum 40-hour week for minors of both sexes up to 18 in all gainful occupation except agriculture and domestic service. *South Carolina* further amended its statutes to prohibit the work of minors under 18 between the hours of 10 p.m. and 6 a.m. *New York* extended the application of the 8-hour day, 44-hour week, and 6-day week to minors under 16 in beauty parlors. Also, during the year minimum wage laws were passed by two States, *Kentucky* and *Louisiana*. The *Kentucky* law applied to women and minors of both sexes and the *Louisiana* law applied to women and girls. This made a total of 25 States having minimum wage legislation on their statute books.

Fair Labor Standards Act of 1938. The Fair Labor Standards Act of 1938, which went into effect on Oct. 24, 1938, had both a direct and indirect effect upon child labor. Directly, it gave the Children's Bureau control over the employment of children engaged in gainful activity, entering into interstate commerce, during the years 14 through 17, as will be indicated in greater detail below. Indirectly, by providing for the raising of standards of living for underpaid and overworked labor, through its minimum-wage and maximum-hour provisions, the law provided for a more adequate economic basis for the rearing of children.

Under the new law, the enforcement of the child-labor provisions was placed in the charge of the Children's Bureau. The law excluded all children under 16 years of age from employment in those occupations covered by the Act, that is, all work in establishments producing goods for interstate commerce. A proviso was laid down in the case of the employment of children 14 and 15 years of age at work other than in manufacturing or mining, which, at the discretion of the Chief of the Children's Bureau, could be excluded from the prohibition if such work did not interfere with the schooling, health, or well-being of the children. In addition, the law excluded children 16 and 17 years of age from occupations in such establishments as might be found by the Chief of the Children's Bureau to be hazardous or detrimental to health or well-being. Child actors in motion pictures or theatrical productions and children employed in agriculture during periods when they were not likely to be required to attend school, were exempted from these provisions.

Pursuant to this authority, the Chief of the Children's Bureau issued a series of regulations. Regulation No. 1, relating to certificates of age, provided that an employer might protect himself against unwittingly employing minors by obtaining a certificate of age for each minor 16 or 17 years of age so employed. If the employment was in an occupation declared to be particularly hazardous for minors 16 and under 18 years of age, certificates of employment for minors 18 or 19 years of age were to be obtained. Regulation No. 5 was particularly important in view of the fact that it had application to hazardous employment. The regulation called for the establishment of various preliminary steps to be taken before issuance of any order declaring an occupation to be hazardous and therefore affecting the labor of children 16 and 17 years of age. The Chief of the Children's Bureau indicated that orders barring children from hazardous occupations would be made only after careful study and investigation, and after a hearing was held and opportunity given for representatives of both workers and employers to be heard.

By the close of the year no occupations had been declared hazardous nor hearings scheduled.

On November 1, Administrator Elmer F. Andrews of the Wage and Hour Administration announced that newspapers came under the provisions of the Fair Labor Standards Act. Also, on November 12, as a result of hearings held under Dr. William M. Leiserson, the application of the telegraph companies for wage exemptions for messengers was denied. The report also stressed as distinctly hazardous the nature of messenger service and the fact that between 1931 and 1938 no progress had been made in reducing the number of accidents serious enough to involve loss of time. Said Dr. Leiserson in his report:

Considering the responsibilities of the messengers for their own self-support or for the support of dependents, their expenses for shoes and bicycles, their occupational hazards, the bench time, and the temporary nature of their employment, they are not fairly remunerated for the services they render to the companies when they receive less than 25 cents per hour; and the wages they do get are not sufficient to maintain the minimum standard necessary for health, efficiency, and general well-being.

The telegraph companies' policy of maintaining a high rate of labor turnover, of hiring annually practically three times their normal messenger force, does not increase opportunities for employment; and the record is not persuasive that their proposal to lay off messengers, if it should become a necessity, will curtail opportunities for employment.

It was important to stress the fact, as did the National Child Labor Committee, that the Fair Labor Standards Act did not entirely eliminate child labor. Indeed, estimates put the number of children whose employment would not be affected by the law at 500,000. Said the Committee's annual report for 1938:

These are children working in intrastate industries, chiefly mercantile and personal-service occupations such as stores, garages, repair shops, laundries, hotels, and restaurants, and also many thousands of those employed in agriculture, the report declared. Agricultural child laborers do not include children working at home on chores or other irregular work, but only children "gainfully occupied," according to the census usage of the term.

CHILD PSYCHOLOGY. See **PSYCHOLOGY**.

CHILDREN'S BUREAU. See **CHILD LABOR**.

CHILD WELFARE. The Social Security Act. The Social Security Act, which was passed in 1935, in its third year of operation, was meeting with signal successes, notably in its maternal and child-welfare services. Since the Social Security Act applied to Alaska, the District of Columbia, and Hawaii, as well as to the 48 States, the largest number of plans in operation under any one type of service was 51. In August, 1938, in the three services administered by the Children's Bureau, there were 51 maternal and child-health plans in operation, 50 plans for services for crippled children, and 50 plans for child-welfare services. As a result of the law, Federal grants-in-aid were made to states adopting approved plans for the establishment of maternal and child-welfare services. In the three categories for which the law made provision, Federal funds for the fiscal year 1938-39 were made available as follows: (1) For maternal and child-health services, \$5,227,000; (2) for services for crippled children, \$4,501,000; (3) for child-welfare services, \$2,521,000.

The Social Security Act further provided that the Federal government make matching grants-in-aid for the care of dependent children. For the month of September, 1938, which was typical, the Federal government paid out to states operating approved programs a total of \$8,000,000, which provided for the care of 626,400 dependent children in 253,900 families. This may be compared with the \$6,000,000 expended in the month of Sep-

tember, 1937, which went to provide for the care of 480,561 dependent children in 193,696 families. In September, 1938, average payments came to \$31.72 per family for the month. Average payments ranged from \$10.81 in Arkansas to \$57.49 in Massachusetts. Average payments larger than the average for the country as a whole were made in four New England States, New York, Pennsylvania, the District of Columbia, Maryland, Michigan, Ohio, Wisconsin, Florida, Minnesota, North Dakota, Arizona, California, Oregon, and Hawaii.

Government Programs in Aid of Youth.

The relief and work programs of the U.S. Government gave special consideration to young people. Unemployed young persons were engaged on work programs by the Civilian Conservation Corps and by the National Youth Administration. The NYA provided part-time employment for high school, college, and graduate students so that they could continue their education. Special facilities for the counseling and placement of young persons were also developed by the U.S. Employment Service in co-operation with the NYA. The Federal Committee on Apprentice Training promoted the establishment of apprenticeship standards.

The CCC was established by Congress in March, 1933, and has been extended by successive acts to June, 1940. This is a non-military organization, which has provided employment and vocational training on useful public works in connection with the conservation and development of natural resources. Enrollment was voluntary and was limited to unmarried men from 17 to 23 years of age inclusive, the enrollment being for a term of six months and could be renewed up to two years. Approximately 2,000,000 young men had been enrolled at the end of 1937. Enrollees were required to work 40 hours a week, their basic cash allowance being \$30 per month. At each camp an educational program was established under the direction of an educational advisor appointed by the U.S. Office of Education. As the enrollees were engaged entirely on public conservation projects, they did not compete with workers in private industry.

Under the NYA, part-time employment was provided to students in clerical, library, museum, and laboratory research activities. High school students could earn a maximum of \$6 a month; college undergraduates and graduate students from \$20-\$40 a month. Hours ranged from a maximum of 20 hours per week for high school students to 30 or 40 hours per week for college students. In the academic year 1936-37, \$28,000,000 was spent for student aid and approximately 440,000 students participated in the program.

The NYA also initiated part-time employment projects for out-of-school youth between 18 and 25 years of age who were members of needy families. The hours of work were limited to 8 a day, 40 a week, and 70 a month, and the hourly wage rates of these projects were based on those prevailing in the community.

Birth and Mortality Statistics. The latest figures made available by the Bureau of the Census indicated that in the United States in 1936, 2,144,790 infants were born alive in that year, making a birth rate of 16.7 per 1000. This was lower than that of any other year except 1933 when the birth rate was 16.5 per 1000. Had the 1915 rate of 25.1 per 1000 prevailed in 1936, there would have been more than 1,000,000 additional births during the year.

Provisional statistics for 1937 showed that 2,201,-

609 live births were registered in 1937, making a provisional birth rate of 17.0 per 1000 population. During 1936, the latest year for which final statistics were available, 73,735 stillbirths were registered in the United States, making a rate of 34 per 1000 live births, a rate somewhat lower than that of 1934 and 1935 (36 per 1000 live births). The number of infants who died in 1936 before completing the first year of life was 122,535, making an infant mortality rate of 57 per 1000 live births. The provisional statistics on infant mortality for 1937 showed that 110,760 infant deaths were registered in 1937 and that 2775 fewer infants died in 1937 than in 1936. The provisional rate for 1937, therefore, was 54 per 1000 live births, the lowest on record. In 1936, 12,182 women died from conditions directly due to pregnancy and child health, making a maternal mortality rate of 57 per 10,000 live births. Not only was this the lowest ever recorded in the United States, but it was the seventh consecutive year in which the maternal mortality rate slightly decreased. Nevertheless, the maternal mortality rate of the United States continued exceedingly high as compared with the rates of most foreign countries. Of the 24 countries for which information was available, only 4 had higher maternal mortality rates than the United States. These four were Chile, Lithuania, North Ireland, and Australia. The European countries with the lowest rates were Poland, Norway (28 per 10,000 live births 1935), Netherlands and Italy (30, 1936 provisional rate), Irish Free State (32 in 1937), and Sweden (33 in 1934). The number and percentage distribution of live births, stillbirths, and maternal deaths by age of mother are shown in the accompanying table.

DISTRIBUTION OF LIVE BIRTHS, STILLBIRTHS, AND MATERNAL DEATHS,
BY AGE OF MOTHER; UNITED STATES

The Status of Birth Control. According to Margaret Sanger, the pioneer in the birth-control movement in the United States, writing in the *New Republic* of Apr. 20, 1938, birth control was finally legal in the United States. The right to provide contraceptive information and services under medical direction was recognized under the Federal law as a result of a court decision of the year; and it was also legal under State laws in all but three States—Connecticut, Mississippi, and Massachusetts. The Federal decision arose out of a suit involving the importation of Japanese appliances by Dr. Hannah M. Stone, Medical Director of the Birth Control Clinical Research Bureau in New York. The government, through the Bureau of Customs, had seized the package containing such appliances to prevent conception which the government alleged had been imported contrary to the Tariff Act of 1930. On Nov. 30, 1936, the U.S. Circuit Court of Appeals for the Second Circuit rendered a decision that the Federal obscenity laws did not apply to the legitimate activities of physi-

cians and that physicians might prescribe contraceptives in the interests of the health and general well-being of their patients. The matter was closed when the Attorney-General of the United States announced that the government would rest its case and not carry it to the U.S. Supreme Court. Medical sanction followed legal recognition when in June, 1937, the American Medical Association approved birth control as a necessary part of medical practice and education, urging the necessity for informing physicians of their legal rights in relation to the use of contraceptives.

While from a national standpoint, birth control was finally free, Miss Sanger pointed out that there was need for clarification of State statutes in a few States where the literal wording of the law might still be invoked. There remained still three States in which the legal use of contraceptives was still ambiguous. In one, Connecticut, the use of contraceptives was forbidden. Mississippi made no exceptions in its statutes which banned even oral information. In Massachusetts also no exceptions were made, but the State law was being challenged through the establishment of birth-control clinics and the appeal to the higher courts where interference with clinics took place. Miss Sanger also pointed out that 10 States had limited laws, but physicians were exempt and drugstore sales of contraceptives were permitted. These were Colorado, Indiana, Ohio, Delaware, Iowa, Montana, Wisconsin, Wyoming, Oregon, and Idaho. In the three States of New York, Nevada, and Minnesota, physicians were permitted to prescribe contraceptives but druggists were not mentioned. The six States of Arizona, California, Louisiana, Maine, Michigan, and Washington had statutes aimed at

indiscriminate advertising and distribution of material. The State of New Jersey allowed the dissemination of information for a "just cause."

Juvenile Delinquency. In 1937 there was a reversal in the downward trend to juvenile delinquency coming before the courts that reported to the Children's Bureau. In the area served by 28 courts reporting to the Bureau each year since 1929, the number of delinquency cases in 1937 was 11 per cent greater than in 1936 (30,364 as compared with 27,849). In 1937, of the total delinquency cases disposed of, the boys made up 25,868 and the girls 4496. The table on p. 148 shows the age distribution of boys and girls in the cases dealt with at the 27 courts recording this information.

Legislation. During the year 1937, according to the compilation made by the Children's Bureau in August, 1938, 46 States, Alaska, Hawaii, and Puerto Rico passed laws affecting children and young people. The legislation indicated a decided trend toward greater protection for the adopted child and the child born out of wedlock, when laws

relating to birth records were enacted for 13 States and the District of Columbia, and laws regulating adoptions and change of name were enacted for 7 States and the District of Columbia. In contrast to the liberalization of birth-certificate requirements, the year saw a tightening of requirements for marriage. The minimum marriage age for one or both parties was raised in the District of Columbia, Hawaii, and the States of Florida, Rhode Island, and Tennessee. A waiting period between application for a marriage license and its issuance was required in the District of Columbia and in Illinois, Maryland, Tennessee, and West Virginia. New York required a waiting period between the issuance of the license and the solemnization of marriage. Measures relating to health certificates were enacted in Puerto Rico, Illinois, Michigan, New Hampshire, Oregon, and Wisconsin. Physically and mentally handicapped children were the subject of new legislation in 31 States and in Alaska, Hawaii, and Puerto Rico. Nineteen of these States and Alaska and Puerto Rico made provision for services to crippled children and for co-operation with the Federal government in such services. Laws relating to the care of mentally diseased and defective children were enacted in 22 States and Puerto Rico.

CHILE. A South American republic. Capital, Santiago.

Area and Population. Chile has an area of 286,396 square miles and a population estimated on Aug. 31, 1938, at 4,626,508 (4,287,445 at the 1930 census). Living births registered in 1937 numbered 153,328 (33.5 per 1000); deaths, 109,792 (24 per 1000); marriages, 38,079 (8.3 per 1000). The population is predominantly European (chiefly Spanish) in origin, but there is a considerable Indian strain in the lower classes. Populations of the chief cities at the 1930 census were: Santiago, 696,231; Valparaiso, 193,205; Concepción, 77,589; Antofagasta, 53,591; Viña del Mar, 49,488; Iquique, 46,458; Talca, 45,020; Chillán, 39,511; Temuco, 35,748; Valdivia, 34,296; Talcahuano, 27,594; Magallanes, 24,307.

Education and Religion. The adult population was estimated to be 75 per cent illiterate in 1930. In 1936 there were 4615 public and private elementary schools, with 568,700 pupils; 10 public and private normal schools, with 1597 pupils; 233 secondary schools, with 43,381 pupils; 28 commercial schools, with 4896 pupils. There are also four universities and various lyceums and colleges. Public primary schools in 1938 numbered 345 with a registration of 53,226. Most Chileans belong to the Ro-

man Catholic Church; other faiths enjoy complete religious liberty.

Production. The 1930 census showed 37.8 per cent of the working population engaged in agriculture and 22.1 per cent in industry. According to the President's message of May 21, 1938, 1,747,000 persons were employed on 202,000 farms which had an aggregate area of nearly 70,000,000 acres and a value of 6,667,000,000 pesos. Yields of the chief crops in 1937-38 were (in metric tons): Wheat, 827,200; barley, 163,800; rye, 7700; oats, 123,000; corn, 67,800 (1936-37); potatoes, 445,200 (1936-37); tobacco, 6900 (1936-37). The wine yield in 1935-36 was 3,483,000 hectoliters (hectoliter equals 26.42 U.S. gal.). Wool production in 1936 was estimated at 15,500 metric tons.

The production of nitrate soda in the year ended June 30, 1937, was 1,315,000 metric tons (1,220,000 in 1935-36). Output of other minerals in 1937 was (in metric tons): Copper, 413,200 (metal content of ore); coal, 2,001,000; iron ore, 916,000 (metal content); silver, 55.6. Gold output in 1937 was 9815 kilograms. There were 18,996 industrial establishments in Chile in 1936, the leading manufacturing lines being textiles, footwear, electric power, cement, paper. In 1938 there were 75,556 commercial enterprises. The per capita national income in 1937 was estimated at 1760 pesos (approximately \$70 at the average free market exchange rate).

Foreign Trade. Imports in 1937 were valued at 428,866,000 gold pesos (346,673,000 in 1936) and exports at 947,589,000 gold pesos (562,269,000 in 1936). The value of the chief 1937 exports was: Copper, 504,200,000 pesos; nitrate fertilizers and iodine, 190,400,000 pesos; wool, 43,200,000 pesos; lentils, 20,000,000 pesos; iron ore, 12,600,000 pesos; beans, 12,000,000 pesos. The United States supplied 29.1 per cent of the 1937 imports (25.4 in 1936); Germany, 26 (28.7); Great Britain, 10.9 (13.1); Peru, 8.1 (7.0). Of the 1937 exports, Great Britain took 19.6 per cent (16.4 in 1936); United States, 12.5 (19.5); Germany, 9.5 (9.7).

Finance. Ordinary revenues and expenditures for 1939 were estimated to balance at 1,667,000,000 gold pesos, as compared with actual ordinary revenues of 1,635,000,000 pesos and expenditures of 1,664,000,000 pesos in 1938. Actual revenues for 1937 totaled 1,957,300,000 pesos (ordinary, 1,438,300,000) and total expenditures were 1,846,000,000 pesos (ordinary, 1,478,500,000). The public debt on Dec. 31, 1937, was 5,319,949,000 gold pesos (direct, 4,260,789,000; indirect, 1,059,160,000). Of the direct debt 2,180,853,000 pesos represented the external debt, 1,524,259,000 pesos the internal debt, 321,546,000 pesos banking advances, and 234,131,000 pesos the floating debt. The gold peso (par value, \$0.2060) had the following average exchange rates for 1937: Official, \$0.0516; export draft, \$0.0390; free market, \$0.0379.

Transportation, etc. Chile in 1937 had 5422 miles of railway line (state-owned, 3607; private, 1815). Goods carried on all lines in 1937 aggregated 1,700,000,000 ton-kilometers. Revenues of the state railways were more than 400,000,000 pesos. Nine railways, including one from Antofagasta to Salta, Argentina, were under construction in 1938. During the years 1932-38 a total of 1900 miles of highways were built, 6000 miles of roads were improved, and 357 bridges were constructed. The road system in 1938 included 932 miles of concrete and bitumen, 7456 miles of crushed stone or gravel, 9321 miles of dirt roads, and 7146 miles of trails. The number of automobiles in 1937 was 38,035.

Chile is linked with the international air networks of Pan American Airways, Air France, and the Deutsche Lufthansa. A national air service also connects the principal cities.

Government. By the Constitution of Oct. 18, 1925, executive power is vested in a President, aided by a cabinet responsible to him. Legislation is the function of the National Congress, consisting of a Senate of 45 members elected for 8 years and renewed by halves every 4 years, and a Chamber of Deputies of 146 members elected for 4 years by departments. The President, chosen for 6 years by direct popular vote, is ineligible to succeed himself. President in 1938, Arturo Alessandri, who assumed office Dec. 24, 1932. The cabinet as reorganized May 27, 1937, represented a coalition of Rightist parties (Liberals, Conservatives, and Agrarians).

HISTORY

Presidential Election. The crucial presidential election held Oct. 25, 1938, resulted in the victory of Pedro Aguirre Cerda, candidate of the Popular Front, by a narrow margin over the Rightist candidate, former Finance Minister Gustavo Ross. Aguirre Cerda, a wealthy member of the liberal, bourgeois Radical party, had the support of the Radical Socialists, Socialists, Communists, and National Socialists (Nazis) as well as his own party. The Conservative, Democrat, and Liberal parties and several minor groups, all conservative in complexion, united behind the banner of Señor Ross, a Liberal. The first electoral count showed Aguirre Cerda elected by 220,892 votes to 213,521. The Rightist bloc, however, charged that there was evidence of fraudulent voting and intimidation of their supporters in various districts. They demanded a recount. The final results announced by an electoral commission on December 13 were as follows: Aguirre Cerda, 222,720; Ross, 218,609. On December 14 Congress officially declared Aguirre Cerda elected. He was inducted as President on December 24.

The Political Campaign. The election of the Popular Front candidate marked the triumph of the laboring masses and liberal middle-class elements in their struggle to end the rule of the landholding aristocracy and its conservative allies. During the preceding years President Alessandri had kept the social and class conflict under fair control by his middle-of-the-road policies, shrewd politics, and firm action against extremist tendencies. His success in averting open civil warfare between Rightist and Leftist groups led many moderates early in 1937 to propose revision of the Constitution to permit his continuance in office for another term. On Feb. 24, 1938, the President announced his firm opposition to such a revision of the fundamental law and indicated his determination to withdraw at the expiration of his term after insuring fair and free elections. This promise he fulfilled to the letter.

The political campaign had already gotten under way in 1937 (see 1937 YEAR BOOK, p. 149). With President Alessandri's announcement, it gathered immediate momentum. In the municipal (county) elections of April 3 the Popular Front parties won 1480 seats as against 1355 in 1935, these gains being at the expense of the Rightist parties. On April 17 a convention of the Popular Front parties selected Aguirre Cerda as their candidate after the Socialist leader, Marmaduke Grove, had withdrawn his candidacy, announced in 1937. A few days later Ross formally accepted the nomination offered by the Rightist bloc. A third candidate was

former President Carlos Ibáñez, who had returned to Chile from exile in 1937 and launched a campaign for his return to power on a radical platform. The Nazis were the only political party to rally to his support, but Ibáñez counted strongly upon the support of the army officers. Returning to Chile on June 8 from a six-months' absence in Europe, Ross also espoused a program of social reform and economic development for the benefit of the masses, but advocated decentralization of government and business, lower taxation, and encouragement of the investment of foreign capital in Chile—policies strongly disapproved by the extremist elements within the Popular Front.

The bitterness of the campaign was evidenced in Leftist charges that the state-controlled Nitrate and Iodine Sales Corporation, of which Ross was president, planned to close nitrate plants in the northern provinces in order to force the departure of numerous workers and reduce the Leftist vote. Although this charge was denied, the Popular Front parties continued to attack President Alessandri and to accuse him of working to secure Ross's election. Resenting these attacks, the President refused to receive a Leftist delegation. The Leftists thereupon issued a statement warning the President not to appear before Congress to read his annual message.

Dr. Alessandri ignored this warning and appeared before Congress on May 21 to reopen its ordinary sessions. His message was interrupted by a hostile Leftist demonstration during which Deputy Jorge González von Marées, leader of the Nazi party, drew a pistol and fired a wild shot. At the same time a bomb was exploded in the adjoining garden. The police arrested González von Marées, roughly handled several other Leftist deputies, and dispersed the crowd that had gathered outside. The Nazi leader was later sentenced to a year and a half in prison and fined \$200 for his part in the incident. These developments widened the breach between the government and the Leftists, who accused the Minister of the Interior of unconstitutional action in sanctioning the arrest of González von Marées and the mistreatment of other deputies. This charge was rejected by the Chamber of Deputies, 71 to 63, on June 1.

The Nazi Revolt. The tension produced by these events steadily mounted, particularly after the highest Chilean court late in August upheld the sentence imposed upon González von Marées. Two weeks later, on September 4, the Nazis mobilized between 10,000 and 20,000 persons for a political parade in Santiago in support of General Ibáñez's candidacy. Apparently intoxicated by the success of this demonstration and counting upon military support, a group of armed Nazis, most of them youths of 20 or under, staged a rising against the Alessandri Government the following day. A surprise attack gave them possession of a group of buildings near the Presidential palace. But the expected military help was not forthcoming. The Federal police, a well-trained and disciplined military force, quickly surrounded the revolutionists. After a four-hour siege with light artillery and machine guns, the surviving rebels raised the white flag. Sixty-two persons were killed or mortally wounded in the fighting, most of them Nazis.

Immediately upon the outbreak the government declared a state of siege and began arresting Nazi leaders and others suspected of complicity in the revolt. General Ibáñez was arrested when he entered an infantry regiment headquarters and demanded refuge. On September 8 González von Marées is-

sued a statement assuming full responsibility for the uprising and absolving General Ibáñez of any connection with it. This version of the uprising was confirmed by the Court of Appeals after careful investigation. On October 23, two days before the Presidential election, the Court cleared General Ibáñez, while sentencing González von Marées to 20 years in prison and barring him from holding public office as long as he lived. A sentence of 15 years' imprisonment and perpetual disbarment from office was passed on Oscar Jimenez, the organizer of the revolt. Of eight other Nazis convicted at the same time, three were sentenced to long prison terms and five were deported. In the meantime, General Ibáñez on October 16 had formally withdrawn his candidacy for the Presidency. The imprisoned Nazi leader then instructed his followers to vote for Aguirre Cerda.

The Nazi uprising served to heighten political tension between the Popular Front and Rightist parties, who accused one another of encouraging the revolt. The government's severe measures also came in for Leftist criticism. Over Leftist protests, Congress on September 12 granted the President's request for special powers in dealing with the Nazi conspiracy and for extension to the entire country for four months of the state of siege proclaimed in the capital on the day of the Nazi outbreak. Drastic censorship of the press and radio stations was imposed. As the police investigation of the revolt proceeded, the authorities announced that it had wide ramifications and that the Nazi plans called for the execution of President Alessandri, Gustavo Ross and a number of other prominent political leaders and newspaper editors.

The entire cabinet resigned on September 12, apparently in connection with the Nazi uprising. On September 15 President Alessandri refused to accept the ministers' resignations, asserting that their continued co-operation was needed to maintain public order against another Nazi conspiracy. All but three Conservative members of the cabinet then withdrew their resignations. The Conservative party declared it could no longer participate actively in the government. On October 14 the police arrested a number of retired army and aviation officers charged with conspiring against the government.

Aftermath of the Election. The narrow margin by which the Popular Front candidate was elected and the Rightist claims of fraud and violence increased the danger of civil war. The state of siege, suspended during the election, was reimposed October 30. Leftist leaders announced that the masses would defend their victory by armed force if the Rightists attempted to juggle the election returns so as to disqualify Aguirre Cerda. The action of some leading Rightists in proclaiming their acceptance of the Popular Front victory and Señor Aguirre Cerda's promises to observe the laws and the Constitution served to lessen the political tension during the remaining months of the year. The President-elect promised that his government would be "sincerely democratic and definitely end conditions in which the Chilean masses lack food, culture, clothes and dwellings." At the same time he indicated that he would respect "legitimate established rights," co-operate with foreign capital in the development of Chile, oppose foreign anti-democratic ideologies, and seek to reform rather than abolish existing social institutions. His foreign policy, he said, would include "buying from those who buy from us," withdrawal

from the League of Nations, and support of President Roosevelt's "good neighbor" policy.

While the electoral commission was counting the vote, political tension seemed repeatedly near the breaking point. Both sides were accused of organizing and arming private militias. On November 12 Ross announced that he would drop his demand for a recount in order to avert armed strife, and on November 28 he left Chile, thus accepting his defeat. Upon the confirmation of his election by Congress, Aguirre Cerda announced the following cabinet: Interior, Pedro Alfonso (Radical); Finance, Roberto Wacholts (Radical); Foreign Affairs, Abraham Ortega (Radical); Defense, Alberto Cabero (Radical); Education, Rudecindo Ortega (Radical); Agriculture, Arturo Olavarría (Radical); Justice, Raul Puga (Democrat); Labor, Antonio Poupin (Democrat); Health, Miguel Etchebarne (Socialist); Trade, Arturo Bianchi (Socialist); Lands, Carlos Martínez (Socialist).

The first action of President Aguirre Cerda after his induction was to grant amnesty to González von Marées and the other Nazi leaders imprisoned after the revolt of September 5. Reorganization of the government and military personnel followed. Seven army generals considered Rightist sympathizers retired on December 27 at the suggestion of the new Minister of Defense. There were wholesale resignations of Chilean diplomatic officials holding foreign posts. On December 28 a Communist was appointed mayor of Valparaíso and a Socialist mayor of Viña del Mar. Forty-five decrees signed by President Alessandri on the eve of his retirement were suspended on December 29. As the year ended, the government was considering concrete proposals for carrying out the Popular Front's program.

Other Internal Affairs. Although prices for Chile's major export products declined during the year, progress toward economic recovery and stability continued. Chile's frozen credits with various countries were virtually eliminated through a series of trade compensation and other agreements. The government's offer to resume interest and amortization payments on Chilean dollar bonds on an adjusted basis was accepted by the American Bondholders' Protective Council. A law passed in January gave a stimulus to the mining industry through the provision of low-interest government loans. The government granted an oil concession on October 3 to Pedro Dreyfuss, a French engineer.

Steps taken to strengthen the nation's defenses included the passage of a law providing funds for large army and navy purchases, authorization of a substantial increase in the number of officers and enlisted men in the army and navy, and the completion of plans for the purchase of two 8000-ton cruisers. A strike of 10,000 workers in the mines of the Braden Copper Company paralyzed operations for several weeks in July. It was ended through the intervention of President Alessandri, who appointed a commission to study the question of wage increases.

Foreign Relations. While withdrawing from the League of Nations, Chile during 1938 developed an active policy of closer political and economic relations with the neighboring states and the other American nations. Chile's resignation from the League was announced May 14 after the Geneva organization had ignored the Chilean demand that the Covenant be revised to make the League "a non-coercive political body" and to secure the membership of all the states outside of the League.

The collapse of the League of Nations, the Span-

ish civil war, the aggressive policies of Italy and Germany, and the flight of political refugees from Austria, Czechoslovakia, and other European countries to Latin America spurred the Alessandri Government to join with other American nations in removing mutual misunderstandings and promoting a policy of practical Pan Americanism. In his message to Congress May 21 President Alessandri warned that Chile would not tolerate foreign political activities on her soil.

The new Argentine Foreign Minister visited Santiago early in May and reached an agreement for arbitration of the Beagle Channel Islands dispute, the establishment of a permanent mixed Chilean-Argentine commission charged with the prevention of controversies between the two countries, and the development of cultural ties. This visit was returned later the same month by a Chilean delegation under Foreign Minister José Ramon Gutiérrez, which also spent four days in the capital of Brazil cultivating closer relations and returning a goodwill visit to Chile in March by a Brazilian military mission.

New commercial and cultural agreements were signed with Argentina on February 18, with the United States on January 6, and with Bolivia on May 21. The latter treaty, embodying some of the recommendations made in 1937 by a mixed Bolivian-Chilean commission, provided for reciprocal most-favored-nation treatment of one another's nationals and commerce. It also established a permanent mixed commission to promote trade between the two countries.

The Chilean-Peruvian mixed commission after extended negotiations submitted recommendations on September 28 for a new commercial treaty and for closer political, economic, and cultural relations. One result of the closer Chilean co-operation with neighboring states was the settlement of the Bolivian-Paraguayan dispute at the Chaco Peace Conference in Buenos Aires (see CHACO DISPUTE, SETTLEMENT OF). Also see ARGENTINA and BOLIVIA under *History*; PAN AMERICAN CONFERENCE.

CHINA. A republic of eastern Asia. Capital, Chungking. Nanking, the former capital, was captured by the Japanese in December, 1937, and Hankow, to which most of the Chinese Ministries were then transferred, fell in October, 1938.

Area and Population. Including the nominal dependencies of Sinkiang (Chinese Turkestan), Outer Mongolia (see MONGOLIA), and Tibet (q.v.), over which the Central Government exercised little or no actual control, and the former Chinese Provinces incorporated in the Japanese protectorate of Manchoukuo (q.v.), China has an area estimated by the Ministry of the Interior in 1937 at 4,516,934 square miles and a total population of 466,785,856. Official 1937 estimates of the area and population by Provinces are shown in the table in next column.

As no census has been taken in modern times, the above figures are merely rough estimates. Including the nominal dependencies, the area is roughly equal to that of the United States and Mexico combined, while the population is approximately one-fourth of the world's total. In addition there were estimated to be 7,828,888 Chinese residing abroad in 1936. The estimated population of Shanghai and its environs in 1936 was 3,489,998 including 1,450,685 persons in the Foreign Settlements; of Peiping, capital of China until 1928, 1,556,364; of Tientsin, 1,292,025; of Nanking, 1,019,948; of Tsingtao, 514,769. Estimated popula-

AREA AND POPULATION OF CHINA

Province (Capital *)	Sq. miles	Population
Anhui (Anking)	51,902	23,265,368
Chahar ^b (Wanchuan, Kalgan, Chang-chiaw)	107,705	2,035,957

Yunnan (Kunming, Yunnanfu)	123,572	11,994,549

* Where more than one name is given for the respective capitals in parentheses, they represent the official name, postal map name, and popular or ancient name, in the order given. ^b Chahar, Ningsia, and Suiyuan Provinces, together with part of Jehol, form the geographical region known as Inner Mongolia. ^c The Provinces of Heilungkiang, Kirin, and Liaoning constitute the geographical region known as Manchuria, which on Feb. 18, 1932, was proclaimed the free state of Manchoukuo. Jehol Province was incorporated in Manchoukuo in 1933. ^d Dependencies. ^e The Mongol name for Urga has been changed to Ulan Bator Khoto.

tions of the other chief cities in 1931 were: Canton, 861,024; Hankow (including Wuchang and Han-yang), 777,993; Chungking, 635,000; Wenchow, 631,276; Changsha, 606,972; Hangchow, 506,930; Weihaiwai, 390,337; Foochow, 322,725; Soochow, 260,000; Amoy, 234,159; Ningpo, 218,774; Wansien, 201,937; Chinkiang, 199,776.

Education and Religion. Between 25 and 50 per cent of the population were estimated to be literate in 1937, compared with an estimated 15 per cent in 1912. In 1933-34 there were 258,934 elementary schools, with about 12,324,000 pupils; and 3125 secondary schools, with about 560,000 students. In 1936 the number of public and private universities, colleges, and advanced technical schools was 108.

With the exception of Christians and Mohammedans, most Chinese practise and profess all three indigenous or adopted religions—Confucianism, Buddhism, and Taoism. The Mohammedans are estimated at about 20,000,000. In 1934 there were 2,623,560 native Roman Catholics and 123 Catholic missions, with a staff of 16,241. In 1932 there were 1130 Protestant mission stations, a staff of 6150, and 488,539 communicants.

Production. About 74 per cent of the total population (some 60,000,000 families) live on farms. There were estimated to be 607,000,000 acres of arable land, of which about 228,000,000 acres were under cultivation (145,000,000 acres devoted to foodstuffs) in 1936. The farm plots average about four acres. In 1936 about 46 per cent of the farmers owned their own land, 25 per cent were part owners, and 29 per cent were tenants. Previous to the outbreak of the Chino-Japanese War in 1937,

China was the world's leading producer of rice, soybeans, tea, kaoliang, sweet potatoes, millet, and vegetable oils; it ranked second in the output of raw silk and wheat; third in cotton; and was an important producer of corn, tobacco, fruits and vegetables, and cane sugar, as well as the leading exporter of eggs and tung oil. Estimated production of the chief crops in 1937 was (in metric tons): Wheat, 17,320,000; barley, 6,371,000; oats, 852,500; corn, 6,130,100 in 1936; rice, 48,014,900 in 1936; tobacco, 633,700 in 1936; cotton-seed, 1,630,000; linseed (exports), 12,200; rape-seed, 2,478,600 in 1936; sesamun, 865,000 in 1936; ground-nuts, 2,631,100 in 1936; soybeans, 5,911,000 in 1936; cotton, 700,000; raw silk (exports), 5500.

China is normally one of the world's leading producers of antimony, tin, tungsten, and manganese. It produces substantial quantities of coal, oil, fluorite, mercury, galena, gold, silver, and many other metals. For 1936 production, see 1937 YEAR BOOK. Estimated output of tungsten (metal content of ore) in 1937 was 9910 metric tons; tin, 11,300 metric tons. China's rapidly growing industries (see 1937 YEAR BOOK, p. 152) suffered a severe setback as a result of the devastation of Shanghai, Nanking, Hankow, Canton, and other great cities during the warfare of 1937 and 1938 (see *History*).

Foreign Trade. Excluding the trade of Manchuria, the foreign (non-Chinese) trade of Hong Kong, and all other trade not controlled by the maritime customs, general imports in 1937 were valued at 956,234,000 yuan (\$167,312,000 in old U.S. gold dollars) and exports of Chinese products totaled 838,770,000 yuan (\$146,760,000). In U.S. currency dollars, the 1937 net imports totaled \$276,100,000; net exports of Chinese products, \$248,174,000. The leading import items were heavy iron and steel, machinery, chemicals and allied products, kerosene, and rice. The chief exports were tung oil, \$26,600,000 (currency dollars); raw silk, \$13,392,000; tungsten, \$12,067,000; tin ingots and slabs, \$11,759,000. The United States supplied 19.8 per cent of the 1937 general imports; Germany, 15.3; Japan, 15.7; United Kingdom, 11.7. Of the exports of Chinese products, the United States took 27.6 per cent; Hong Kong, 19.4; Japan, 10.1; United Kingdom, 9.6; and Germany, 8.6.

Recorded merchandise imports into China during 1938 totaled 385,600,000 customs gold units (customs gold unit equaled \$0.6655 in 1937), a decrease of 8 per cent from 1937. Recorded merchandise exports were valued at 762,600,000 yuan, a 9 per cent decrease from 1937. Japan furnished 28.76 per cent of the recorded imports (18.12 in 1936, the last normal year); United States (including Philippines), 17.32 per cent (20.07 in 1936). Of the recorded 1938 exports, the Japanese Empire took 21.71 per cent (19 per cent in 1936); the United States and Philippines combined, 19.6 per cent (30 per cent in 1936). United States trade figures for 1938 showed exports to China (not including Hong Kong) of \$34,772,436 (\$49,702,780 in 1937) and imports from China of \$47,160,079 (\$103,621,914).

Finance. The budget of the Chinese Central Government was put on a calendar year basis as of Jan. 1, 1938. The budget for the fiscal year 1937-38 (balancing receipts and expenditures at 1,000,649,000 yuan) was extended through the last six months of 1938 with required revisions. No figures as to actual budgetary operations since the outbreak of the Chino-Japanese war in 1937 were available. The British Inspector General of Chinese maritime customs reported that collections for 1938 were 254,570,000 yuan (342,900,000 in 1937). About

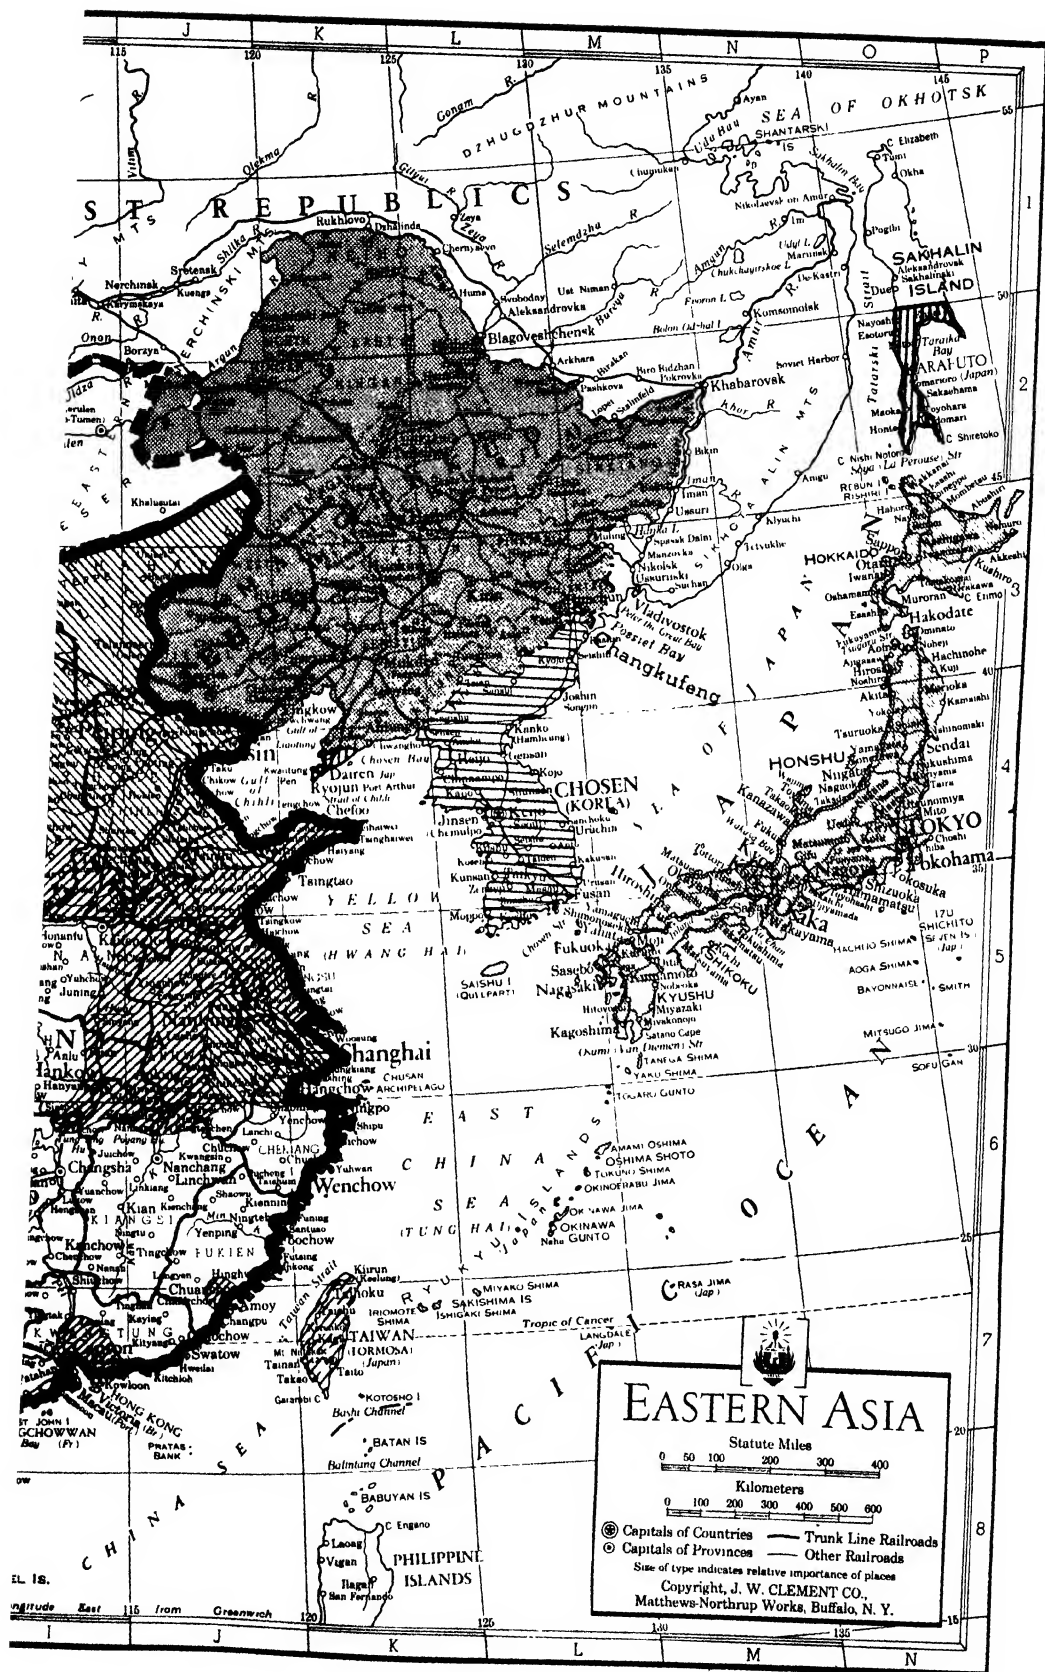

38 per cent of the 1938 receipts were collected in ports still under the control of Chinese authorities, but the Central Government received only about 97,000,000 yuan out of the total collections. With the exception of 1,180,000 yuan remitted by the Shanghai customs in June, 1938, none of the customs revenues collected in Japanese-controlled areas was made available to the Chinese Central Government for either domestic or foreign loan service or for administrative expenses. Nevertheless, the Central Government reported that it met all payments due in 1938 on domestic and foreign loan obligations secured on the customs, the payments being distributed as follows: Anglo-German loan of 1898, Boxer indemnities, and Reorganization loan of 1913, 78,000,000 yuan; United States wheat, flour, and cotton loan, 10,000,000 yuan; domestic loans, 129,100,000 yuan; total, 217,200,000 yuan. The yuan exchanged at an average of \$0.2961 in 1937 and \$0.2136 in 1938.

Transportation. The advances made by Japanese forces during 1937 and 1938 placed most of the Chinese railway system under their control. The Japanese proceeded to extend this system in North China. Completion of the Chengteh-Kupeikow railway early in 1938 provided a second route from Manchuria to Peiping, via the capital of Jehol Province. Work was also under way on a strategic railway from Chengteh to Dolon Nor on the Chahar border. Outlets for the Chinese-controlled areas and the development of transportation lines within these areas are described under *History*. The Chinese Ministry of Communications announced that between the outbreak of the Chino-Japanese war and early August, 1938, 14 trunk highways in the interior had been opened to traffic. Their total length was about 8700 miles. The total road mileage of China in 1937 was estimated at 61,430 miles; number of automobiles, 42,861.

The existing routes of the three commercial air companies operating in China were disrupted by Chino-Japanese hostilities. A number of Japanese-controlled air services were opened connecting the newly conquered cities of China with Japan and Manchuria. The Sino-American and Sino-German companies opened many new routes in the interior to replace those abandoned to the Japanese. The Chinese merchant marine in 1938 comprised 249 vessels (of 100 tons or over) with a gross tonnage of 473,086. During 1937, 35,925 vessels of 17,765,000 net registered tons entered Chinese ports in the foreign trade, while 60,124 of 27,315,000 net registered tons entered in the coastal trade.

Government. The Nationalist Government at the beginning of 1938 represented a Kuomintang (National party) dictatorship. The Organic Law of Oct. 4, 1928, revised on Dec. 29, 1931, and Dec. 27, 1932, vested supreme power in the National Congress of the Kuomintang, acting through the Central Executive Committee, the Central Supervisory Committee, and the Central Political Council. Executive control, however, rested mainly in the hands of Gen. Chiang Kai-shek, commander-in-chief of the Nationalist armies. Pending the projected establishment of representative government, governmental functions were carried on by means of a committee system (for description, see 1932 YEAR BOOK). The chairman of the State Council and nominal head of the government at the beginning of 1938 was Lin Sen. The chairmen of the five yuan (committees) of the government were: Executive, Dr. H. H. Kung; Legislative, Sun Fo; Judicial, Chu Cheng; Examination, Tai Chi-tao; Control, Yu Yu-jen. Assisting Dr. Kung

in the executive branch were nine ministries, headed as follows after the cabinet reorganization of Jan. 2, 1938: Interior, Gen. Ho Chien; Foreign Affairs, Dr. Wang Chung-hui; Military Affairs, Gen. Ho Ying-chin; Finance, Dr. Kung; National Economy, Dr. Oong Wen-hao; Railways and Communications, Dr. Chang Chia-ngau; Education, Chen Li-fu. The Ministry of Judicial Administration, headed by Wang Yung-ping, was subordinate to the Judicial Yuan. For developments in 1938, see *History*.

HISTORY

Progress of War. The sanguinary Chino-Japanese war that broke out in July, 1937, continued with unabated fury throughout 1938. Despite stubborn Chinese resistance, Japan's armies registered further sensational gains, indicated on the accompanying map. They closed the great gap separating their forces in the Yangtze Valley and in North China, the campaign culminating in the fall of Suchow on May 19. They then turned their mechanized armies against Hankow, provisional capital of Nationalist China after the capture of Nanking on Dec. 12, 1937. Hankow was occupied on October 25, after a strenuous and costly drive up the Yangtze. Meanwhile another Japanese force landed near British-owned Hong Kong and easily captured Canton, the metropolis of South China, on October 21.

The end of 1938 found the invaders in possession of nine-tenths of the far-flung Chinese railway system, practically all of the principal ports on the China coast, and most of the great cities of the interior. Nearly one-fourth of China, with 270,000,000 inhabitants, was under their nominal control. The Chinese armies were completely cut off from contact with the outside world except for a newly completed motor highway from Kunming, Yunnan Province, to the Burma frontier, a caravan route passable to motor trucks from Sian across Sinkiang to the Soviet frontier, and the narrow-gauge railway connecting Yunnan with the ports of French Indo-China. The richest lands of China were devastated or ruled by the Japanese. China had been deprived of many of her mines, of her key industries and industrial centers. Far more than a million Chinese soldiers and civilians were estimated to have been slaughtered and at least 30,000,000 had been rendered destitute and homeless. Great floods and war-made famines added to the havoc wrought by contending armies. The "scorched earth" policy of the Chinese left ruined cities and countryside for the Japanese to occupy. Japanese looters extended the work of devastation, while Japanese narcotic peddlers working under the alleged protection of the army spread drug addiction among thousands of hope-bereft Chinese (see *NARCOTICS*).

The Chinese armies were repeatedly defeated with heavy losses and the cities remaining in their control were frequently bombed by the Japanese air force. Yet at the end of 1938 about 1,500,000 armed soldiers remained in Chiang Kai-shek's armies, stubbornly opposing further Japanese advances and even recapturing some of their lost territories. In addition, some 1,250,000 guerrillas were active behind the Japanese lines. They frequently interrupted railway and highway communications, captured supply trains, annihilated small Japanese detachments, and exercised full control over large areas of countryside, sometimes up to the very walls of Peiping, Shanghai, and other Japanese-held cities. Defeatist sentiment that appeared among

some Chinese officials after the loss of Hankow and Canton was ruthlessly suppressed by Gen. Chiang Kai-shek and his adherents. Toward the end of the year China's will to resist was strengthened by American and British credits and increased military aid from the Soviet Union.

Meanwhile Japan was feeling more and more acutely the financial and economic strain of a war costing her about \$5,000,000 daily. Uneasiness was increasing at home, while the Japanese troops in China had come to regard the conflict as anything but a picnic. Some neutral estimates placed the number of Japanese soldiers killed and wounded in battle or incapacitated by disease in the year and a half of fighting as high as 500,000. Of nearly 800,000 Japanese troops under arms in China at the year end, few felt certain that they would ever return to Japan. They were widely scattered over a "front line" more than 2100 miles long and over thousands of miles of communications. Unable to inflict a decisive defeat upon the enemy, and harassed day and night by Chinese guerrillas, the lot of the Japanese soldier was anything but pleasant. Yet the militarists now in full control of Japanese foreign and domestic policy were determined to continue the war until China was beaten to her knees and Gen. Chiang Kai-shek and his Nationalist Government destroyed.

The Suchow Campaign. Soon after the fall of Nanking in December, 1937, the Japanese launched their campaign to unite their forces in North and Central China. From Pukow, on the opposite bank of the Yangtze from Nanking, the troops under Gen. Iwane Matsui drove northward along the Tientsin-Pukow railway. At the same time Count Juichi Terauchi, Japanese commander in North China, sent his armies southward along the same railway from Tsinan in Shantung Province to meet General Matsui's forces. Before this threat, Gen. Han Fu-chu, the Governor of Shantung, abandoned the port of Tsingtao after destroying all Japanese industrial properties. A Japanese naval force occupied Tsingtao on January 10. Meeting scarcely any resistance, small Japanese forces were able to occupy the Tsingtao-Tsinan branch railway and most of Shantung. For this precipitate retreat, which nearly upset Gen. Chiang Kai-shek's plans for the defense of Suchow, Han Fu-chu was subsequently executed.

Suchow is the junction point of the Tientsin-Pukow railway with the strategically important Lung-Hai railway connecting Haichow on the Yellow Sea with Chengchow on the Peiping-Hankow line and Sian, capital of Shensi Province. The Chinese rushed their best troops to the defense of Suchow and by the middle of February were able to halt General Matsui's northward advance at the Hwai River, while Terauchi's forces on the Tientsin-Pukow line were stopped in the vicinity of Tsining and Yenchow. While the Japanese forces on the Tientsin-Pukow railway recruited their strength, Terauchi mobilized other troops in North China for two additional offensives designed to cross the Yellow River and cut the Lung-Hai railway west of Suchow. One of these drove southward along the Peiping-Hankow railway, the other southwestward through Shansi Province.

Both of these columns made considerable progress during late February and early March, but before they could reach the Yellow River both offensives were abandoned. Leaving skeleton forces in control of newly conquered territory, the Japanese rushed the bulk of the troops on the Peiping-Hankow railway and in southern Shansi to the

Suchow front, where their northern army had suffered severe reverses early in April.

Chinese victory at Taierhchwang. Terauchi's troops based on Tsining and Yenchow had resumed their southward drive on March 14. Advancing 50 miles, they captured Hanchwang, where the Tientsin-Pukow railway crosses the Grand Canal, on March 21. Suchow was only 20 miles away, but stubborn Chinese resistance blocked the crossing of the Grand Canal. The Japanese then launched a flanking movement along the branch railway line to the walled town of Taierhchwang, some 20 miles southeast of Hanchwang on the Grand Canal. The advance units of Terauchi's troops fought their way into Taierhchwang on March 31. There they were hemmed in by superior Chinese forces while guerrillas harried their supply lines. After a week of bloody fighting the Japanese were driven out of Taierhchwang on the night of April 6-7. Several thousand were trapped and annihilated, while the survivors retreated to join the main column at Yih sien. It was the most severe defeat inflicted upon Japanese troops in modern times. The Japanese force at Yih sien defended itself with difficulty against strong Chinese attacks until a relief column from Tsingtao arrived on April 23.

Strengthened by constantly arriving reinforcements, the Japanese sought to flank the Chinese to the east of Taierhchwang by a drive toward the junction of the Lung-Hai railway and the Grand Canal at Yunho. This move was likewise halted by the Chinese short of its objective after days of heavy fighting along the entire line from Taierhchwang to Matowchen and Tancheng. By May 6 the battle had developed into a stalemate, which the Japanese broke by a new flanking movement launched from Tsining against the Lung-Hai railway west of Suchow. At the same time, the Japanese forces that had advanced from the Yangtze to the Hwai River along the Tientsin-Pukow railway resumed their advance with augmented forces and a new commander. Driving rapidly northward, they planned to meet the Japanese northern armies on the Lung-Hai line west of Suchow and thus cut off the westward retreat of some 750,000 Chinese troops in the Suchow area.

Fall of Suchow. This pincer movement forced Chiang Kai-shek to abandon Suchow and to withdraw his forces hastily westward along the Lung-Hai railway. The Chinese suffered heavy casualties from the hot pursuit of Japanese mechanized columns and constant air attacks, but managed to escape with the bulk of their forces. Suchow was occupied by the Japanese on May 20, thus bringing the entire Tientsin-Pukow railway under their control. The victory-flushed Japanese columns continued to drive the Chinese rapidly westward across the open plains of Honan and northern Anhwei. Kweiteh, Lanfeng, and Kaifeng were captured in rapid succession and Chengchow, which offered an excellent base for an offensive along the railway line southward to Hankow, appeared doomed.

The Yellow River Flood. At this crucial point, the Yellow River, swollen with spring floods, broke through its dikes on June 7 and flooded the country in the path of the advancing Japanese. They charged that the dikes were dynamited by the Chinese troops. The Chinese denied this. At any rate the flood was the equivalent of a major victory for the hard-pressed Chinese. At least 6000 Japanese troops, as well as thousands of Chinese civilians, were drowned or lost in the swirling waters, which swept southeastward across the

broad plains of northern Honan. Several days of heavy rain added to the invaders' difficulties. By June 15 the Japanese columns had become hopelessly mired. They were obliged to retire to Kaifeng, abandoning scores of trucks, artillery pieces, and other equipment. As no further advance was possible until the flood waters began to subside in September, the offensive along the Lung-Hai railway was abandoned. Most of the troops in that and other North China sectors were transferred to the Yangtze Valley to participate in the up-river campaign against Hankow. During the months required to achieve this objective, the Japanese forces in North China remained largely on the defensive, guarding the occupied cities and railway zones against incessant guerrilla attacks.

The Hankow Offensive. A small Japanese force began the advance up the Yangtze from Wuhu in the middle of May while the fate of Suchow was being decided. They advanced 70 miles along the north bank as far as Hefei before being checked. After Suchow's capture, the Yangtze column was strongly reinforced. On June 12 the combined land and naval force captured Anking, capital of Anhwei Province, almost without resistance. The next obstacle encountered was the barrier of sunken barges and stone-filled junks blocking the river at Matang, 40 miles above Anking. Japanese troops were landed below the boom on June 24. The Chinese defenders withstood the Japanese land, air, and naval attack for 11 days before a passageway was cleared through the barrier on July 5.

While fighting continued at Matang, Japanese naval vessels and transports proceeded 25 miles upstream and on July 10 captured Hukow, dominating the waterway through which Poyang Lake empties into the Yangtze, 150 miles by river from Hankow. It took the Japanese two weeks to clear the Chinese from strongly held positions in the hills around the entrance to Lake Poyang. Then the Japanese flotilla moved up the Yangtze 25 miles to Kiukiang, which was captured without resistance on July 26. Up to this point, the Japanese had made notable progress in the face of difficult terrain, searing heat, the ravages of disease, and unusual activity by the Chinese air force, which reported the sinking of a number of Japanese war vessels and transports.

The Advance from Kiukiang. Above Kiukiang, however, the Chinese resistance stiffened, while geographic and climatic obstacles increased. Another strongly defended barrier across the river at Wusueh-Matowchen defied the attack of Japanese land, naval, and air forces for more than two months. The Japanese again resorted to flanking tactics to pass this obstacle. A column was dispatched from Kiukiang southward against Nanchang, site of an important Chinese air base and capital of Kiangsi Province. This drive along the Kiukiang-Nanchang railway met stubborn resistance and failed to attain its objective. Another force landed on the west shore of Poyang Lake with orders to cut the Kiukiang-Nanchang railway, but became stalled in the marshlands surrounding the lake. A stronger column pushed straight west from Kiukiang in an effort to cut the Canton-Hankow railway 70 miles southwest of Hankow. After heavy fighting it captured Juichang, 20 miles west of Kiukiang, on August 24. Its further advance was slow and hard-fought. By the end of September it was still 40 miles away from the railway. Other units struck northward from Juichang against the Chinese troops defend-

ing the southern end of the Wusueh-Matowchen boom. Their progress was equally slow.

Meanwhile two Japanese columns were advancing north of the Yangtze. One, following the river bank, attempted to outflank the Wusueh-Matowchen boom. After weeks of sanguinary fighting, it aided the Japanese naval and air forces in blasting a passageway through the barrier. But even then progress up the river was achieved only by hard fighting for every mile. The first week of October found these units still 80 miles from Hankow. Farther north, however, another column was making better progress. This expedition moved westward from Hopen through Anhwei and along the watershed between the Yangtze and Hwai Rivers toward the Peiping-Hankow line, which it finally reached at a point 88 miles north of Hankow on October 8.

Capture of Hankow. Even after the cutting of the Peiping-Hankow railway, the Chinese armies blocked further progress north of the Yangtze until the Japanese forces of the Yangtze had advanced far enough to outflank Yangsin, the key to the Chinese defenses south of the river. On October 17, Yangsin was abandoned and the Chinese right flank commenced a general retreat, which forced the defenders of the north bank to follow suit. About the same time the Japanese in South China succeeded in severing the railway by which munitions from Hong Kong were being forwarded through Canton to Hankow, thus making further defense of the latter city unfeasible.

The various Japanese columns now advanced rapidly on the heels of the retreating Chinese. On October 25 they entered Hankow, and the neighboring cities of Hanyang and Wuchang, which together formed China's chief industrial center. Before abandoning the cities, the Chinese, pursuing their "scorched earth" policy, had burned huge sections and dynamited millions of dollars' worth of industrial plants, public buildings, and other installations that might prove useful to the Japanese. Of the 1,500,000 inhabitants of the three Wuhan cities, only 400,000 refugees remained when the Japanese entered. Again the Japanese had failed to trap the Chinese armies. One million first-line soldiers remained in the field to the west and south of Hankow, while 2,000,000 more were being trained. The Chinese Government established a new provisional capital at Chungking, 750 miles from the mouth of the Yangtze.

The War in South China. Throughout the first year of the China war the Japanese sought unsuccessfully by diplomatic pressure on Great Britain to check the steady flow of munitions reaching Chiang Kai-shek's armies through Hong Kong and the Kowloon-Canton-Hankow railway. They hesitated to attack Canton, partly for fear that Britain might be provoked into siding openly with China. But this fear was gradually dissipated. During May 10-13, 1938, Japanese troops landed from a fleet of transports under the protection of 12 warships and after some fighting took possession of the Chinese port of Amoy, 300 miles northeast of Canton. Immediately afterward, small Japanese naval expeditions attempted landings at various other points along the coasts of Fukien and Kwangtung Provinces, possibly to sound out British policy in South China.

Isolated air attacks had been made upon Canton from Japanese naval vessels and occupied islands off the Kwangtung coast. But two weeks after the seizure of Amoy, a more serious effort to interrupt the flow of munitions through Canton was

launched. Commencing May 28, squadrons of Japanese bombers, based chiefly at Amoy, rained heavy explosives upon the city daily for nearly three weeks and frequently thereafter. While undoubtedly the main objectives of these attacks were the railway line and the fortifications guarding Canton, the bombs created havoc among the city's million inhabitants. It was estimated that 8000 civilians were killed and wounded and that half of the city's population fled to the hinterland and neighboring Hong Kong to escape the air raids. Large areas of the city were shattered by bombs and gutted by the accompanying fires.

This ruthless bombardment of civilians aroused a storm of denunciation abroad and formal protests from the United States and British governments. It served to impede but not to terminate the flow of munitions through Hong Kong and Canton. Another Japanese air base was established on Namoa Island, off the port of Swatow in eastern Kwangtung, which a Japanese landing party occupied on June 21. Swatow was repeatedly bombed but no attempt was made to occupy it. On July 17 Chinese guerrillas forced the Japanese to withdraw from Namoa. The Japanese on June 20 also threatened to occupy the strategically important island of Hainan, dominating the Gulf of Tonkin.

The Fall of Canton. Great Britain's capitulation to Germany at Munich on September 29 convinced the Japanese Government that it was safe to proceed with an expedition against Canton, secret preparations for which had been underway during the summer. On October 12 Japanese transports escorted by warships unexpectedly landed a mechanized army of some 30,000 fresh troops on Bias Bay, a few miles northeast of the British territory on the mainland opposite Hong Kong. The Chinese, confident that Japan would not run the risk of antagonizing Britain, had withdrawn their best troops from the Canton region to aid in the defense of Hankow. Consequently the Japanese at Bias Bay met little effective opposition. One detachment quickly cut the Canton-Kowloon railway. The main motorized force moved rapidly northward to Waichow, which was occupied October 15, and then circled to the northwest and entered Canton from the north on October 21, after dispersing the numerically superior Chinese defense forces with heavy artillery and gas attacks.

Before abandoning the metropolis, the Chinese dynamited the \$8,000,000 bridge across the Pearl River and many public buildings. This supplemented the work of destruction wrought by Japanese bombers and the invaders found themselves in possession of a ruined city, in which only about 50,000 out of a million inhabitants remained. During the remainder of the year the Japanese extended their control over the delta area around Canton for a distance of 30 or 40 miles. But even with reinforcements their efforts to advance northward along the Canton-Hankow railway and westward toward Wuchow on the Kwangsi border met with reverses. Guerrilla forces were active within the Japanese lines. The year end found the opposing forces in the Canton area in a stalemate, with 120,000 Japanese preparing for drives westward into Yunnan Province and northward along the Canton-Hankow railway. Meanwhile, the Chinese had repulsed a Japanese landing party that attempted to capture Pakhoi on the Gulf of Tonkin, terminus of the railway line from Nanning.

The Central China Front. With the fall of Hankow and Canton, the major objective of Japanese strategy was to establish control over the

entire Canton-Hankow railway. As noted above, the Japanese advanced along the railway from Canton only about 35 miles before being checked. On the northern end of the line, however, the Japanese made more progress. Pressing hard on the Chinese troops retreating from Hankow, they advanced 120 miles farther up the Yangtze to Yochow by November 11. From Yochow the railway leaves the river and strikes southward for 80 miles to Changsha, capital of Hunan Province. When the Japanese troops started from Yochow toward Changsha, panic seized the latter city and on November 14 the local authorities set fire to it in anticipation of its early capture by the invaders. The fires, raging for five days, almost completely destroyed the city of over 600,000 population. It was reported that some 2000 residents were trapped and burned to death in the flames. Meanwhile the Chinese troops had launched a counter-offensive which halted the Japanese advance 40 miles north of the ruined city in the middle of November and drove the invaders back to the outskirts of Yochow by the end of December.

Farther east, the Japanese advance along the railway from Kiukiang to Nanchang made slow progress. From July 26, when Kiukiang was captured, to the end of December, the invaders gained only 50 miles. They were still some 30 miles from Nanchang when the year ended. Japanese casualties in this drive alone were estimated by the Chinese at 30,000. Another active front south of the Yangtze was in the vicinity of Hangchow, southwest of Shanghai, which was captured late in 1937. From there the Japanese in January attempted to advance southward against Ningpo, but were repulsed by Chinese forces. Large Chinese guerrilla forces remained active in the Hangchow district throughout the year despite Japanese efforts to disperse them.

To the north of the Yangtze, the Japanese succeeded with some difficulty in clearing Chinese forces from the immediate vicinity of the Hankow-Peiping railway line, although service on the railway was frequently interrupted by guerrilla raids. Japanese forces, after the fall of Hankow, also advanced westward in an offensive against Shasi and Ichang. They took Tsao-shuh, some 100 miles west of Hankow, but the recapture of this town by the Chinese in the first part of December was reported to have stalled the Japanese drive.

Fighting in North China. The northwestern front had remained largely inactive, except for guerrilla warfare, during the Suchow and Hankow campaigns. The withdrawal of Japanese forces to serve on the latter fronts enabled the well-organized Chinese Communist armies and other guerrilla forces to regain much territory in Shansi and neighboring provinces occupied by the Japanese in 1937 and early in 1938. After the fall of Hankow, however, the Japanese prepared for another drive against Sian, capital of Shensi Province, where the Lung-Hai railway meets the new motor road to Urumchi and the distant Soviet frontier. The drive aimed to cut off military supplies reaching the Chinese armies in northwestern and central China.

Early in December, Chinese Communist sources reported that they had stifled a Japanese advance from Wutai in northern Shansi and killed 6000 of the invaders. Late in the month five Japanese columns started another offensive in southwestern Shansi to reoccupy previously conquered territory, take the strategically important crossing of the Yellow River at its north Fen tributary, and drive

Gen. Yen Hsi-shan, the Chinese commander, from his headquarters at Taning. This drive was weakened by the withdrawal of large numbers of Japanese troops in December from North China to Manchoukuo, reportedly to check disturbances caused by the entrance of the Chinese Communist Eighth-Route Army into Manchuria.

Bombing Activities. From their new bases deep in the heart of China, the Japanese during November and December carried out repeated air raids on virtually all of the larger cities still in Chinese hands. Chengtu, capital of Szechwan; Sian; Lanchow, the capital of Kansu; Shasi and Ichang on the Upper Yangtze; Kweilin in northern Kwangsi, and various other cities experienced, in most cases for the first time, the terrors of heavy air bombardments. These raids bore out the statement of the Japanese embassy at Shanghai on November 4 that "there is now no section of China over which Japanese planes cannot operate."

Chinese Politics. The continuance of Chinese resistance to Japan was dependent to a considerable degree upon maintenance of the anti-Japanese united front of the Kuomintang, the Chinese Communists, and other political groups established in 1937 (see 1937 YEAR BOOK). On Jan. 3, 1938, a reorganization of the Nationalist Government at Hankow took place, with Dr. H. H. Kung replacing Gen. Chiang Kai-shek as President of the Executive Yuan (Premier) to permit the latter to devote himself exclusively to his military task (see *Government*). At the same time steps were taken to reorganize national defense and strengthen the united front. It was reported that Communists and other radicals in government reformatories for political offenders were released. Mao Tse-tung and other Communist leaders were granted a voice in the determination of military and civil policies.

The Kuomintang Party Congress held in Hankow, March 29 to April 2, with 400 representatives from all parts of China in attendance, took notable steps toward establishment of a democratic political system. The Congress reaffirmed Sun Yat-sen's principles of nationalism, democracy, and popular welfare as the basic precepts of the political system. It created a People's Political Council, composed of representatives of all political groups, to serve pending the establishment of a full-fledged legislature. A decree was issued granting full freedom of speech, press, and assembly so long as it did not hamper prosecution of the war against Japan. While the Kuomintang dictatorship was thus substantially modified, the party retained its dominant position. A Kuomintang Youth Corps was established to train future party members. Gen. Chiang Kai-shek was made Leader or President (Tsung Tsai) of the party, with the position of permanent chairman of the Central Executive Committee and with powers of "conditional veto" over the latter's actions. Detailed plans were also drawn up for the building up of war industries in Western China and for reconstruction of devastated areas.

The People's Political Council met for the first time in Hankow July 7-16 under the chairmanship of Wang Ching-wei. Of its 200 members, most belonged to the Kuomintang, but there were seven Communists and a few members of the Socialist and Youth parties. The meeting ended with a declaration of the complete unity of all Chinese factions in resisting Japanese aggression. Nevertheless, friction between the Kuomintang and the minority political groups cropped out from time to time. It was reported from Hankow June 12 that activities of groups seeking immediate radical po-

CHINESE VICTORY AT TAIERHCHWANG

Gen. Chiang Kai-shek's Nationalist troops driving the invaders from this South Shantung city early in April, 1938. It was the first severe defeat of Japanese arms by the Chinese.

litical changes had been suppressed in western Chinese cities and their leaders arrested. On August 23 Gen. Chiang Kai-shek's chief of staff ordered the dissolution of all organizations of students and workers in the Wuhan area inspired or sponsored by Communists.

Despite these developments, the Communist Executive Committee's session at Yen-an in November voted for continued co-operation with the Kuomintang. On November 23 the Communists issued a manifesto at Chungking asking permission to join the Kuomintang and the Kuomintang Youth Corps. The manifesto declared that "the present internal and international situation will not permit a one-party dictatorship or the establishment of a soviet socialist state in China." It asserted that the Communists would not establish Communist organizations or carry on their propaganda within the Kuomintang or the army. The Kuomintang leaders were under pressure to accept the Communist overtures. Chiang Kai-shek's German military advisers had been replaced by Soviet officers. And Japan's success in cutting off all munitions imports through Chinese ports had greatly increased China's dependence upon Soviet arms and munitions.

Peace Feelers. The growth of Communist influence was an important factor in a split within the Kuomintang ranks late in December on the issue of making peace with Japan. New Japanese conditions of peace were announced by Premier Konoye on December 22. They included Chinese recognition of Manchoukuo; Chinese adherence to the Berlin-Tokyo-Rome anti-Communist pact or a similar treaty; Chinese consent to the garrisoning of Japanese troops at specified points in China as an anti-Communist measure and the reservation of Inner Mongolia as a special anti-Communist area; freedom of residence and trade in the interior of China for Japanese; and the granting of facilities to Japanese for the development of China's natural resources, especially in North China and Inner Mongolia. Premier Konoye disclaimed demands for Chinese territory (other than Manchoukuo) or war indemnities and promised to respect China's sovereignty. He declared Japan was ready to consider abolition of extraterritoriality and foreign concessions in China, denied any intention to exercise an economic monopoly in China, and promised that Japan would not limit the Chinese interests of other powers "who grasp the meaning of the new East Asia and are willing to act accordingly."

This peace offer proved moderate enough to wean Wang Ching-wei, leader of the conservative anti-Communist minority faction within the Kuomintang ranks at Chungking, away from the anti-Japanese united front. Wang left Chungking on "sick leave" late in December and proceeded to Hong Kong. There on December 31 he issued a statement, addressed to Chiang Kai-shek, declaring that the Japanese terms offered a basis for peace talks. Chiang refused to consider the peace terms, and Wang was expelled from the Kuomintang and all his government posts.

Meanwhile, Chiang proceeded energetically with preparations for a long war of attrition, designed to produce a financial and economic collapse in Japan. With the opening of the long motor highway from Kunming (formerly Yunnanfu) to the Lashio railroad in northeastern Burma late in the year, a new source of munitions supplies became available to China. The Nationalist Government purchased 1000 American motor trucks for the transport of supplies over this road. Construction

of a railway over this route was begun. The other western outlet—the highway from Sian across Sinkiang to the Turksib railway in the Soviet Union—was completed in March. In addition a network of highways connecting the provinces of western and southwestern China for military and commercial purposes was rushed to completion during the year.

Chiang Kai-shek's plans for continued resistance also were bolstered by the rapid industrial development of Szechwan, Yunnan, and other western provinces as the result of the movement of factories and workshops inland from the coast and other Japanese occupied areas. Government officials were active during the Japanese advance upon Hankow in transferring machinery and other industrial equipment westward from the Wuhan cities. A government iron works in Kweichow, with a 50-ton daily capacity, was completed in December. During the year 57 new factories were opened in Szechwan.

Japanese Political and Economic Measures.

Without waiting for the capitulation of the Nationalist Government, the Japanese had commenced to organize and exploit their conquered territories, starting in 1937 (see 1937 YEAR BOOK, p. 159). In 1938 this policy was greatly extended. Additional puppet governments were established in Nanking, Shanghai, Hankow, and Canton, as well as a Mongol autonomous government in the northwest. Late in the year an effort was made to establish a single Japanese-dominated government for all of the territories under Japanese nominal control. Gen. Wu Pei-fu, an old-time Chinese warlord, was selected to head this government, with Peiping as the permanent capital. But Wu reportedly rejected the offer. Despite frequent assassinations by Chinese patriots of persons participating in the puppet regimes, they served as rallying grounds for those Chinese who were tired of war or preferred Japanese domination to possible future subjection to a Chinese Communist state.

Japan's economic program in China was proclaimed by Premier Konoye at the opening of the Japanese Diet on January 22. The basic principle to be followed, he said, was the increase of Japanese productive power "under the one comprehensive scheme covering Japan, Manchoukuo, and China," with the objective of "supplying the articles needed for national defense, promoting all the important industries and expanding our export trade." Foreign Minister Hirota later explained that the plan called for agreements with China covering the exploitation of her natural resources, communications, and trade. The "co-ordination" of China with Japan's economic needs was already under way. A Federal Reserve Bank opened for business in Peiping on March 1 issued a new currency, linked to the yen, for North China. This served to divert trade from other foreign countries to Japan. On June 10 all other Chinese currencies were banned. A new tariff, favoring Japanese goods, was established by the puppet government at Peiping.

The North China Development Co. and the Central China Promotion Co. were organized in Tokyo November 7 under the direction of the Japanese Government, which subscribed half the capital of each. Like the South Manchuria Railway Co. in Manchoukuo, these gigantic holding companies were designed to supervise and control the economic exploitation of their respective regions. Franchises were allotted to various Japanese subsidiaries for the more or less monopolistic exploita-

tion of Chinese resources. Mines, industries, public utilities, transportation, shipping, banking, the import and export trade, and even the marketing of agricultural and pastoral products rapidly passed under the control of influential Japanese capitalists working through the two holding companies. An oil monopoly partially excluded foreign oil companies from North China. Under Japanese pressure Chinese farmers were obliged to raise cotton and other products used as raw materials by Japanese industry, to be paid for with Japanese manufactures. Effective December 1, an embargo measure reduced raw cotton prices in North China and diverted all shipments to Japan.

Chinese and foreign capital was invited to participate in the economic development of China under Japanese direction. The Sino-Japanese Joint Economic Committee on July 1 decided, among other things, "to prevent the wasting of funds resulting from economic rivalry between Japan and China and among similar enterprises, as well as to effectuate, as much as possible, co-operation between Japan and China through joint investments and management." Japanese military authorities at Shanghai announced July 9 that Chinese factories would be turned over to Japanese operators if the owners refused to accept joint Chinese-Japanese management. It was stated that transfers or sales of Chinese industrial properties to nationals of third powers would not be recognized. Management of all Chinese silk mills and filatures throughout the Shanghai-Hangchow-Nanking areas was taken over October 1 by the newly formed Japanese Sericultural Industrial Co. of Central China.

Closing the "Open Door." It had been clear even before the outbreak of the Chino-Japanese war that Japan intended to close the "open door" in China to all foreign individuals and powers except those submitting to Japanese supervision of their investments and trade. The economic and financial measures cited above all served progressively to strangle foreign economic relations with China. But it was not until after Munich and the capture of Canton and Hankow that the Japanese leaders felt sure enough of their ground to proclaim a protectorate over all China.

The Japanese occupation of Canton was in itself notice to Great Britain that her long economic domination of South China was at an end. Immediately afterward brusque warnings were issued that Japan would resort to stronger action than mere diplomatic protests if Britain, France, and the United States continued to aid the Chinese Nationalist Government in any way. On October 26 the Japanese Embassy at Shanghai issued a statement declaring that "Japan cannot admit the inviolability of third powers' property in China and is not responsible for any damages inflicted thereon during actual fighting." On November 3 the Tokyo Government proclaimed that Japan's "immutable policy" called for the establishment of "a new order that will insure the permanent stability of East Asia." The statement continued:

This new order has for its foundation a tripartite relationship between Japan, Manchoukuo, and China in political, economic, cultural, and other fields. Its object is to secure international justice, perfect a joint defense against communism, create a new culture, and realize close economic cohesion throughout East Asia. . . .

Japan is confident that other powers will on their part correctly appreciate her aims and policy and will adapt their attitude to the new conditions prevailing in East Asia. . . .

This invitation to the western powers to get out of China was repeated on November 11 by Yosuke Matsuoka, president of the government-owned

South Manchuria Railway Co., who called on the United States, Great Britain, and other countries, "frankly to recognize Japan's paramount position in East Asia." "Japan's national and racial pride and her tremendous achievements make recognition of her position imperative," he added. On November 18 Foreign Minister Arita declared, in response to an American protest against violation of the Nine-Power Treaties:

It is the firm conviction of the Japanese Government that, in view of the new situation fast developing in East Asia, any attempt to apply to the conditions of today and tomorrow inapplicable ideas and principles of the past would neither contribute toward the establishment of real peace in East Asia nor solve immediate difficulties.

These declarations were supplemented by the activities of Japanese military chiefs in China. Despite foreign protests, the Yangtze River and its tributaries remained closed to all except Japanese commercial traffic on the ground Chinese guerrilla activities and mines made navigation unsafe. Late in November the Japanese began construction of a great military base near Woosung, downstream from Shanghai, and of a large airfield at Shanghai, indicating their intention to remain there permanently. At Tientsin the Japanese sought by obstruction and intimidation to whittle down the control of the various foreign powers over their respective concessions.

United States Upholds Treaty Rights. The United States took the lead in opposing Japan's effort to close the "open door" and establish a protectorate over China. On October 6 Washington protested against the squeezing out of foreign economic interests in China by exchange control, tariff manipulations, monopolistic companies, censorship of mail and telegrams, restrictions on freedom of residence and travel, and other measures of Japanese-controlled puppet regimes. Economic reprisals against Japanese interests in American territories were hinted at if these discriminations against American interests in China continued.

Japan's reply indirectly repudiated the Nine-Power Treaty, which affirmed the "open door" and China's territorial and administrative integrity. This was followed by retaliatory economic measures by the United States. On December 15 the Export-Import Bank at Washington placed a \$25,000,000 credit at China's disposal for the purchase of motor trucks and war supplies in the United States. In addition the U.S. Treasury extended the Chinese-American monetary agreement of July 9, 1937, by which China was enabled to obtain dollar exchange against its gold reserves in New York. An American note delivered at Tokyo on December 31 rejected Japan's "new order" in East Asia, insisted upon observance of the "open door" policy, and demanded respect for "all rights of the United States as they exist." It stated that any change in the Nine-Power and other relevant treaties could be considered only through a conference of all the interested powers. The fact that Great Britain acted along parallel lines, both in extending new credits to China and in upholding the "open door" doctrine, aroused alarm in Japan, where close Anglo-American co-operation was regarded as the only influence capable of changing Japan's course in China.

British Policy Stiffens. The British stood the brunt of Japanese encroachments upon foreign interests and rights in China during 1938, due partly to the shipment of munitions to Chiang Kai-shek's armies through Hong Kong. To prevent the development of closer Anglo-American collaboration, and possibly also because of the firm attitude

of the Roosevelt Administration in the *Panay* incident of December, 1937, the Japanese consistently displayed more consideration of American than British susceptibilities. An Anglo-Japanese accord for meeting foreign obligations secured by Chinese maritime customs was reached on May 2. But with this exception, Anglo-Japanese relations during the year were marked by a succession of futile British protests against Japanese attacks upon British subjects, properties, and treaty rights in China. A firm Anglo-French stand postponed the Japanese occupation of Hainan Island, but British warnings against Japanese encroachments in South China went unheeded. British financial and commercial interests suffered great damage by the destruction of Canton and the isolation of Hong Kong. On October 24 six Japanese planes bombed the British gunboat *Sandpiper* at Changsha, damaging the superstructure but causing no casualties. The Japanese dismissed the bombing as accidental. At Hankow, Tientsin, Shanghai, and other Chinese cities, Japanese antagonism toward the British was particularly marked.

On November 9 a British official declared in the House of Commons that Britain had no intention of lending money to Japan to enable her to complete the domination of China and that she stood squarely behind the Nine-Power Treaty and the "open door" policy. Britain's intention to grant export credits to China was officially announced December 6 and it was reported that part of these credits were made available later in the month. Meanwhile the British had been busy strengthening their fortifications and other defense preparations against a possible Japanese attack on Hong Kong.

French Interests Menaced. The Japanese invasion of South China, posing a threat to the French possessions in Indo-China, aroused alarm in France and an intensification of colonial defense preparations. The Japanese, on the other hand, were resentful over the shipment of arms and munitions to China over the railways from French Indo-China to Kunming in Yunnan Province. Japanese protests against this arms traffic, made early in 1938, were renewed on October 28 with the warning that if the traffic was not ended, "Japan might be compelled in self-defense to take such measures as she deems necessary." The Chinese charged that the French in violation of the commercial treaty of 1930 had repeatedly prevented or delayed shipments to China over these railways. But commencing early in November all war shipments were barred by the French as a result of a deal with Japan under which the Japanese promised not to invade Hainan Island. To forestall Japan in this vital area, the French and British late in June warned the Tokyo Government that they would support each other in opposing Japanese occupation of Hainan. A week later small French forces occupied the strategically placed Parcel Islands, south of Hainan.

The German Attitude. After the failure of German efforts to arrange peace between China and Japan late in 1937 (see 1937 YEAR BOOK), the Reich became progressively more friendly to Japan and cooler toward China. In response to Japanese representations at Berlin, Chiang Kai-shek's German military advisers, headed by General von Falkenhausen, were ordered to return home and German munition shipments to China were halted. The Chinese were reluctant to cancel the advisers' contracts, which had not yet expired, for fear that important military secrets would reach

the Japanese. After some weeks of negotiation on the issue, the Reich recalled its Ambassador at Hankow (June 26). Fearing that Germany was preparing to recognize the Japanese puppet regimes at Peiping and Nanking, the Chinese then permitted the German officers to leave Hankow on July 5. During the year both Hitler and Foreign Minister Ciano of Italy openly declared their sympathy and support of their partner in the Rome-Berlin-Tokyo axis. Italians instructing Chinese aviators had been withdrawn in 1937.

Growth of Soviet Influence. The open hostility manifested by Germany and Italy and the neutral attitude of the United States, Britain, and France threw the Chinese Nationalists increasingly into the arms of the Soviet Union, especially after munitions shipments through Hong Kong and French Indo-China were stopped. Soviet aviators and military instructors replaced the departed Italians and Germans on Chiang Kai-shek's staff. In July it was reported that 500 Russians had arrived to train and organize new Chinese recruits. The Soviet-Japanese clash at Changkufeng on the Manchoukuo-Korean-Siberian frontier in July and August (see MANCHOUKUO under *History*) was also a direct aid to the Chinese, Japan being forced to hold her best troops in reserve in Manchoukuo. The Soviet Union also continued to send some planes and munitions to the Chinese, but Soviet intervention was nevertheless of a limited character. A Chinese mission sent to Moscow in January to seek additional military support was not as successful as had been hoped.

Action by League of Nations. The League Council at its meeting of Jan. 27-Feb. 2, 1938, adopted a resolution reaffirming its moral support of China as against Japan. At another Council meeting on September 11, the Chinese delegate appealed for action against Japan under Article XVII. On September 19 the Council invited Japan to sit with it in considering the Chinese appeal, and when Tokyo ignored the invitation, the Council reported on September 30 that League states were free to apply sanctions against Japan under Article XVI of the Covenant if they desired to do so. The Japanese Foreign Office spokesman on October 3 warned that Japan would adopt counter-measures against any state that applied sanctions against her. None of the League states did apply punitive economic and financial measures under Article XVI up to the end of 1938.

See FRANCE, GERMANY, GREAT BRITAIN, ITALY, JAPAN, MANCHOUKUO, MONGOLIA, TIBET, and UNION OF SOVIET SOCIALIST REPUBLICS under *History*; LEAGUE OF NATIONS; UNITED STATES under *Administration*.

CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF. An organization founded in Portland, Me., in 1881 by the Rev. Francis E. Clark, D.D., a Congregational minister, for the purpose of pledging young people to certain forms of Christian devotion, expression, and service. In 1938 it consisted of 58,000 societies in the United States and Canada, with a membership of more than 2,500,000. Throughout the world there were in the same year approximately 80,000 societies, with a membership of more than 4,000,000 in 105 countries, dominions, and island groups, representing more than 80 evangelical and reformed denominations. These societies were united into national unions which, in turn, composed the World's Christian Endeavor Union.

In 1938 was held the tenth World's Convention at Melbourne, Australia, with 26 nations represent-

ed. This was followed by a world journey of Dr. Poling, the president. The outstanding event of 1937 was the International Convention in Grand Rapids, Mich., and the introduction of a two-year programme under the title, "Christ for the Crisis." The 1939 International Convention will be held in Cleveland, Ohio, in July.

The Rev. Daniel A. Poling, D.D., LL.D., is president, and the Rev. William Hiram Foulkes, D.D., and Mr. Harry N. Holmes are vice-presidents. The official magazine is the *Christian Endeavor World* (monthly). Headquarters are in the World's Christian Endeavor Building, Mt. Vernon and Joy Streets, Boston, Mass.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing, discovered by Mrs. Mary Baker Eddy in 1866 and set forth in her textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first church was established by Mrs. Eddy in Boston in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston, but called more frequently by its adherents, "The Mother Church."

The total number of recognized branches of The Mother Church reported for the fiscal year ending May 31, 1938, was 2805, of which 64 were college and university organizations. During the year 67 churches and societies and 4 college organizations were recognized as branches.

The affairs of The Mother Church are administered by a board of directors, which supervises the work of the board of education, board of lectureship, and committee on publication. The board of education instructs and authorizes students to teach Christian Science. The board of lectureship consists of 24 members who are engaged in delivering free lectures on Christian Science.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees according to the *Manual* of the church, issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include *The Christian Science Journal*, *Christian Science Sentinel*, *Christian Science Quarterly*, and four editions of *The Herald of Christian Science* in the German, French, Dutch, and Scandinavian (Danish, Swedish, and Norwegian) languages, each with the English translation opposite, and in Braille.

The benevolent association of the church conducts sanatoria in Brookline, Mass., and San Francisco, Calif. Pleasant View Home at Concord, N. H., is a home for Christian Scientists of advanced years. Ralph H. Knapp was president of The Mother Church for the year ending May 31, 1938. Headquarters are at 107 Falmouth St., Boston, Mass.

CHRISTMAS ISLAND. The name of two separate islands. (1) An island in the Indian Ocean (10° 30' S. and 105° 40' E.), a dependency of the Straits Settlements. Area, 60 square miles; population (1937), 1313. Phosphate of lime is exported (161,440 tons in 1936 and 162,568 tons in 1937). (2) The largest atoll in the Pacific (2° N. and 157° W.), over 100 miles in circumference, included in the (British) Gilbert and Ellice Islands Colony. It is leased to the Central Pacific Coconut Plantations, Ltd., for a period of 87 years from Jan. 1, 1914. Population (1936), 23.

CHRONOLOGY. The following chronology lists the more important happenings of the year 1938, according to the dates of occurrence. In most

cases, these events are treated in detail under their respective headings. To such articles, particularly those on leading countries and states, such as UNITED STATES, GREAT BRITAIN, and NEW YORK, the reader is referred for additional information. For a list of prominent persons who died during the year, reference should be made to the article NECROLOGY and the more important obituary notices there listed.

January 1—Mayor LaGuardia's 2d Fusion Administration began in N. Y. City as the City Council replaced the Board of Aldermen.

Morrow-Calles oil agreement was abrogated by President Cardenas of Mexico, by stating that only if the U.S. petroleum companies agreed to pay royalties would they be permitted to hold their concessions.

2—900,000 Chinese were under arms to resist Japanese invasion.

H. H. Kung succeeded Chiang Kai-shek as Chinese premier. Generalissimo Chiang Kai-shek had resigned to consolidate Chinese defenses against Japan.

3—U.S. Congress began its regular session.

PWA was upheld unanimously by U.S. Supreme Court in the granting and lending of funds to electric plants of municipalities competing with private enterprise.

5—U.S. Supreme Court Justice George Sutherland announced his retirement, as of January 18, at the age of 75. \$950,000,000 deficit for 1938-39 was forecast in President Roosevelt's annual budget message.

7—President Roosevelt appointed Joseph P. Kennedy and Hugh R. Wilson as ambassadors to Great Britain and Germany, respectively.

Naval talks between Great Britain and Germany were suspended.

Japanese "new order" program for China was rejected by U.S. Department of State.

CHUVASH AUTONOMOUS SOVIET SOCIALIST REPUBLIC. See RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC.

CINCINNATI, UNIVERSITY OF. An institution for the higher education of men and women in Cincinnati, Ohio, founded in 1870. The enrollment for the autumn of 1938 was 10,619, and for the summer session, 1066. There were 689 members on the faculty. The endowment funds for the year amounted to \$9,494,255; the income for the same period was \$397,231. The library contained 449,358 volumes. President, Raymond Walters, Litt.D., LL.D.

CIRENAICA. See LIBYA.

CITY, DISTRICT, STATE, REGIONAL, AND NATIONAL PLANNING. The National Resources Committee continues to be the promoter and co-ordinator of activities in the several fields of American governmental planning. By its exploratory studies it indicates what has been done in each field and the best lines for further accomplishment. For regional areas it provides the assistance of specialists. Recent committee bulletins are: *Regional Planning, The States and Planning, The Future of State Planning, Our Cities, Water Plan-*

ning, Technology and Planning, *Planning Our Resources and Population Problems*. Each contains a list of related publications of the committee. In June, the National Resources Committee had Regional Planning Offices in eight city centers: Boston, Baltimore, Atlanta, Cincinnati, Omaha, Dallas, San Francisco, and Portland, Oregon. Among the states, 45 have planning boards, with legislative authority in 40 cases. Within the last few years, 400 county planning agencies have been set up. Over 1700 cities and towns have developed some form of planning or zoning. Delegation of planning powers to municipalities by a New Jersey legislative act in 1930 was upheld by the New Jersey Supreme Court on March 30 in a suit brought by a West Orange real estate company against the local authorities. At Princeton, N. J., Thomas Square, an area of eight acres north of Nassau Street, was being developed. Thirty projected Colonial type buildings, a theater, hotel, and central heating plant had been completed early in the year. (See *Planning and Civic Comment*, April-June, 1938.) Cincinnati, Ohio, put into use Columbia Parkway, a high-speed road skirting the Ohio River for seven miles, reaching from the heart of the downtown business area to its furthestmost eastern suburb. Of a total cost of over \$8,600,000 there was spent \$4,800,000 for right-of-way. Work was begun in 1929. (See *Engineering News-Record*, Oct. 6, 1938.)

Other Countries. A plan for the central part of Ottawa, Ontario, has been given general approval by the Canadian Government, which retained Jacques Greber, French architect and town planner, to make the plan. The estimated cost is \$30,000,000. The time of completion is put at 25 to 50 years. Early work on the project will be the erection of a Canadian National War Memorial. In England, the city of Manchester has created a residence suburb called Wythenshaw, similar to the recently opened Greenbelt, Md. Ultimately, Wythenshaw will house 100,000 persons. Its maximum density will be 12 families to the acre, compared with 60 in the central area of Manchester. At Sheffield, England, a general development plan has been prepared for the entire city area of 39,600 acres and a more detailed plan has been made for a rectangular area of 710 acres, having the town hall and other public buildings near its center. (See *Journal Town Planning Institute*, May, 1938.) The four German cities of Berlin, Hamburg, Munich, and Nuremberg are being replanned. The Berlin plan provides for the destruction of four of the existing railway stations, the building of two new stations joined by a triumphal way from south to north, along which new ministries, restaurants, cinemas, and shops will be grouped. The project reaches into the suburbs, where housing will be provided for 20,000 families annually, many forced out from the center of Berlin. The intention is to reduce the density of population in central Berlin from 400 to 150 per hectare—162 to 60 per acre. (For illustrated description see *Völkischer Beobachter*, Jan. 28, 1938; abstracted in *Journal Town Planning Institute*, London, April, 1938.) The new town of Pomezia, Italy, the fifth and last rural center on the former Pontine Marshes, was "founded" April 25 and is scheduled to be "inaugurated" Oct. 29, 1939. The four other towns are Littoria, Sabaudia, Pontina, and Aprilia, constructed in 1932-37.

CIVIL AERONAUTICS AUTHORITY.

See AERONAUTICS; UNITED STATES under *Administration*.

CIVIL ENGINEERS, AMERICAN SOCIETY OF. An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, to maintain high professional standards, and to encourage intercourse among men of practical science.

The membership as of Jan. 10, 1939, was 15,811. There were 63 local sections and 118 affiliated student chapters in colleges and universities throughout the United States.

The Spring Meeting of the Society was held in Jacksonville, Fla., Apr. 20-23, 1938, and was a joint meeting with the Florida Engineering Society. At the general session, discussions were had on the pulp and phosphate industries of the Southern states. The 68th Annual Convention met in Salt Lake City, Utah, July 20-23, 1938, the principal feature being a symposium on transportation. The Fall Meeting was held October 12-14, in Rochester, N. Y., and the chief paper was on the development of structural analysis over three centuries. At all of these meetings, sessions were also held by several of the Technical Divisions, presenting papers in their own specific fields.

The Society publishes two monthly magazines: *Civil Engineering*, which presents news of society affairs and articles of more popular appeal; and *Proceedings*, which contains technical papers that are later collated, with discussions, in the yearly volume of *Transactions*.

At the Annual Meeting, held in New York City, Jan. 19-22, 1938, there were awarded medals and prizes for papers published in the "Transactions" for 1936. These included the Norman Medal to J. C. Stevens, the J. James R. Croes Medal to Inge M. Lyse and Bruce G. Johnston, the Thomas Fitch Rowland Prize to Eugene A. Hardin, the James Laurie Prize to Boris A. Bakhmeteff and Arthur E. Matzke, the Arthur M. Wellington Prize to E. C. Harwood, and the Collingwood Prize for Juniors to Victor L. Streeter. The Rudolph Hering Medal of the Sanitary Engineering Division was awarded to W. W. Horner and F. L. Flynt.

The officers of the society in 1938 were: President, Henry E. Riggs; vice-presidents, L. F. Beltinger, R. C. Gowdy, E. N. Noyes, Malcolm Pirnie; secretary, George T. Seabury; treasurer, Otis E. Hovey. Headquarters are in the Engineering Societies Building, 33 West Thirty-ninth Street, New York City.

CIVILIAN CONSERVATION CORPS (CCC). See CHILD WELFARE.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. Organized in 1881 under the leadership of George William Curtis, Dorman B. Eaton, Carl Schurz, Everett P. Wheeler, Charles J. Bonaparte, and others for the purpose of eliminating the spoils system of making appointments to public office, and for the establishment of a career system in the public service.

During 1938 improvements in civil service procedure and extensions of the merit system long sought by the League were embodied in Executive Orders issued by the President in June, to take effect Feb. 1, 1939. Legislation placing in the classified civil service first-, second-, and third-class postmasters, for which the League had worked for many years, was enacted. During the year the League successfully fought several measures making exemptions from the civil service law of Federal agencies or groups of positions (notably the

Labor Standards Board administering the wage and hour law), and requiring Senate confirmation of Federal employees.

Good Government is the League's official publication. The officers in 1938 were: Robert L. Johnson, president; W. W. Montgomery, Jr., chairman of the executive committee; Nicholas Kelley, chairman of the national council; Ogden H. Hammond, treasurer, and H. Eliot Kaplan, executive secretary. Headquarters: 521 Fifth Avenue, New York City.

CIVITAN INTERNATIONAL. An organization composed of selected professional and business men throughout the United States and Canada, who have dedicated themselves to unselfish service to their city, county, State, and Nation. Its three major objectives are the "Building of Good Citizenship," "Curbing of Crime," and "Elimination of Tuberculosis." The first Civitan Club was founded in Birmingham, Ala., in 1917, the name being formed from the Latin "civitas." A total of 355 clubs had been chartered by Dec. 1, 1938.

The 1938 Convention was held in Cincinnati, Ohio, July 3-6. The official organ is *The Civitan* (monthly). The officers for 1938-39 were: President, Forrest G. Miles, Winston-Salem, N. C.; Vice-Presidents, Don McKee, Wheeling, W. Va., and Thos. J. Cole, St. Louis, Mo.; International Secretary, Arthur Cundy, Birmingham, Ala.; and International Treasurer, Dr. J. L. Brakefield, Birmingham, Ala. Headquarters are at Suite 800-16 Farley Bldg., Birmingham, Ala.

CLARK, JOHN BATES. An American political economist, died in New York, Mar. 21, 1938. Born in Providence, R. I., Jan. 26, 1847, he was educated at Brown University and Amherst College (A.B., 1872), and following graduation went to Germany to study under Karl Knies at the University of Heidelberg. After two years of study there he matriculated at the University of Zurich for a short period.

He returned to the United States in 1877 to become professor of political economy and history at Carleton College, Northfield, Minn. In 1882 he became professor of history and political science at Smith College, and thereafter served as professor of political economy at Amherst (Ph.D., 1890), (1892-95), during which period he also lectured in political economy at Johns Hopkins University. On July 1, 1895, he was appointed professor of political economy at Columbia University. He retired on June 30, 1923, with the title of emeritus.

In 1910 upon the organization of the Carnegie Endowment for International Peace, Dr. Clark was invited to head the department of economics and history and to make a study of the economic consequences of war. He called the first meeting at Berne, Switzerland, to formulate a plan for carrying out the research. The outbreak of the War in Europe postponed the second meeting (Aug. 5, 1914), but after the Armistice, Dr. Clark reorganized the work and continued as director of that department until his retirement in 1923.

One of the first of a large group of American economists who did postgraduate work in Germany, his views were influenced by the methods of economic research then popular. This influence was shown particularly in his articles published in *The New Englander*, and in his first major book, *The Philosophy of Wealth* (1895). His theories which dominated American economic philosophy until the World War were propounded in his most important book, *The Distribution of Wealth* (1899).

Honored by American and foreign universities,

in 1927 he was a guest at a banquet held in his honor, and, in the following year, a volume of economic essays in his honor was published by his colleagues, friends, and former students. He was president of the American Economic Association during 1893-95 and edited *Political Science Quarterly* from 1895 to 1911.

Other of his published works, exclusive of monographs and special articles, included *Capital and Its Earnings* (1888); *Wages* (1889); *The Control of Trusts* (1901); *The Problem of Monopoly* (1904; revised, in collaboration with John Morris Clark, 1912); *Essentials of Economic Theory* (1907).

CLARK UNIVERSITY. A nonsectarian university in Worcester, Mass., founded in 1887. The registration for the autumn of 1938 was 380. The enrollment for the summer session was 202. There were 40 members on the faculty. The productive funds amounted to approximately \$5,000,000. The library contained 157,000 volumes. During 1938, a new gymnasium was completed at a cost of \$175,000, and an auditorium and an addition to the library, to cost \$250,000, were under construction. President, Wallace W. Atwood, Ph.D.

CLOISTERS, THE. See ARCHITECTURE; ART MUSEUMS.

COAL. Total coal production in the United States in 1938 was less than in 1937. Bituminous (soft) coal production in 1938 as compiled from weekly reports of the National Bituminous Coal Commission totaled 347,849,000 net tons, compared to 442,455,000 in the previous year, showing a decrease of 84,606,000 tons or about 21 per cent. Production of Pennsylvania anthracite amounted to 45,674,000 net tons, compared to 50,915,000 of the previous year, indicating a decrease of around 12 per cent. Both bituminous and anthracite producers had an unsatisfactory year, caused in part by labor troubles, and by Federal and State bills attempting to regulate the coal industry. Anthracite producers were also adversely affected by mild weather, which reduced the consumption of coal for heating purposes. According to the U.S. Bureau of Foreign and Domestic Commerce, 324,013 tons of anthra-

PRELIMINARY STATISTICS OF COAL PRODUCTION IN 1938 WITH FIGURES FOR 1937

[Figures in net tons]

State or Territory	1937	1938
Alaska	130,000	132,000
Alabama	12,400,000	10,848,000
Arkansas and Oklahoma	3,200,000	2,512,000
Colorado	7,153,000	5,452,000
Georgia and North Carolina ..	15,000	22,000
Illinois	51,240,000	39,929,000
Indiana	17,270,000	13,949,000
Iowa	3,690,000	3,391,000
Kansas and Missouri	7,044,000	6,054,000
Kentucky	47,053,000	38,874,000
Maryland	1,570,000	1,302,000
Michigan	561,000	469,000
Montana	3,075,000	2,853,000
New Mexico	1,795,000	1,333,000
North and South Dakota	2,152,000	2,174,000
Ohio	24,500,000	18,015,000
Pennsylvania (bituminous) ..	110,160,000	78,721,000
Tennessee	5,292,000	4,464,000
Texas	879,000	890,000
Utah	3,750,000	2,939,000
Virginia	13,558,000	12,400,000
Washington	2,010,000	1,591,000
West Virginia	118,050,000	94,113,000
Wyoming	5,930,000	5,176,000
Other	25,000	29,000
Total bituminous	442,455,000	347,849,000
Pennsylvania anthracite	50,915,000	45,674,000
Total	493,370,000	393,523,000

[This table compiled from weekly coal reports of the National Bituminous Coal Commission.]

cite valued at \$2,350,322 were imported into the United States in 1938; 1,704,385 tons, valued at \$14,634,504 were exported. Of bituminous coal, 165,079 tons valued at \$722,215 were imported and 9,366,312 tons valued at \$38,104,926 were exported.

The National Bituminous Coal Commission has been engaged in carrying out the Bituminous Coal Act of 1937. The Commission has been working on the re-establishing of minimum prices and marketing rules and regulations, since those established in December, 1937, were revoked by Commission Order No. 230 of Feb. 24, 1938. Whether there will be any real relief by the Commission of the unsatisfactory mine prices of coal is doubted by many producers, because if prices are raised there will be more competition from gas and oil.

A survey of the anthracite industry by the Anthracite Institute of New York, showed that 1938 had been a trying year. Unfavorable influences were decisions advanced by the Interstate Commerce Commission, Pennsylvania Public Utility Commission, Canadian trade agreement, and the Lauck Commission bills introduced before the Pennsylvania Legislature at Harrisburg, Penn. The Lauck Commission bills, the Anthracite Institute states, are designed to put anthracite production and marketing under complete control of a permanent State Commission, and regulating the business of mining and selling hard coal by exercise of the right of eminent domain.

COFFMAN, LOTUS DELTA. An American educator, died in Minneapolis, Minn., Sept. 22, 1938. Born near Salem, Ind., Jan. 7, 1875, he was educated at the Indiana State Normal School, Indiana State University (A.B., 1906), and Columbia University (Ph.D., 1911). During 1896-1907 he was connected with the school system of Indiana, and thereafter he was supervisor of the Training School, Charleston, Ill., (1907-09, 1911-12); a student (1909-10) and a lecturer (1910-11) at Columbia University; professor of education, University of Illinois (1912-15), dean, College of Education, University of Minnesota (1915-20), and president of the University of Minnesota from July 1, 1920. Under his administration the student body increased 100 per cent, many new buildings were erected, and the curriculum was expanded to fit the needs of all its students.

Actively interested in educational affairs, Dr. Coffman was visiting professor for the Carnegie Endowment for International Peace to New Zealand and Australia in 1931; visiting lecturer at the University of the Philippines in 1932; expert consultant to the U.S. Department of the Interior, Land Grant College Survey, 1928-30; and the National Survey of School Finance in 1931. He was one of a group of educators who visited the Soviet Union in 1928, and served as president of the National Society for the Study of Education (1917-18), of the Association of Urban Universities (1921-22), and of the National Association of State Universities (1930).

He wrote *The Social Composition of the Teaching Population* (1911); *Teacher Training Departments in Minnesota High Schools* (1920); *The State University: Its Work and Problems* (1934), and was the co-author of numerous textbooks. Besides co-editing the *Journal of Educational Ad-*

ministration and Supervision from 1922, Dr. Coffman made many educational surveys throughout the country during the years 1916-33.

COINS, CURRENCIES, VALUE OF FOREIGN. The legal estimates of the value of foreign moneys on Jan. 1, 1939, as issued by the U.S. Secretary of the Treasury, are given in the table on page 167.

COLBY COLLEGE. A nonsectarian college for men and women at Waterville, Me., founded in 1813. The enrollment for the autumn term of 1938 was 675. The faculty numbered 52. The endowment amounted to \$2,734,748. Total income was \$319,883, of which \$93,330 was from interest on investment, \$223,077 from student fees and sundry, and \$3475 from gifts. The library contained 93,000 volumes. A new model campus is being built to cost \$3,000,000. President, Franklin W. Johnson, L.H.D., LL.D.

COLGATE UNIVERSITY. A nonsectarian institution for the higher education of men in Hamilton, N. Y., founded in 1819. In the autumn of 1938, there were 1071 students enrolled. The faculty numbered 107 members. The productive funds amounted to approximately \$6,555,000, and the income for the year \$732,000. The library contained 110,000 volumes. President, George Barton Cutten, Ph.D., LL.D., D.D., Pd.D., L.H.D.

COLLECTIVE BARGAINING. See LABOR.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLOMBIA. A South American republic,

third in population and area among the states of that continent. Capital, Bogotá.

Area and Population. The area is estimated at about 448,794 square miles and the population in 1938 was estimated at 8,698,634 compared with 7,851,000 at the 1928 census. In 1928 the population was 35 per cent white, 5 per cent Negro, 2 per cent pure Indian, and 58 per cent of mixed blood. There were 24,383 foreigners in the country in 1938, including 3215 Spaniards, 2977 Germans, 2887 United States citizens, 2683 Ecuadoreans, 1944 British, 271 Chinese, and 206 Japanese. Living births registered in 1937 numbered 239,939 (27.1 per 1000 of population); deaths, 123,201 (13.9); marriages, 39,147 (4.4). Estimated populations of the chief cities in 1937 were: Bogotá, 420,000; Barranquilla, 180,000; Medellín, 150,000; Cartagena, 130,000; Cali, 120,000; Manizales, 100,000; Ibagué, 75,000; Cúcuta, 74,000; Bucaramanga, 68,000; Pasto, 60,000.

Education and Religion. The 1928 census showed that about 48 per cent of the adult inhabitants were illiterate. In 1936 there were 8314 public elementary schools, with 551,961 pupils; 160 continuation schools, with 10,000 pupils; 390 secondary and normal schools, with 28,000 students; 35 professional schools, with 2803 students; 165 night schools for workers, with 8696 students; 11 music and art schools, with 780 students; and 5 universities, with 2948 students (1935). Primary education was made free and compulsory in 1936. The Roman Catholic Church was disestablished as the state church in 1936. The great majority of Colombians profess that faith, but freedom of worship exists for other religions.

Production. The production of raw materials and foodstuffs for export is the basis of the national economy. Coffee, bananas, petroleum, and gold accounted for 94.9 per cent of the value of all exports in 1936. Colombia is the world's chief source of mild coffee and ranks second to Brazil in total production. Estimated yields of the principal crops were (in metric tons): Coffee, 258,000 in 1937-38 (267,000 in 1936-37); cacao, 9955 in 1937-

VALUES OF FOREIGN MONEYS—JAN. 1, 1939

Country	Monetary unit	U.S. money	Remarks
Argentine Republic	Peso	\$1.6335	Given valuation is of gold peso. Paper nominally convertible at 44 % of face value. Conversion suspended Dec. 16, 1929.
Australia	Pound	8.2397	Control of gold stocks and exports authorized Dec. 17, 1929.
Belgium	Belga	.1695	Decree of Mar. 31, 1936. Belga = 5 Belgian francs.
Bolivia	Boliviano	.6180	Conversion of notes into gold suspended Sept. 23, 1931.
Brazil	Milreis	Conversion of Stabilization-Office notes into gold suspended Nov. 22, 1930.
British Honduras	Dollar	1.6931	Conversion of notes suspended.
Bulgaria	Lev	.0122	Exchange control established Oct. 15, 1931.
Canada	Dollar	1.6931	Embargo on export of gold, Oct. 19, 1931; redemption of Dominion notes in gold suspended Apr. 10, 1933.
Chile	Peso	.2060	Given valuation is of gold peso. Gold pesos received for conversion at rate of 4 paper pesos for 1 gold peso. Conversion of notes suspended July 30, 1931.
China	Yuan	Silver standard abandoned by decree of Nov. 3, 1935; bank notes legal tender under Currency Board control; exchange rate for British currency fixed at 1s. 2½d., or 29½¢ U.S., per yuan.
Hong Kong	Dollar	Treasury notes and notes of the three banks of issue made legal tender by silver nationalization ordinance of Dec. 5, 1935; exchange fund created to control exchange rate.
Colombia	Peso	.5714	Obligation to sell gold suspended Sept. 24, 1931. Gold content of .56424 grams of gold 9/10 fine established by law of Nov. 19, 1938, effective Nov. 30, 1938.
Costa Rica	Colon	.7879	Conversion of notes into gold suspended Sept. 18, 1914; exchange control established Jan. 16, 1932.
Cuba	Peso	1.0000	By law of May 25, 1934.
Czecho-Slovakia	Koruna	.0351	By decree of Oct. 9, 1936.
Denmark	Krone	.4537	Conversion of notes into gold suspended Sept. 29, 1931.
Dominican Republic	Dollar	1.6931	U.S. money is principal circulating medium.
Ecuador	Sucre	.3386	Conversion of notes into gold suspended Feb. 9, 1932.
Egypt	Pound (100 piasters)	8.3692	Conversion of notes into gold suspended Sept. 21, 1931.
Estonia	Kroon	.4537	Conversion of notes into gold suspended June 28, 1933.
Finland	Markka	.0426	Conversion of notes into gold suspended Oct. 12, 1931.
France	Franc	Provisions of Monetary law of Oct. 1, 1936, providing for gold content of franc, superseded by decree of June 30, 1937, which stated that the gold content of the franc shall be fixed ultimately by a decree adopted by the Council of Ministers. Pending such decree a stabilization fund shall regulate the relationship of franc and foreign currencies.
Germany	Reichsmark	.4033	Exchange control established July 13, 1931.
Great Britain	Pound Sterling	8.2397	Sale of gold at legal monetary par suspended Sept. 21, 1931.
Greece	Drachma	.0220	Conversion of notes into gold suspended Apr. 26, 1932.
Guatemala	Quetzal	1.6931	Conversion of notes into gold suspended Mar. 6, 1933.
Haiti	Gourde	.2000	National bank notes redeemable on demand in U.S. dollars.
Honduras	Lempira	.8466	Gold exports prohibited Mar. 27, 1931; lempira circulates as equivalent of half of U.S. dollar.
Hungary	Pengó	.2961	Exchange control established July 17, 1931.
India (British)	Rupee	.6180	Sale of gold at legal monetary par suspended Sept. 21, 1931.
Indo-China	Piaster	Piaster pegged to French franc at the rate of 1 piaster = 10 French francs; exchange of notes for gold ended Oct. 2, 1936.
Ireland	Pound	8.2397	Conversion of notes into gold suspended Sept. 21, 1931.
Italy	Lira	.0526	New gold content of 46.77 milligrams of fine gold per lira established by monetary law of Oct. 5, 1936.
Japan	Yen	.8440	Embargo on gold exports Dec. 13, 1931.
Latvia	Lat	Currency pegged to sterling Sept. 28, 1936, at 2522 lati = £100.
Liberia	Dollar	1.6931	British money is principal circulating medium.
Lithuania	Litas	.1693	Free export of gold suspended Oct. 1, 1935.
Mexico	Peso	Decree of Aug. 28, 1936, left the monetary unit, the peso, to be later defined by law.
Netherlands and colonies	Guilder (florin)	.6806	Suspension of convertibility of notes into gold and restrictions placed on free gold exports—Sept. 26, 1936.
Newfoundland	Dollar	1.6931	Newfoundland and Canadian notes legal tender.
New Zealand	Pound	8.2397	Conversion of notes into gold suspended, gold exports curbed, Aug. 5, 1914; exchange rules December, 1931.
Nicaragua	Cordoba	1.6933	Embargo on gold exports Nov. 13, 1931.
Norway	Krone	.4537	Conversion of notes into gold suspended Sept. 29, 1931.
Panama	Balboa	1.6933	U.S. money is principal circulating medium.
Paraguay	Peso (Argentine)	1.6335	Paraguayan paper currency is used; exchange control established June 28, 1932.
Persia (Iran)	Rial	.0824	Obligation to pay out gold deferred Mar. 13, 1932; exchange control established Mar. 1, 1936.
Peru	Sol	.4740	Conversion of notes into gold suspended May 18, 1932.
Philippine Islands	Peso	.5000	By act approved Mar. 16, 1935.
Poland	Zloty	.1899	Exchange control established Apr. 27, 1936.
Portugal	Escudo	.0749	Gold exchange standard suspended Dec. 31, 1931.
Rumania	Leu	.0101	Exchange control established May 18, 1932.
Salvador	Colon	.8466	Conversion of notes into gold suspended Oct. 7, 1931.
Siam	Baht (Tical)	.7491	Conversion of notes into gold suspended May 11, 1932.
Spain	Peseta	.3267	Exchange control established May 18, 1931.
Straits Settlements	Dollar	.9613	British £ sterling, Straits \$ and half \$ legal tender.
Sweden	Krona	.4537	Conversion of notes into gold suspended Sept. 29, 1931.
Switzerland	Franc	Order of Federal Council enacted Sept. 27, 1936, instructed the Swiss National Bank to keep gold parity of franc at value ranging from 190 to 215 milligrams of fine gold.
Turkey	Piaster	.0744	100 piasters equal to the Turkish £; conversion of notes into gold suspended 1916; exchange control Feb. 26, 1930.
Union of South Africa	Pound	8.2397	Conversion of notes into gold suspended Dec. 28, 1932.
U.S.S.R.	Chervonetz	8.7123	Conversion of notes into gold suspended Aug. 2, 1914; exchange control since Sept. 7, 1931. Gold content of .585018 grams pure gold per peso, law of Jan. 12, 1938.
Uruguay	Peso	.6583	Exchange control established Dec. 12, 1936.
Venezuela	Bolivar	.3267	Exchange control established Oct. 7, 1931.
Yugoslavia	Dinar	.0298	Exchange control established Oct. 7, 1931.

* At par as regards gold units; nongold units have fixed par with gold.

38; cane sugar, 28,800 in 1936-37; tobacco, 10,700 in 1936-37; rice, 48,722 in 1937-38; wheat, 64,127 in 1937-38; corn, 500,000 in 1934-35; potatoes, 225,000 in 1934-35. Banana exports in 1936 were 159,648 metric tons, valued at 8,207,000 pesos. Live-stock slaughtered in 1937 included 1,012,000 cattle and calves, 104,000 sheep, and 550,000 swine. Production of the chief minerals in 1937 was: Petroleum, 20,054,798 bbl. (of 42 gal.) against 18,751,964 bbl. in 1936; gold, 442,222 troy oz.; platinum, 29,314 troy oz.; salt, 2,928,962 pesos. Output of other minerals was (in metric tons): Cement, 105,000 in 1936; coal (transported by rail), 445,000 in 1936; silver, 5.2 in 1937. Emeralds, copper, lead, mercury, and cinnabar are found. Manufacturing is confined largely to oil refining and to the fabrication of articles for local consumption. Manufactured and partly manufactured goods comprise about 90 per cent of all imports.

Foreign Trade. Imports, including bullion and specie, totaled 167,800,000 pesos (\$95,341,000) in 1937 as against 120,037,000 pesos (\$68,593,000) for 1936. The 1937 import statistics are based on the c. i. f. value at port of entry, while figures for earlier years were based on values declared in consular invoices. Consequently the 1937 values should be reduced by 12 per cent to be comparable to those for 1936. Exports in 1937, excluding gold, were valued at 150,071,000 pesos (\$85,268,000) against 136,844,000 pesos (\$78,197,000) in 1936. The value of the leading 1937 exports was: Coffee, 97,963,000 pesos (91,968,000 in 1936); crude petroleum, 35,079,000 pesos (28,267,000); gold, 31,753,000 pesos (20,788,000); bananas, 6,983,000 pesos (8,207,000); cattle, hides, 4,979,000 pesos (3,499,000); platinum 2,666,000 pesos (3,184,000). The United States furnished 48.5 per cent of the 1937 imports by value (41.3 per cent in 1936); United Kingdom, 18.7 (18.3); Germany, 13.5 (22.3). Of the 1937 exports, the United States took 56.7 per cent (54.3 in 1936); Germany, 12.6 (16.5); France, 5.1 (4.5).

Finance. In the budget estimates for 1939, ordinary receipts and expenditures balanced at 89,249,000 pesos and extraordinary receipts and expenditures at 1,959,000 pesos. For 1938 the respective totals were 81,568,000 pesos and 3,792,000 pesos. Actual receipts for 1937 were (in pesos): Ordinary, 82,606,000; extraordinary, 8,286,000; extra-budgetary, 1,630,000; total, 92,522,000. Actual 1937 expenditures were: Ordinary, 76,688,000; extraordinary, 9,052,000; extra-budgetary, 1,630,000; total, 87,370,000. The public debt on Dec. 31, 1937, amounted to 177,047,000 pesos, divided as follows: External funded, at par, 62,469,000 (excluding unpaid interest); internal funded, 47,387,000 (excluding unpaid interest); internal irredeemable, 2,054,000; external floating and short-term, 32,767,000 (at 1.80 pesos to the dollar and 0.06 to the franc); internal floating and short-term, 32,370,000. The Colombian pesos (par value, \$1.6449) had an average exchange value of \$0.5450 in the official market and \$0.5494 in the curb market in 1937 (\$0.571 and \$0.546 in 1936).

Transportation, etc. The Magdalena River, navigable to 500-ton vessels for 514 miles from Barranquilla, is the main traffic artery. Port improvements made Barranquilla accessible to ocean steamers in 1936. The railways in 1937 had 2022 miles of line; nearly 1300 miles were under construction. The Colombian Government purchased the North Eastern Railway from private owners for 11,600,000 pesos under the law of Nov. 30, 1938. Roads and highways in 1937 extended 16,637 miles; there were 19,435 automobiles in the same year.

The Bogotá-Quito automobile highway was completed with the opening of the Cali-Popayan section during 1938. Work was begun in 1938 on an extension of the Medellín-Cauca Valley highway to the Gulf of Uruba, where a port was to be constructed. Various other highway projects were under way. Air services in operation in 1938 covered 7401 miles of route.

Government. The Constitution of Aug. 5, 1886, vests executive power in a President elected for four years by direct popular vote and ineligible for re-election for four years after completion of his term. A Congress of two houses exercises the legislative power. The Senate has 56 members, elected for four years by departmental Assemblies; the Chamber of Deputies, 118 members, elected for two years by direct suffrage. President at the beginning of 1938, Dr. Alfonso López (Liberal), who assumed office Aug. 7, 1934. Under his leadership, extensive amendments to the Constitution were voted on Aug. 1, 1936 (see 1936 YEAR BOOK, pp. 174 f.).

HISTORY

Santos Elected President. Dr. Eduardo Santos, whose election as President of Colombia was forecast by developments in 1937 (see 1937 YEAR BOOK, p. 169), was elected without opposition on May 1 and was inaugurated on August 7. Both the Conservatives and Communists abstained from voting, not because of compulsion but because they regarded a Liberal electoral victory as certain. About 500,000 voters cast their ballots for Dr. Santos. For the first time in Colombian history, the selection of a President took place without election disorders. On May 13, however, a clash between Liberals and Conservatives in which four Liberals were killed was reported in Villacaro, a town in the State of North Santander.

The inauguration of Dr. Santos on August 7 was the outstanding feature of the celebration of the fourth centenary of the founding of Bogotá. Three large U.S. Army bombers flew to Bogotá from Miami, Fla., to participate in the inaugural ceremonies and special representatives of most of the American governments were present. The anniversary festivities were saddened, however, by the disaster attending the opening of a great new military field at Bogotá on July 24. A military plane, stunting low over the field, crashed into part of a crowd of 50,000 people gathered to watch a review, killing and mortally wounding 60 and injuring 150 others.

The assumption of power by Dr. Santos, a noted diplomat, newspaper publisher, and chairman of the Liberal party, marked a swing toward the center from the more radical government of President López. Dr. Santos declared his policy would be the unification of the economic and social forces of the nation, an objective obstructed by the violence of political and social conflicts. Opposing the program of international political action adopted by the convention of the National Labor Union at Cali on January 24, he likewise spoke out against fascism and pledged his government to defend democracy and civil liberties. The foreign policy announced in his inaugural address and subsequently elaborated, called for the readjustment of the foreign debt on a basis acceptable to the Colombian Government and its creditors, the welcoming of foreign capital provided it obeyed Colombian laws, revision of the Concordat with the Vatican, and support of Pan Americanism but retention of Colombia's membership in the League of Nations so

long as hope of the acceptance of the League's principles remained. The key figures in his new cabinet included: Minister of Government, Carlos Lozano y Lozano; Foreign Relations, Luis López de Meza; War, José Joaquín Castro Madrid; Internal Affairs, Carlos Lleras Restrepo.

Legislation. In the first session of Congress during 1938, ended on May 26, the Constitution was further amended to provide for one annual five-months' session of Congress beginning July 20, 1939, instead of meeting twice a year as in 1937 and 1938. Other measures adopted included a decree making traffic regulations uniform throughout the Republic, a bill for a 5,000,000 peso increase in the War Department's annual budget, a new code of criminal procedure, a law for the protection of expectant mothers, and a decree extending additional credit facilities to remote districts of the Republic through the establishment of territorial credit banks. In the second session of Congress opening July 20, laws were passed authorizing the establishment of a state-supported iron and steel industry, the creation of an advisory committee to assist the government in negotiating an agreement with foreign creditors for liquidation of the defaulted public debt, and the devaluation of the Colombian peso. The peso was stabilized at 1.75 to the dollar by specifying as the monetary unit a coin containing 900 parts of fine gold and weighing 0.56424 grams. The law also authorized the government to negotiate a modification of its contract of Oct. 31, 1934, with the Bank of the Republic and to define the manner in which debts originally contracted in foreign moneys, coined gold, and legal currency could be settled in national bills representing gold or Bank of Republic notes. Another law directed the government to acquire shares of the Agricultural Mortgage Bank held by municipalities. Other legislation established new ministries of National Economy and Labor and of Hygiene and Social Welfare, and provided for reforestation and the establishment of a chemical industry.

Political Developments. Heated and lengthy debates on two important issues delayed the work of Congress. One issue involved the bill to repeal a section of a 1931 law barring intervention by labor unions in the military policies of the country. The rise of political unionism as a result of the rapid spread of unions since the Liberals returned to power in 1930, accounted for the interest in this issue. The National Labor Union convention in January approved the establishment of a continental labor federation to fight fascism and defend the interests of the laboring classes. It demanded revision of foreign-owned concessions and nationalization of railways, of shipping on Colombian rivers, and of oil and other mineral deposits. The convention also advocated union representation on the boards of directors of private corporations and of the National Railways, and opposed the obligatory arbitration of labor disputes. Dr. Santos's newspaper, *El Tiempo*, asserted that the convention was controlled by radical politicians opposed to the Liberal government and party.

The second issue delaying legislation was the strike conducted by students of the secondary schools against the requirements established by the Liberal regime for entrance into the universities. Most of the secondary schools were established by the Catholic Church during the Conservative period of domination and were opposed to supervision by the Liberal government. The strike broke out early in May in Bogotá and other cities and

assumed such violence that the police used tear gas bombs and fire hose on the strikers. After four persons had been killed and 40 wounded during a riot in Pasto, the government on May 13 prohibited all public demonstrations. Both the government and the Liberal press denounced the strike as a subversive movement against the Liberal regime instigated by the Conservatives. The strike died down in the middle of May after a special commission was named to study the problem.

Other Internal Developments. The influx of Jewish and anti-Nazi refugees into Colombia from Germany continued in 1938. The discovery of a scheme for the entrance of additional Jewish refugees with fraudulent passports led the police on June 29 to order all foreign residents to present their passports for verification of their authenticity. Anti-Semitism was reported on the increase. In connection with the government's program of agricultural development a national cotton board of six members was appointed in March to promote the cotton-growing and yarn industries. The agricultural program received a setback when the United Fruit Co. suspended new plantings and development work on its banana plantations, indicating that it would confine its activities in Colombia to buying from native planters. This action was attributed to the company's difficulties with both labor unions and the government. The government had charged an American and two Colombian agents of the company with the bribery of legislators. The Colombian Supreme Court on May 9 upheld the government's suit to collect an oil pipe-line tax of 2½ per cent of the operating revenues from the Andian National Corporation. Nevertheless, heavy foreign investments in the Catatumbo and other oil fields continued, especially by the Shell company.

Foreign Relations. The growing trade between the United States and Colombia resulting from the reciprocal commercial pact effective May 20, 1936, was accompanied by a tightening of diplomatic ties. Dr. Santos visited the United States in March and seized the occasion to affirm his firm support of President Roosevelt's "good neighbor" policy. In October the legations of the United States and Colombia in Bogotá and Washington, respectively, were simultaneously raised to the rank of embassies. In February the Liberal Senator José Combariza in a speech in the Senate urged an alliance with the United States to protect Colombian democracy against the growth of fascism in Peru, Ecuador, and Brazil. Colombia joined with the Dominican Republic in drafting a plan for an American league of nations submitted to the Pan American Conference at Lima in December. (See PAN AMERICAN CONFERENCE.) It was announced November 9 that Colombia and Brazil had agreed to raise their respective legations to embassies.

Strained relations between Colombia and Germany ensued when Berlin police held the Colombian Minister-designate, Jaime Jaramillo Arango, and members of the legation staff for taking pictures of the anti-Jewish excesses in the German capital on November 10. The Bogotá Government immediately withdrew the diplomat and the first secretary of the legation from Germany, later transferring them to Copenhagen. Reich officials said that Hitler had refused to receive Jaramillo Arango for the presentation of his credentials and had demanded the first secretary's expulsion. On November 26 it was announced at Washington that a United States military aviation mission and a naval

mission would be sent to Colombia at the request of that government. Venezuela and Colombia raised their respective legations to embassies on December 7.

COLORADO. Area and Population. Area, 103,948 square miles; included (1930) water, 290 square miles. Population: Apr. 1, 1936 (census), 1,035,791; July 1, 1937 (Federal estimate), 1,071,000; 1920 (census), 939,629. Denver, the capital, had (1930) 287,861 inhabitants; Pueblo, 50,096.

Agriculture. The accompanying table shows the acreage, production, and value of the chief crops of Colorado for 1938 and 1937.

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame) .	1938	1,062,000	1,863,000 *	\$11,364,000
	1937	1,022,000	1,661,000 *	12,956,000
Sugar beets .	1938	137,000	1,984,000 *
	1937	160,000	1,992,000 *	9,562,000
Wheat	1938	1,339,000	19,415,000	9,708,000
	1937	1,136,000	15,155,000	13,791,000
Potatoes	1938	91,000	11,830,000	6,506,000
	1937	106,000	15,688,000	7,060,000
Corn	1938	1,078,000	11,319,000	5,320,000
	1937	1,067,000	8,536,000	5,378,000
Dry beans ...	1938	312,000	1,498,000 *	4,410,000
	1937	244,000	781,000 *	2,702,000
Barley	1938	510,000	11,985,000	3,476,000
	1937	408,000	8,772,000	4,474,000
Oats	1938	163,000	5,053,000	1,314,000
	1937	143,000	4,433,000	1,685,000

* Tons. * 100-lb. bags.

Mineral Production. The yearly production of coal in Colorado attained some 7,153,000 net tons for 1937, as against 6,811,802 (value \$16,277,000) for 1936. The mining of molybdenum by the Climax Molybdenum Company continued in 1937 to make extraordinary progress. In the form of concentrate, ore produced in that year contained 22,750,368 lb. of metal, an increase of nearly 50 per cent over the total for 1936. This mine was the only producer of molybdenum in the State and was reckoned to furnish 71 per cent of the world's current output.

As to the mining of gold, silver, copper, lead, and zinc, preliminary approximations of Colorado's production were issued for 1938. The recoverable value of the five metals in the ore mined during the year was about \$22,020,731 for 1938, or very nearly the \$22,107,207 for 1937. The comparison with 1937's total was more favorable than in a number of the other Mountain States producing these metals, where declines ran to 30 and even 50 per cent. In this State, the predominance of gold and silver, both bought by the Government without reference to ordinary considerations of supply and demand, helped keep production up; also, in Eagle County, where most of the silver and copper were mined, the Empire Zinc Company's mining of recently developed ore on Battle Mountain, containing copper, silver, and gold, went on increasing, despite lower prices in the metal-markets.

Reckoned in terms of recoverable metal in ores, the yearly production of gold rose to some 370,100 oz. (1938), from 368,905 (1937); by value, to \$12,953,500, from \$12,911,675. That of silver, to 7,776,600 oz. (1938), from 6,260,963 (1937), and to \$5,072,297, from \$4,842,646. That of copper, to some 27,090,000 lb. (1938), from 21,868,000 (1937); in value, \$2,654,820 (1938), about the same as the previous year's \$2,646,028. The value of the year's production of lead dropped below \$1,000,000, and that of the output of zinc below \$500,000, although both were produced in somewhat greater quantity than in 1937. Mining was, as usual, widespread: a score of counties were substantial producers of

one or more of the five metals, and six attained production in excess of \$1,000,000.

At Climax the production of molybdenum (in concentrates) rose to 28,150,000 lb. (1938), from 22,750,368 (1937).

Finance. Colorado's State expenditures in the year ended June 30, 1937, as reported by the U. S. Bureau of the Census, were: For maintaining and operating governmental departments, \$30,926,094 (of which \$13,628,422, or 44 per cent, was for charities, \$5,675,417 was for highways, and \$720,159 was apportioned for local education); for interest on debt, \$347,045; for capital outlay, \$17,881,798. Revenues were \$40,683,396. Of these, property taxes furnished \$3,467,828; sales taxes, \$16,328,465 (including tax on gasoline, \$7,123,276); departmental earnings, \$2,804,393; sale of licenses, \$3,160,500; unemployment compensation, \$2,320,010; Federal or other grants-in-aid, \$9,745,655. Funded debt outstanding on June 30, 1937, totaled \$30,055,700. None of it was offset by sinking-fund assets. On an assessed valuation of \$1,103,563,605 the State levied in the year ad-valorem taxes of \$3,352,991.

Education. Colorado's inhabitants of school age, as reckoned for April, 1938, numbered 314,212. In the scholastic year 1936-37, the latest covered by the data that follow, enrollments of pupils in the public schools totaled 254,665. This comprised 178,593 in the elementary group, 56,624 in high schools, and 19,448 otherwise classified (kindergartens, opportunity classes, and evening classes). The year's expenditure for public-school education totaled \$22,648,594. Teachers numbered 9131; their yearly salaries averaged \$1196.63. This did not include 374 administrators in the public-school system, whose salaries averaged \$2569.

The distribution of funds from Colorado's income tax, for the support of public schools, went into effect. The *Journal* of the National Education Association reported that the operation of the public junior colleges had been merged with that of the public-school system, and that by terminating county examinations for certification of teachers, further certifications had been restricted to those issued by the State teachers' colleges and by the State Department of Education.

Charities and Corrections. The State's Department of Public Welfare (Earl M. Kouns, Director) was the administrative authority for the State's payments of support to several groups of needy inhabitants; in particular, old-age assistance. The latter part of its duty involved, during 1938, the most conspicuous and controversial feature in Colorado's internal affairs. The payments made to the elderly indigents, as may be seen from particulars given under *Events*, below, were burdensome to the State's finances and fell short of the intended \$45 a month that the popular vote of 1936 had made a constitutional requirement. The State institutions having care or custody of persons were administered by respective managing boards. See *OLD AGE PENSIONS*.

Political and Other Events. The State's law devoting some of its most productive taxes to the payment of the old-age pension at the rate of \$45 a month continued to burden the State government and to rouse opposition and discontent. The recipients at the outset of 1938 numbered 34,804. The monthly total paid them varied greatly, as it was limited by the receipt of means from the available sources. At the full rate it would have approximated \$18,000,000 a year, allowance made for deduction in the cases of pensioners who had small

means of their own. This sum, diminished by the amount of the corresponding Federal contribution, came to some \$11 per capita of the population. Actually the payments for the year, despite the addition of "jackpots" or extra payments at some occasions, as the law required, ran considerably below the prescribed total. A County Judge ruled (April 22) that the pensioners were entitled to accumulated deficiencies in payments since Jan. 1, 1937, and these were supposed to total \$3,000,000 or over.

A petition for the repeal of the pension was circulated and gained the needful number of names to put the proposal for repeal on the ballot. The proposal was defeated in the November election.

The State's position as to water rights and water development for electricity and irrigation was affected by a compact of Colorado, New Mexico, and Texas, consenting to the removal of the Federal prohibition of reservoirs in the Rio Grande; the compact, signed by the Governors of these States, awaited ratification by their Legislatures. The commencement of work on the Colorado-Big Thompson project about July 1 was announced; a contract binding prospective users of the water to repay a share of the cost was approved by special vote in districts of northern Colorado (June 29). The Big Thompson Highway, a \$1,800,000 road giving a new access to the Rocky Mountain National Park, was opened with a three-day celebration at the end of May. U.S. Route 40, carried across the Great Divide at Berthoud Pass, 11,315 ft. above sea-level, was opened with ceremonies on July 2. It was stated to be the most elevated transcontinental highway.

A public examiner's report of excessive cost in the operation of the State Industrial School at Golden led Governor Ammons to take steps for the reorganization of this institution. The Denver Medical Society voted (August 16) to sponsor a plan for giving medical attention to groups of persons of low income, at small charge, prepaid, in the Denver area. The discovery of platinum-bearing ores in paying quantity in an area of Southwestern Colorado was announced (May 16) by the U.S. Geological Survey.

Elections. U.S. Senator Alva B. Adams (Dem.) was re-elected, defeating Archibald A. Lee (Rep.) by nearly 3 to 2. Ralph L. Carr (Rep.) gained the Governorship from Gov. Teller Ammons (Dem.), who sought re-election.

Officers. Colorado's chief officers, serving in 1938, were: Governor, Teller Ammons (Dem.); Lieutenant-Governor, Frank J. Hayes; Secretary of State, George E. Saunders; Auditor, Thomas Annear; Treasurer, Homer F. Bedford; Attorney-General, Byron G. Rogers; Superintendent of Public Instruction, Inez Johnson Lewis.

Judiciary. Supreme Court: Chief Justice, Haslett P. Burke; Judges, E. V. Holland, Benjamin C. Hilliard, Francis E. Bouck, John C. Young, Norris C. Bakke, William Lee Knous.

COLORADO, UNIVERSITY OF. A coeducational State institution of higher learning in Boulder, Colo., founded in 1876. The number of students enrolled for the autumn of 1938 was 4125; the summer session enrollment was 4275. There were 288 faculty members. The total income for the year was \$2,131,512. The library contained 282,933 bound volumes, 17,000 pamphlets, and 3525 maps. An engineering building and two wings to the Arts and Sciences building were completed at a cost of \$475,000. President, George Norlin, Ph.D., LL.D., Litt.D., L.H.D.

AQUEDUCTS; ELECTRICAL INDUSTRIES; ELECTRICAL TRANSMISSION AND DISTRIBUTION; TUNNELS, WATERWORKS AND WATER PURIFICATION.

COLUMBIA UNIVERSITY. A nonsectarian institution for the higher education of men and women in New York City, founded as King's College in 1754. At Morningside Heights, Broadway, and 116th Street are located: Columbia College (for undergraduate men); Barnard College (for undergraduate women); Teachers College, including the Advanced School of Education; the professional schools of law, engineering, architecture, journalism, business, library service, and optometry; and nonprofessional graduate faculties of political science, philosophy, and pure science. The College of Physicians and Surgeons and the School of Dental and Oral Surgery are at the Medical Center on West 168th Street, the College of Pharmacy on West 68th Street, Bard College at Annandale-on-Hudson, N. Y., and the New York Post-Graduate Medical School on East 20th Street. In addition, through university extension classes and the summer session, courses are offered for resident students at Morningside Heights; and other courses are offered at Camp Columbia, as well as at several centers.

On the basis of the enrollment on Nov. 1, 1938, the total number of resident students for the year was estimated at 32,619, distributed as follows: Undergraduates, 3131, of whom 1803 were in Columbia College, 986 in Barnard College, 142 in Bard College, and 169 in other schools; and graduate students, 2787. The distribution of professional students was as follows: Law, 533; medicine, 539; engineering, 246; architecture, 62; journalism, 61; business, 541; dental and oral surgery, 289; pharmacy, 366; optometry, 99; library service, 420; and Teachers College, 8180; 5803 students were enrolled in university extension classes and 290 were unclassified. Of the 2968 nonresident students, 70 were registered in home study courses and 2898 in special and extramural courses. There were 11,822 students registered for the summer session of 1938. The grand total of resident students is exclusive of 2314 duplicate registrations.

The faculty and officers of administration in 1938-39 numbered 3682, of whom all but 88 were in active service. This number was distributed as follows: Professors, 415; associate professors, 228; assistant professors, 371; associates, 378; instructors, 557; lecturers, 170; assistants, 398; curators, 6; associates, instructors, lecturers, and assistants in Teachers College, 229; associates, instructors, lecturers, and assistants in the College of Pharmacy, 17; associates, instructors, and lecturers in Bard College, 20; instructors in extension and home study, not included above, 518; instructors in summer session, not included above, 463; officers of administration, 90; emeritus and retired officers, 88.

During the year 1937-38 the university received gifts in money representing a total of \$1,971,253. The principal gifts were: \$200,000 from the Commonwealth Fund and \$180,000 from the Martha M. Hall Foundation toward the cost of construction and equipment of the laboratory building at the Medical Center for graduate work in medicine; \$162,097 from the estate of William R. Shepherd for the Shepherd Foundation; \$150,000 from the Carnegie Corporation for the endowment of a professorship in the School of Library Service and \$75,000 for the establishment of the Andrew Carnegie Fund for the support of the School of Library Service; \$145,365 from the Rockefeller Found-

dation for research work; \$135,302 from the estate of Ellen C. Harris for the Harris Fund; \$129,984 from an anonymous donor to establish the Legislative Drafting Research Fund.

The capital endowment of the university in 1938, excluding value of plant (including Barnard College, Teachers College, College of Pharmacy, Bard College, and New York Post-Graduate Medical School), was \$86,980,474. The estimated total resources as of June 30, 1938, were \$155,868,638. The annual budget for 1938-39 was \$11,148,859. The library contained 1,615,000 volumes. COMMUNISM. The international Communist movement registered some gains during 1938 by taking full advantage of the virtually unlimited opportunities for propaganda offered by the worldwide fear of fascism, the failure of the democratic governments to resist the Fascist advance, and the persistence of large-scale unemployment in many capitalist countries. The growth of communism was encouraged in China not only by Japanese aggression but by the forced withdrawal of the German military advisers to the Nationalist (Kuomintang) Armies and the cutting off of Chinese munitions imports through Hong Kong. These developments forced the Nationalist Government to rely increasingly upon Soviet military assistance and consequently to relax its restrictions upon Communist propaganda. In the United States, Mexico, and some other countries the Communists made progress in boring from within liberal, pacifist, and anti-imperialist organizations and movements. But these gains were small compared with the setbacks administered to revolutionary Marxism during the year.

Position of the Soviet Union. The international position of the Soviet Union was gravely weakened by the continuance of fratricidal strife among Communist factions. The most sensational of the series of treason trials held in Moscow ended with the execution on March 15 of 18 anti-Stalin Communists, including several leaders of the Bolshevik revolution and builders of the Soviet state. Drastic purges of other anti-Stalin elements were reported from time to time. In 1937 most of the outstanding leaders of the Red Army were shot. In 1938 it was the turn of the Navy. Admiral Orlov, the commander-in-chief, and many other admirals and naval experts were executed or imprisoned (see **UNION OF SOVIET SOCIALIST REPUBLICS** under *History*).

These developments not only disillusioned many Communists and Communist sympathizers in other countries but gravely weakened the confidence of the Czecho-Slovaks and French in the value of their military alliances with the Soviet Union. This feeling, together with the fear among British and French conservatives of the spread of communism during another European war, was a major factor in the Anglo-French capitulation to Hitler and Mussolini at Munich on September 29-30. That capitulation eliminated Czecho-Slovakia as a valuable military ally of the Soviet Union and placed the Franco-Soviet alliance in jeopardy. It stimulated Nazism throughout Central and Southern

Europe. From his refuge near Mexico City, Trotsky declared that "the collapse of Czecho-Slovakia was the collapse of Stalin's international policy of the last five years."

That policy had consisted of suspending the Communist program of world revolution in order to enlist the aid of democratic and liberal forces in the world-wide fight against advancing fascism. The failure of this policy was indicated not only by Munich but by the collapse of the Popular Front in France and the formation of an anti-Communist government under Premier Daladier. In Great Britain, the United States, and most other democratic countries, with the exception of Chile, liberal and radical non-Communist groups persisted in rejecting Communist proposals for unity against "fascism." The general council of the International Federation of Trade Unions at Oslo, Norway, on May 19 rejected, 16 to 4, the conditions laid down by Soviet trade unions for affiliation with the federation. It contended that such an affiliation would be inconsistent with democracy. On November 18 all Communist candidates for election to the executive committee of the French General Confederation of Labor were defeated.

Communist Policy Changed. As though recognizing the truth of Trotsky's dictum, the Stalin regime during 1938 modified the world policies of the Third (Communist) International. At the 1935 Congress of the Third International, a united front of Communists and liberals against war and fascism was adopted as the "party line." In February of 1938 Stalin declared that the survival of Marxian socialism in the Soviet Union could be guaranteed against intervention from capitalist powers only through the aid of the proletariat in capitalist countries. By implication he called for the elimination of all bourgeois elements from the united front movements.

On June 25 President Mikhail Kalinin revived the old slogan of "world revolution" in a speech at Leningrad. "Our enemy is the capitalist world," he said. "We live not only in order to live but we live for the future, for a complete victory of communism throughout the world." After the Munich settlement, correspondents in Moscow reported a revival of the activities of the Third International directed toward the eventual overthrow of bourgeois governments everywhere. In November the Russian Communist party initiated a momentous change in the Marxian doctrine that the state would "wither away" after the establishment of communism. Propaganda instructions issued to party members declared that the existing all-inclusive state apparatus, including a strong professional army and police force, must be retained until Marxian socialism triumphed in the principal capitalist countries.

Communism in United States. At the Communist National Party Builders' Congress held in New York City February 18-22, William Z. Foster, national chairman, reported a gain of 22,000 members for the party, half of the new members being from A. F. of L. and C.I.O. labor unions. One-third of them were women and 15 per cent were Negroes, he said. Yet in May the total dues-paying membership of the party in the United States was reported at only 75,000. At the 10th annual convention of the New York State branch of the Communist party in New York City, May 19-23, a gain in membership from 15,814 in 1937 to 30,000 was announced. During 1937 the State organization spent \$120,000, including \$20,000 for "educational and organizational work," while its income was \$94,242. A full slate of candidates for

State and Congressional offices was named with the understanding that they might be withdrawn "in the interests of united progressive candidacies."

While Communist international strategy, as laid down by the Stalin regime in the Soviet Union, was beginning to shift from the Communist-liberal united front program, the American Communist party's national convention held in New York at the end of May sought to bolster the united front movement. "As a direct answer to those reactionary Tory attacks which attempt to characterize the Communist party as undemocratic," the party's central executive committee drafted a new pledge to be taken by all American Communists. The pledge, which was inserted in the new party constitution, follows:

I pledge firm loyalty to the best interests of the working class and full devotion to all progressive movements of the people. I pledge to work actively for the preservation and extension of democracy and peace, for the defeat of fascism and all forms of national oppression and for the establishment of socialism. For this purpose I solemnly pledge to remain true to the principles of the Communist party and to maintain its unity of purpose and action and to work to the best of my ability to fulfill its program.

The constitution provided that "individual party members enjoy unrestricted rights of discussion in pre-convention periods," but declared that "decisions of the convention shall be final." It also required members of the party to become citizens of the United States. The concluding session of the convention was featured by demands of Communist leaders for a united front of all "democratic and progressive forces" to defeat the "reactionaries." In furtherance of this program, subsequent efforts were made to establish co-operation with various non-Communist groups, including the Catholics. These efforts met with scant success.

Communist Political Strategy. On September 5 Earl Browder, national executive secretary of the party, declared Communists were obligated to support President Roosevelt and the New Deal in the November elections. In October the Communist party in New York State withdrew all its nominees and announced that it would support the State-wide candidates of the American Labor party, which had endorsed the Democratic candidates for Governor and Lieutenant Governor. The American Labor party and the Democratic nominees for Governor and Lieutenant Governor all rejected the Communist endorsement. In reply to inquiries from the New York State commander of the American Legion, both the Democratic and Republican gubernatorial candidates in that State pledged themselves not to appoint Communists to public office if elected. In spite of these rebuffs, the Communists voted for the Democratic and American Labor party candidates. On November 9 Browder asserted that "the Communist vote in New York State represented the difference between victory and defeat for the Democratic forces on election day."

Investigations of Communism. Fairly exhaustive inquiries into the activities of the Communist party in the United States were made during the year by a New York State joint legislative investigation committee headed by Senator John J. McNaboe, and by the U.S. House Committee Investigating un-American Activities, of which Representative Martin Dies of Texas was chairman. Earl Browder testified before the McNaboe committee on June 30 and July 1. He said that the American Communist party was affiliated with the Third International (Comintern) but asserted the decisions of the Comintern were binding in the

United States only when approved by the American party. He admitted, however, that his party had never vetoed a decision of the Third International. He testified that Communist newspapers and propagandist literature "penetrate almost everywhere in America," but denied that there was "any Communist conspiracy to overthrow the United States by violence." Under questioning, he testified that he would "fight for the United States" in case of a United States-Russian war. Other witnesses before the committee testified to strong Communist influence in the Workers Alliance and in the New York units of the Federal Writers Project.

Before the Dies Committee, John P. Frey, vice-president of the A. F. of L., testified that a meeting of leading American Communists in New York in May decided to broaden the Communist movement by action within the major political parties, by pressure on President Roosevelt to force him farther to the Left, and by supporting Governor Earle of Pennsylvania.

Sensational testimony was given by James B. Matthews of Washington, N. J., an organizer and former president of the American League Against War and Fascism, which he described as a Communist-inspired "united front" organization. The name of the organization was later changed to the American League for Peace and Democracy. He said that the major aims of the Communist program in America were the disruption of the Democratic party, the control of labor unions, and the installation in responsible governmental positions of Communists or their sympathizers. Communist party circles, he continued, boasted that the party had "its friends and sympathizers situated strategically in every important institution in this country—government agencies, newspapers, magazines, the churches, women's clubs, trade unions, universities and colleges, and in industry." He declared peace, job security, and civil liberties were "temporary ideas and ideals which the Communist party utilizes for its objective of bringing about class war, almost universal insecurity, and the complete abolition of civil liberties."

Matthews said the four types of individuals making up the Communist united front were (1) the Communist party members, who "invariably occupy strategic positions of control," (2) "the fellow travelers, who as a rule go along as faithfully as if they were actually party members," (3) the "stooges,"—"persons of prominence whose names have considerable publicity value . . . and do the work of covering up the Communist control of the united front," and (4) the "innocents" who are "supposed to make up the overwhelming number of the adherents to the united front." The witness described their functions as follows:

The chief object of the united front is to draw the innocents gradually closer and closer to the Communist party until they are at last completely under its influence. The party members do most of the hard work. The fellow travelers are the go-betweens who bring the Communist world and the capitalist world together. The stooges are the necessary camouflage for the united front manoeuvre. The innocents are the fodder for revolution, although some of them are prospective party members as well.

Matthews testified that the Communists had made little progress in "boring from within" A. F. of L. unions but much more in C.I.O. unions; that Communists were planted in strategic factories and industries to sabotage vital processes in case of war with the Soviet Union; that the "first and only loyalty" of the American League Against War and Fascism was to the Soviet Union; and that the Communist party relies heavily upon the careless-

ness or indifference of prominent non-Communist citizens in lending their names to its propaganda purposes.

Other witnesses before the Dies Committee included a number of former Communists, who described the party's activities in various WPA projects, in provoking disorders in Jersey City, in raising funds and volunteers for the Spanish Loyalists, and in directing the agitations of the Workers Alliance and other "united front" organizations. Investigators for the committee and labor leaders testified that many of the sit-down strikes in Michigan and other States in 1937 were instigated by Communists.

According to Frederick R. Barkley of the *New York Times* "the general conclusion" in Washington was that the Dies Committee hearings "indicated existence of an active Nazi-Fascist movement which is not having much success, but which might be dangerous in wartime, and a much more extensive and successful Communist infiltration into labor unions and many other agencies." On November 27 Representative Dies requested Secretary of State Hull to prosecute the American Communist party and certain other Communist and Fascist organizations for failure to comply with the law of June 8, 1938, requiring registration at the State Department by agents of foreign principals. Among the Communist united front organizations which he suggested be investigated in connection with this law were the Workers' International Relief, Friends of the Soviet Union, North American Committee to Aid Spanish Democracy, International Workers' Order, American Student Union, Young Communist League, and Young Pioneers of America.

Communism in Labor Movement. The struggle to purge the United Automobile Workers Union and certain other C.I.O. unions of Communist influence continued during 1938. In June Homer Martin, president of the U.A.W.U., suspended five of its officers for "disruptive tactics" in connection with alleged efforts of the Communist party to seize control of the union. Later the four suspended officers were restored to their posts by a C.I.O. mediatory committee and the union's executive board ordered Martin to purge his staff of "Lovestone" Communists, bitter enemies of the orthodox Stalinist Communist party. On November 19 the U.A.W.U. executive board voted to abolish the Detroit District Council, which Martin had accused of being under Communist domination.

A group of alleged Communists, led by Harry Bridges, West Coast maritime union leader, pressed for a Leftist policy at the convention of the Committee for Industrial Organization in Pittsburgh in November, but were checked by the opposition of John L. Lewis. It was reported on December 30 that three members of the faculty of Teachers College, Columbia University, had resigned from the American Federation of Teachers on the ground that the New York City locals of the union were dominated by the Stalinist wing of the Communist movement.

COMMUNITY CHESTS AND COUNCILS, INC. An association organized in February, 1918, when only 21 cities were using the centralized method of raising philanthropic and charitable funds. It was first known as the American Associa-

tion for Community Organization, a name which it continued to bear until 1927, when the name was changed to the Association of Community Chests and Councils. In 1933 the association was incorporated, and adopted its present name. The Association staff is guided by an Advisory Committee of local chest and council executives in carrying out the policies decided upon by the Board of Directors. The association is financed by dues from its corporate members.

The purpose of Community Chests and Councils is to aid and assist local community chests in their efforts to raise, manage, and dispose of money for social welfare purposes; to encourage and stimulate collective community planning for social welfare, and the development of better standards for community organization, as well as to harmonize and make more efficient the work of all social welfare organizations; to co-operate with nation-wide and other organizations in joint efforts to promote social welfare; to exercise other functions in connection with the achievement of all these purposes.

The Mobilization for Human Needs is a program of national information regarding the social needs of the times, urging citizens to support their local private welfare appeals. It is sponsored by a National Citizens' Committee of public-spirited men and women.

Thirty-six national organizations for social welfare and health co-operate in this effort, with Community Chests and Councils, Inc., acting as administrative agency. The Mobilization for Human Needs arranges public meetings of national significance, secures the donation of nation-wide radio time, and stimulates the publication of articles and editorials in magazines and newspapers. It does not raise a national fund, but throws its strength to local campaigns of chests and welfare funds.

The 25th anniversary of the beginning of the modern chest movement in Cleveland in 1913 was celebrated during 1938.

Of the 484 chests in operation, 469 are in the United States proper, 2 in the territory of Hawaii, and 13 in Canada and other foreign countries. All but six cities of 100,000 population and over in the United States have community chests. Nine million contributors in 475 cities gave \$83,871,576 to community chests to be used for private social work in their communities during 1938.

The officers in 1938-39 were: Honorary and acting president, George E. Vincent, Greenwich, Conn.; vice-presidents, John Stewart Bryan, Richmond, Va., and Geoffrey Smith, Philadelphia, Pa.; treasurer, J. Herbert Case, Plainfield, N. J.; secretary, Pierce Atwater, St. Paul, Minn.; executive vice-president, Allen T. Burns. Headquarters, 155 East 44th St., New York City.

CONGO, BELGIAN. A Belgian colony in Central Africa. Area, estimated at 909,654 square miles; population (Jan. 1, 1937, estimate), 10,066,834, including 20,103 Europeans. The chief towns are Léopoldville (capital), Matadi, Elisabethville, Jadotville, Stanleyville, Coquilhatville. In 1937 the 4270 schools had 208,088 pupils.

Production and Trade. The main products were copper (150,000 metric tons in 1937), cottonseed (68,300 metric tons in 1936), palm oil, palm kernels, woods, cotton, copal gum, coffee, sugar,

tin, corn, zinc, groundnuts, cacao, jute, rice, gold (12,873 kilograms), diamonds, and radium. Cattle thrive only in the districts free from tsetse flies, especially the highlands of Ituri, Katanga, and Kivu. In 1937 imports were valued at 1,137,091,689 francs; exports, 2,486,905,485 francs (5 paper francs were equal to 1 belga which averaged \$0.1688 for 1937).

Communications. The river Congo and its tributaries form an important means of communication. There were 38,010 miles of roads in 1937. During 1938 an international highway was under construction, between Ngdinga and Maquela-Dozombo, to connect the Belgian Congo with Angola. It was announced on Aug. 8, 1938, that the last section of the Congo automobile road forming part of the Cape-to-Cairo route had been finished. Regularly operated air lines extended over 3694 miles in 1938.

Government. Budget estimates for 1938 indicated revenue of 662,800,000 francs, extraordinary receipts from the lottery loan and from the Belgian government were estimated at 104,181,000 francs; expenditure, 766,981,000 francs. The colony is administered by the Minister of the Colonies at Brussels, aided by a colonial council of 14 members (8 appointed by the King, 3 chosen by the senate, and 3 by the chamber of representatives). A governor-general represents the King in the colony. Governor-General, Pierre Ryckmans (appointed, December, 1934).

Ruanda-Urundi, rōō-an'dā ōō-rōon'dé. Two districts (formerly in German East Africa) mandated to Belgium by the League of Nations. Area, 20,535 square miles; population (1936 estimate), 3,509,094, of whom 932 were Europeans. Capital, Usumbura. Livestock raising is the principal occupation of the people. The production of chief crops, in 1936-37, in metric tons, was: Maize, 37,500; potatoes, 121,000; groundnuts, 1400. In 1936 gold production totaled 422 kilograms. In 1937 the estimated value of imports, including bullion and specie (in old U.S. gold dollars) was \$1,400,000 (1936, \$1,200,000); exports, \$1,800,000 (1936, \$1,500,000). In 1937 there were 1326 miles of national and 2065 miles of local roads. For 1938 ordinary and extraordinary revenue was estimated at 45,859,300 francs; ordinary expenditure, 41,950,400 francs. According to the law of Aug. 21, 1925, both districts were united, for administrative purposes, with the Belgian Congo and placed under the supervision of a vice-governor.

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGREGATIONAL AND CHRISTIAN CHURCHES. THE GENERAL COUNCIL OF THE. A general council was instituted at Seattle, Wash., June 26, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. For the early history of these churches consult THE NEW INTERNATIONAL ENCYCLOPÆDIA, vol. v, pp. 285 and 737 ff. and THE NEW INTERNATIONAL YEAR BOOK for 1932.

The officers elected at the biennium in June, 1938, were: Moderator, Rev. Oscar E. Maurer, New Haven, Conn.; assistant moderators, Mr. John V. Sees, Lawrence, Kans., Rev. Rockwell H. Potter, Hartford, Conn., Rev. Hugh Elmer Brown, Evanston, Ill.; secretary emeritus, Rev. Charles E. Burton, Forest Hills, N. Y.; minister and secretary, Rev. Douglas Horton, New York, N. Y.; associate secretary, Rev. Frederick L. Fagley, New

York, N. Y.; assistant secretary, Rev. Warren H. Denison, Dayton, Ohio; treasurer, Mr. Arthur Y. Meeker, Montclair, N. J.

Statistics for the Congregational and Christian churches as of Jan. 1, 1938, showed 6109 churches, 5847 ministers, and a church membership of 1,030,914. There were 3412 young people's societies, with a membership of 208,559. The Sunday School enrollment was 650,862. The total raised for all benevolences was \$2,186,428; and the home expenses of the churches were \$14,534,449.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in the United States, having been organized June 29, 1810. On Jan. 1, 1938, there were 13 missions under 8 different flags. The missionaries holding life appointments numbered 429 and included 95 ordained men, 49 unordained men, 139 wives, 146 single women. There were also 38 associates serving for shorter periods, bringing the total number of missionaries up to 467, while native workers numbered 6608. The places of service numbered 2813. The organized churches numbered 765 with 107,596 communicants. The total Christian community numbered 369,031; Sunday Schools, 1304. There were 31 theological seminaries and training schools with 2193 students; 10 colleges with 4255 students; 61 secondary schools and 956 primary schools and 10 industrial and vocational schools with a total enrollment of 92,706 pupils. There were 23 hospitals and 40 dispensaries with a staff of 35 physicians and 21 foreign nurses.

At the biennial meeting of the Council in 1936 action was taken authorizing the unification of the work of the national societies under a single corporation. Under the name of the Board of Home Missions of the Congregational and Christian Churches it has taken over the work heretofore done by the Church Extension Boards, the American Missionary Association, the Congregational Education Society, the Congregational Publishing Society, and the Board of Ministerial Relief. During 1937-38 this organization helped to maintain 372 home missionary workers serving 470 churches. Grants and loans for church buildings and parsonages were made to the amount of \$339,833.79. The 13 schools maintained had 4121 pupils enrolled. Of these 8 were Negro schools, 5 were Negro colleges, 1 was in the Southern highlands, and 1 in Puerto Rico. Local churches were given assistance in meeting their educational problems through departments of Young People's Work, Children's Work, World Fellowship, and Leadership Education. Ministerial relief was given to 745 ministers, widows, and orphans, the average grant to a minister being \$244 and to a widow \$198. The total expenditures were \$1,251,144.38, of which \$332,901.95 came from current giving and the remainder from endowment and other sources.

The headquarters of the General Council of the Congregational and Christian Churches are at 287 Fourth Avenue, New York City. Those of the Board of Home Missions at the same address, with offices also at 14 Beacon St., Boston, Mass., and those of the American Board at 14 Beacon St., Boston, Mass.

CONGRESS. See UNITED STATES.

CONGRESS OF INDUSTRIAL ORGANIZATIONS. See LABOR UNIONS.

CONNECTICUT. Area and Population. Area, 4965 square miles; included (1930) water, 145 square miles. Population: Apr. 1, 1930 (census), 1,606,903; July 1, 1937 (Federal estimate), 1,741,000; 1920 (census), 1,380,631. Hartford, the

capital, had (1930) 164,072 inhabitants; New Haven, 162,655.

Agriculture. The accompanying table shows the acreage, production, and value of the principal crops of Connecticut for 1938 and 1937.

Crop	Year	Acreage	Prod. Bu.	Value
Hay (tame)	1938	341,000	516,000	\$7,792,000
	1937	335,000	484,000	6,824,000
Tobacco	1938	16,500	16,726,000	8,843,000
	1937	17,400	21,920,000	7,504,000
Potatoes	1938	16,500	2,310,000	1,848,000
	1937	17,000	2,890,000	1,994,000
Corn	1938	49,000	1,764,000	1,200,000
	1937	51,000	1,989,000	1,671,000
Apples	1938	1,659,000	1,659,000
	1937	2,122,000	2,249,000

* Tons. ♢ Pounds.

Finance. Connecticut's State expenditures in the year ended June 30, 1937, as reported by the U.S. Bureau of the Census, were: For maintaining and operating governmental departments, \$40,662,994 (of which \$11,753,676 was for highways, and \$1,857,028 was for local education); for interest on debt, \$291,238; for capital outlay, \$4,963,549. Revenues were \$58,826,576. Of these, property taxes furnished \$1,780,530; sales taxes, \$14,152,174 (including tax on gasoline, \$8,935,399); departmental earnings, \$3,388,762; inheritance taxes, \$3,285,163; sale of licenses, \$13,781,544; unemployment compensation, \$9,403,661; Federal or other grants-in-aid, \$6,573,926. The gross debt outstanding on June 30, 1937, totaled \$4,902,769; all of it but \$1100 was floating debt. On an assessed valuation of \$2,978,739,711 the State levied in the year ad valorem taxes of \$1,630,288.

Education. Inhabitants of school age were accounted, for the year ended June 30, 1938, as 328,806, from 4 to 16 years of age. Those enrolled in public schools totaled 302,970; this comprised 16,626 in kindergartens, 186,958 in elementary schools, 25,444 in junior high schools, and 73,942 in high schools. The year's expenditures for public-school education totaled \$31,177,079. While enrollments fell nearly 3 per cent short of the total for the year before, expenditures showed a moderate rise. This rise conformed with a somewhat higher level of salaries for teachers. Their pay averaged, for the year, \$1608 in kindergartens, \$1535 in elementary positions, \$1929 in junior high schools, and \$2074 in high schools. The Connecticut State Teachers' Association advocated a plan of teachers' tenure, for enactment by the Legislature in 1939.

Charities and Corrections. The State's central authority over the administration of the majority of its institutions for the care and custody of persons was exercised by the Public Welfare Council (a board of five members) and a Commissioner of Welfare. It supervised 10 institutions. These and the numbers of their respective inmates on June 30 were: The State Prison, at Wethersfield, and Osborn Prison Farm, at Enfield, 753 for both; State Farm for Women, Niantic, 206; Connecticut School for Boys (delinquent), Meriden, 283; Long Lane Farm (delinquent girls), Middletown, 188; Connecticut Reformatory, Cheshire, 331; State hospitals for mental illness, at Middletown, 3214; Norwich, 3028; and Newtown, 983; Mansfield State Training School and Hospital (mental defectives), Mansfield, 1192; Mystic Oral School, Mystic, 113; and Fitch's Home for Soldiers, Noroton, 592. The State's five sanatoria for tuberculosis, governed by a Tuberculosis Commission, had 1271 patients. The total of persons kept in all these institutions was 12,154.

Political and Other Events. The New England hurricane, striking the coast to the northeast of Long Island on September 21, devastated it from Martha's Vineyard as far west as New London. The coastal communities in Connecticut's part of this area suffered severely. In New London many buildings were wholly or partly demolished, and fire, starting among ruined buildings, swept away an entire block. Small vessels near the city's waterfront were cast ashore. Damage to property in New London was said to exceed \$4,000,000, including \$1,000,000 by fire. The tidal waters, driven to an unusual height by the wind, increased the ruin caused by the wind itself. Loss of life in the State, said to total about 100, included fatalities in and about Stonington. Wall Street in Stonington was reported to have lost all the fishermen's dwellings that lined it, with apparently considerable loss of life among the occupants. The eastern part of the State in general lacked transportation and electricity for a time after the storm, railroads, highways, and electric transmission having been put out of service. Airplanes dropped supplies of food on Norwich, which could not be reached otherwise. In the valley of the Connecticut River, while the damage from wind was secondary, low-lying areas were flooded, chiefly because of heavy rains that had fallen some days in advance of the gale. About 2000 persons were driven from their homes by water in East Hartford and other communities near Hartford. Railroad service east of New Haven was suspended for several days. The loss to property in the State was thought to approximate \$30,000,000.

The Federal Government, apparently to escape the New England States' objection to altering their compact for works to prevent floods in the chief river valleys, made preparations to proceed with such work entirely at its own expense, under the terms of a flood-control act of 1938, in Connecticut as elsewhere. This involved, within Connecticut, preliminaries to the building of protective works at Hartford and study of possible work on the Housatonic River. See CHILD LABOR.

The prosecution of the Mayor of Waterbury and 26 other persons, for conspiracy to defraud the city of sums in excess of \$1,000,000, was started in May, following an investigation.

Elections. The Republican candidates, retrieving the reverses of the election of 1936, gained almost all the chief offices. Raymond E. Baldwin (Rep.) was elected Governor by 227,572 votes (unofficial count), as against 225,659 for Governor Wilbur L. Cross (Dem.), who unsuccessfully sought a fifth successive term. Cross's defeat was attributed to an unusually great Socialist vote of 163,953 for Jasper McLevy, cast mainly in normally Democratic urban areas. John A. Danaher (Rep.) was elected U.S. Senator, defeating Senator Augustine Lonergan (Dem.) by a margin of about 20,000. Four Republicans and two Democrats were elected to the Federal House of Representatives.

Officers. The chief officers of the State, serving in 1938, were: Governor, Wilbur L. Cross (Dem.); Lieutenant-Governor, T. Frank Hayes; Secretary of State, C. John Satti; Treasurer, Guy B. Holt; Comptroller, Charles C. Swartz; Attorney-General, Charles J. McLaughlin; Commissioner of Education, Ernest W. Butterfield.

Judiciary. Supreme Court of Errors: Chief Justice, W. M. Maltbie; Associate Justices, George E. Hinman, Newell Jennings, Christopher L. Avery, Allyn L. Brown.

CONNECTICUT COLLEGE. A liberal college of arts and sciences for the higher education

of women in New London, Conn., chartered in 1911 by the State of Connecticut and opened for instruction in 1915. The enrollment for the autumn of 1938 was 737. The faculty numbered 74 full-time members. The productive funds amounted to \$1,329,031, and the budget for the year was \$727,879. There were 80,000 volumes in the library. In 1937-38 the college received miscellaneous gifts amounting to \$36,584. Buildings under construction during the year were: The Frank Loomis Palmer Auditorium, a bequest from the will of the late Virginia Palmer of New London, and the Harkness Chapel, a gift of Mrs. Edward S. Harkness of New York. In the fall of 1938, a small Nursery School for 12 children was opened, and a new major in Child Development was added to the curriculum. President, Katharine Blunt, Ph.D., LL.D.

CONSUMER INCOMES. See STATISTICS.

CO-OPERATION. Growth of the Co-operative Movement. In recent years there has been a decided increase in the popularity of consumer co-operation, the years of the depression notably showing advances in the growth of societies. According to the U.S. Department of Labor, which had just completed a survey of the movement, the number of consumers' co-operative societies doubled between 1933 and 1936—from 188 to 3600 and from 328,278 members to 677,750 members. Reliable estimates placed the present number of members of such societies at close to a million in 1938. Consumers' co-operatives were particularly strong in Minnesota, Illinois, Nebraska, Iowa, Wisconsin, Kansas, and Michigan. They flourished notably in those regions where Scandinavian settlers located in America to bring with them the long and successful tradition of co-operation in their native lands.

The total volume of business in 1936 of such consumer co-operatives amounted to 182 millions of dollars. According to the Bureau of Labor Statistics, the growth of co-operation was "a record of slow, quiet expansion." It was generally being agreed that the foundation of the co-operative movement in this country rested upon a firm structure, in view of the fact that nearly half of the co-operatives were associated with agriculture. Consumers' co-operation had the support of agricultural societies in America as early as the establishment of the National Grange in the 1870's. It is to be noted also that agricultural co-operation was extended into other fields, including the sale of farm products, purchase of farm supplies, the establishment of insurance societies, etc. In recent years, also, co-operation was receiving the active support of populations from other sectors. In towns and cities white-collar groups and labor unions were carrying on active educational campaigns and co-operative stores were springing up in most of the great urban communities of the country. Also, it is to be noted that the New Deal administrations were actively promoting the co-operative movement. The Federal government sponsored construction of rural electric lines, was experimenting with co-operative communities for marginal farmers, and was supporting co-operative stores in the green-belt towns which the Resettlement Administration had established.

Nevertheless, there was reason to assume that the co-operative movement in America would never take on the large-scale proportions which it at-

tained in the Scandinavian countries and in England and Scotland. Attention must be called to the existence of chain stores and mail-order establishments in this country, which, because of mass purchases and sometimes independent manufacturing, were able to compete successfully and sometimes sell at lower prices than retail establishments purchasing their wares in the open market. In the second place, it should be noted too that the success of co-operation was closely linked with the profound educational conditioning, in view of the fact that the savings afforded members were not very large. In other words, identification with the movement was not on the basis of material gains but on the basis of a psychology that linked co-operation with trade unionism and perhaps as well with an idealistic, non-capitalist society. It has been estimated that savings of a successful co-operative ranged up to only 5 per cent for general purchases and 8 per cent for gasoline and oil. Also, co-operatives must struggle with the same problems which affect private business. The factors of inefficiency, insufficient capital, sudden price declines, and the like, tended to make co-operation somewhat precarious. Private business, while generally opposed to co-operatives, had not yet become greatly alarmed over the movement's growth. The U.S. Chamber of Commerce believed that private business could meet the challenge of the co-operatives through more efficient operations and more direct services. It pointed out that retail business in the United States amounted to 30 billion dollars a year, of which the co-operative movement was responsible for only 200 million dollars. Organized business, however, was opposed to government assistance to the co-operative movement. The tables

TABLE I.—ESTIMATED NUMBER, MEMBERSHIP, AND BUSINESS OF CONSUMERS' CO-OPERATIVES, 1936

Type of association	Number of associations	Number of members	Amount of business
<i>Local associations</i>		<i>Individuals</i>	
Retail distributive associations	3,600	677,750	\$182,685,000
Stores and buying clubs	2,400	330,500	107,250,000

Co-operative Wholesale Associations. Co-operative wholesaling was also firmly established in the United States. At the end of 1936 there were in operation 20 regional wholesales with a trading area of one or more States, dealing in consumers' goods. In addition, there were 2 interregional wholesales formed by the regional wholesales and 9 federations of less than State-wide scope and specializing in certain commodities. The 20 regional wholesales were serving more than 1700 member associations and over 600 other co-operatives were making wholesale purchases from them, though not affiliated. A wholesale business in excess of \$40,000,000 was reported by the regional co-operatives, a gain of 24.2 per cent over 1935. Its associations had sales of more than \$3,000,000 each and 3 of these had sales of over \$5,000,000. Increases were also shown in net earnings and refunds made on members' patronage. These societies also reported share capital of nearly \$2,000,000, total assets of nearly \$6,000,000, and net worth in excess of \$3,500,000.

Credit Unions. The credit unions of the United States in 1937 showed substantial increases in membership and assets over previous years. There existed in the country something more than 6000 such societies for which statistical data were available for 5231. These indicated a combined membership of over 1¼ million persons and total assets of more than 100 million dollars. Examination of data for individual States over a period of years indicated that in industrial States like Massachusetts, New Hampshire, New York, and Rhode Island, where credit unions had a long history, the associations showed a drop in membership and in assets early in the depression. However, the year 1934 revealed an upturn which continued throughout 1937. In most of the newer credit-union States, irrespective of whether industrial or agricultural, both membership and resources showed a continuous rise year after year all through the depression and up to the end of 1937. Among the important credit-union States in which this took place were Illinois, Iowa, Michigan, Minnesota, Missouri, Nebraska, and Wisconsin. During the year 1937 the credit unions for which statistical data were available made loans totaling \$71,344,000. Also, the total loans outstanding at the end of the year came to \$77,217,000.

Co-operative Purchasing by Farmers. In 1937 the 12 banks for co-operatives under the Farm Credit Administration made the first door-to-door count of the operations of farmers' co-operatives in the country. The data obtained covered the year

and their business for 1936 amounted to \$2,700,000,000. On this business they realized net gains of \$38,686,000, of which \$25,380,000 was returned to the members on their patronage. It was found that the largest amount of patronage refunds was made by the citrus-fruit marketing co-operatives, which returned a total of \$6,043,000. The associations dealing in petroleum products were also great money savers for their members; 3 of every 4 returned patronage refunds—totaling altogether \$4,294,000 and averaging some \$7 per member.

As a result of a survey covering 3000 farms in January, 1938, the Bureau of the Census reported that the proportion of farmers who were doing co-operative purchasing of their supplies was 17 per cent. Of those surveyed in 1930 less than 7 per cent were in this class. It is interesting to note that tenant farmers showed a much greater increase in co-operative activity than did the farm owners. The proportion of the tenants buying co-operatively rose from 3.9 per cent in 1930 to 13.5 per cent in 1938, whereas the corresponding figures for owners were 9 per cent and 19.5 per cent. See AGRICULTURE.

Labor Banks. The four labor banks now in operation in the United States showed an increase of 14.4 per cent in capital, surplus, and undivided profits on June 30, 1938, as compared with the same date in 1937, but sustained a loss of 3.1 per cent in deposits and of 2.4 per cent in total resources. Compared with 1937, the Union National Bank had increases in both deposits and total resources, but the other three banks showed decreases in these items in 1938.

The following table, supplied by the Industrial Relations Section of Princeton University, shows data for each of the four banks.

TABLE III—CONDITION OF LABOR BANKS AS OF JUNE 30, 1938

Name and location of bank	Capital, surplus and undivided profits	Deposits	Resources
All banks	\$2,503,899	\$21,013,099	\$23,785,086
Amalgamated Trust & Savings Bank, Chicago, Ill.	650,000	7,056,297	7,804,243
Union National Bank, Newark, N. J.	469,743	3,443,320	3,927,852
Amalgamated Bank of New York, New York, N. Y.	681,580	5,893,029	6,698,733
Telegraphers' National Bank, St. Louis, Mo.	702,576	4,620,453	5,354,258

Producers' Co-operatives. Producers' co-operation in the United States continued at a very insignificant level. According to the survey made by the Bureau of Labor Statistics, there were 39 such associations in 1935, 20 in 1929, 18 in 1933, 24 in 1936, and 27 in 1937. In 1937 the total number of persons co-operatively employed in enterprises owned and operated by workers themselves was 2167. There were, in addition, 282 non-member employees. Approximately \$540,000 was paid in wages in 1936 by the associations reporting on this point. In 1936, with a share capital of \$853,000, a net worth of almost \$1,110,000, and business amounting to nearly \$3,000,000, there were aggregate net earnings of nearly \$70,000, or an average of \$5200 per association.

Various types of industry were carried on by workers' productive associations. The industries represented in the Bureau's study were cigar making, the manufacture of clothing (including shoes), shingles and lumber, canning and processing of food and fish, fisheries, printing and publishing, coal mining, sheet-metal works, sign painting, laundries, and handicraft production. Workers had undertaken productive enterprises from various motives. Unemployment in their own industry had been a frequent reason. In a number of cases they became unemployed because of the failure or the transfer to another locality of the plant in which they were employed, and in others because of an unsuccessful strike in which they were engaged. In some instances workers had been assisted by their trade-union in starting a co-operative productive business.

Unemployed miners formed societies to take over and work mines that had closed because they had proved unprofitable. Sign painters, when the firm by which they were employed went out of business, formed a co-operative to take up the business and carry it on. Other unemployed workers associated themselves for the production and marketing of various kinds of handicraft articles. Indians had been aided by the Government in forming associations for this purpose and for carrying on fisheries and fish canning and processing. A society for the manufacture of frozen fish and other products was formed by a group of fishermen and farmers as an outlet for their fish and farm products.

Lack of adequate capital was common among workers' productive enterprises and often meant the difference between success and failure in bad times. Other handicaps of associations of this type were business inexperience and lack of knowledge of salesmanship and of market conditions. A few societies, however, developed a high degree of business management. One society, which was started in 1919 by a few shoe workers, weathered the depression (although with deficits in some years), and had net earnings in 1935 and 1936; in the latter year it paid a 10 per cent dividend. It did a business of approximately a million dollars in 1936, in an industry which was highly competitive and subject to the fluctuations of fashion.

Over \$500,000 was paid in wages in 1936 by the 12 societies which reported on this point. The average annual earnings per employee in the different industries in 1936 ranged from \$258 to \$1406, the general average being \$902. How much part-time work was included in the employment for which these wages were paid was not reported. The fact that a 10-hour week was reported in one instance and a 3½-day week in another suggests that the low average earnings might be due in some meas-

ure to part-time or seasonal employment, especially of nonmember workers. Twelve societies reported that they paid union wages or more, and five that they did not pay the union scale. The other societies did not report on this point. The total and average wages paid in 1936 by workers' productive societies in the different kinds of business are shown in Table IV.

TABLE IV.—WAGES PAID BY WORKERS' PRODUCTIVE ASSOCIATIONS, 1936

Kind of business	Number of employees	Wages paid, 1936	
		Total	Average per employee
Total	597	\$538,237	\$ 902
Cigar factories	10	3,398	340
Clothing factories	119	65,862	553
Fish canning and processing	44	19,631	446
Food factories	100	140,646	1,406
Handicraft production	32	25,091	784
Printing and publishing	2	515	258
Sheet-metal works	7	8,225	1,175
Shingle mills	26	27,962	1,075
Shoe factories	257	246,907	961

COPELAND, ROYAL S (AMUEL). An American physician and Senator, died in Washington, D. C., June 17, 1938. Born in Dexter, Mich., Nov. 7, 1868, he attended the local schools, Michigan State College and the University of Michigan (M.D., 1889). Thereupon he became house surgeon in the University Hospital and assistant professor of ophthalmology and otology at the University during 1889-90, when he entered private practice in Bay City, Mich., and subsequently did postgraduate work abroad. In 1895 he was appointed professor of ophthalmology at the University of Michigan, where he remained until 1908, when he joined the staff of Flower Hospital and New York Homeopathic Medical College, New York, as professor of ophthalmology and dean. He remained there until 1918.

Dr. Copeland's first political ventures were as mayor of Ann Arbor, Mich., during 1901-03, to which he was elected on the Republican ticket, and as president of the Board of Education there in 1907-08. During the presidency of Grover Cleveland he was appointed a member of the U.S. Pension Examining Board. In 1910, Dr. Copeland received his first political appointment in New York City, when Mayor Gaynor named him to the ambulance board. His work at Flower Hospital brought him to the attention of Mayor Hylan and also to that of William Randolph Hearst. The former appointed him Commissioner of Public Health and President of the Board of Health of the City of New York in 1918, and the latter opened the columns of his newspapers to his syndicated medical writings.

Dr. Copeland served as health commissioner until 1923, and during his tenure he coped successfully with an influenza epidemic and promoted a campaign for increased milk consumption. In 1922 the political break between Alfred E. Smith and William Randolph Hearst brought Copeland the nomination for Senator. Little hope was held for his election, but his newspaper health articles and talks throughout the State had made him known to the voters and he was elected, being re-elected for the terms 1929-35 and 1935-41.

One of the hardest working senators on the floor and in committee, his parliamentary technique and astuteness in debate were acknowledged by his co-workers in the Senate. He opposed from the beginning any granting of independence to the Philippine Islands; supported soldiers' bonus leg-

islation; urged the repeal of the 18th Amendment, and at first supported the National Recovery Act. By 1934, however, he had earned the enmity of the "New Deal," and in 1936, although a delegate to the Democratic National Convention he did not attend, refusing to take part in the renomination of Franklin D. Roosevelt. Thereafter he voted against the Agricultural Administration Act, the Supreme Court Bill, the Reorganization Bill, and other important administration legislation.

The crowning achievement of his senatorial service was the new food and drug bill which became a law in June, 1938. From his first day in the Senate he had shown interest in such legislation, and the bill replacing the obsolete one of 1906 became a law only through his continued effort, and it might well be considered his monument. He was chairman of the Committee on Commerce and presided at weeks of hearings on a new maritime law and in 1937, at the National Maritime Observance Day exercises, was awarded the Nolan-Stirling Trophy for his services to the American Merchant Marine. Also, he acted as chairman of a subcommittee which wrote the La Follette bill establishing a Federal program for control of venereal diseases; was chairman of the Senate committee that investigated racketeering, and was chairman of the Senate conferees on the \$375,000,000 Flood Control Bill.

In July, 1938, the Senator entered the New York City campaign for mayor as a candidate in both the Democratic and Republican primaries. In the former he was the Tammany Hall candidate as opposed to the "New Deal" candidate, Jeremiah T. Mahoney; in the latter, he was entered as a Conservative to oppose Fiorello H. La Guardia. Defeated in both primaries, he returned to the Senate more militant than ever in his crusade against the administration.

Senator Copeland was a delegate to the Methodist Ecumenical Conference in London (1900); treasurer of the National Board of Control of the Epworth League (1900-08), and president of the American Ophthalmological and Otological Association (1904-05). His writings, besides those syndicated in the daily press, which he continued throughout his senatorial career, included *Refraction*, a textbook, with A. E. Ibershoff (1899-1905); *The Health Book* (1924), and *Dr. Copeland's Home Medical Book* (1935).

COPPER. Statistics covering certain phases of the copper industry in 1938 indicated a decided drop in activity from the record for 1937, according to surveys by the U.S. Bureau of Mines. A very subnormal rate of consumption in the United States during the early months of 1938 was accompanied by a fairly steady rate of production which caused stocks to mount and prices to fall. By summer several of the large mines were either closed, or operating far below capacity. Consumption began to increase in midyear, the stock situation improved, and many mines were re-opened.

Smelter output from domestic ores for the year, according to preliminary figures, was considerably below 1937; the actual production for 11 months and estimated for December was 1,122,000,000 lb., a decrease of 33 per cent from the output of 1,669,322,278 lb. in 1937.

The production of new refined copper from domestic sources was about 1,087,000,000 lb. compared with 1,644,505,129 of 1937. U.S. output of new refined copper from domestic and foreign sources in 1938 amounted to about 1,569,000,000 lb. compared with 2,133,627,803 in 1937, a decrease of

565,000,000 lb. or 26 per cent. The production of secondary copper by primary refineries decreased from 313,211,103 lb. in 1937 to about 185,000,000 in 1938. Thus the total primary and secondary output of copper by refineries in 1938 was 28 per cent lower than in the preceding year—a production of about 1,754,000,000 lb. being reported for 1938, as compared with 2,446,838,906 in 1937.

Exports of metallic copper during 1938 amounted to 844,027,664 lb. valued at \$86,806,141 compared with 692,458,087 exported during 1937. Imports of unmanufactured copper during 1938 amounted to 411,436,690 lb. valued at \$37,872,300 compared with 559,749,133 for 1937.

Refineries estimated that at the end of 1938 approximately 321,000,000 lb. of refined copper would be in stock, a 10 per cent decrease from the reserve of 358,000,000 at the end of 1937. Stocks of blister copper at the smelters, in transit to refineries, and at refineries, and metal in process of refining would be about 485,000,000 lb. Dec. 31, 1938, compared with 428,000,000 reported on hand at the end of 1937. Total smelter and refinery stocks at the end of 1938, therefore, would be 806,000,000 lb., representing an increase of 20,000,000 or 3 per cent from stocks at the end of 1937.

Mine or smelter output of copper of the world, outside of the United States and custom intake, including scrap, as reported by the Copper Institute, amounted to 1,295,326 tons of 2000 lb., in 1938, against 1,349,138 in 1937. World consumption outside of the United States in 1938 was 1,343,975 tons compared with 1,282,284 of the previous years.

COPYRIGHT. Registrations for the fiscal year 1937-38, according to the report of the U.S. Register of Copyrights, numbered 166,248, as compared with 154,424 for the preceding year. Of these, 57,351 were classed as books, but included pamphlets, leaflets, and contributions in periodicals. Those printed in the United States numbered 52,528, those printed abroad in a foreign language, 3646, while the remainder, 1177, were English books registered for ad interim copyright. The chief classes of the remaining registration in order of numerical importance were: Periodicals (numbers), 39,349; musical compositions, 35,334; dramatic or dramatico-musical compositions, 7369; works of art, models, or designs, 3330; drawings or plastic works of a scientific or technical character, 3309; photographs, 3174; prints and pictorial illustrations, 3010; maps, 1200; lectures, sermons, addresses, 1034; motion pictures not photoplays, 1016; motion-picture photoplays, 873; reproductions of works of art, 59. The renewals numbered 9940 as compared with 8589 in the preceding year. The fees applied during the year amounted to \$298,779. The total number of articles deposited during the fiscal year ended June 30, 1938, was 257,234.

The gross receipts of the Register's office for the fiscal year were \$326,326; the total expenditures for salaries, \$250,322, and for supplies, \$1920.

CORN. Data on the world's production in 1938 were incomplete at the close of the calendar year as only 15 countries had reported yield estimates to the International Institute of Agriculture. The yields of the leading countries among these, not including the United States, were reported as follows: Rumania 208,653,000 bu., Yugoslavia 173,499,000 bu., Italy 108,007,000 bu. (not including the summer planting), Hungary 101,600,000 bu., and Manchoukuo 92,329,000 bu. In 1937 the 33 reporting countries, including the United States and the Soviet Republics, produced 3,819,295,000 bu. on

146,489,000 acres. Canada in 1938 produced 7,690,000 bu., an increase of 42 per cent over the preceding year and 25 per cent above the average for the five years 1932-36. Argentina, the leading corn-growing country south of the equator, reported for the crop-year 1937-38 a yield of 174,166,000 bu., which was nearly 50 per cent below the average yield for the five crop years 1932-33 to 1936-37. The average production of the Soviet Republics for the five years 1932-36 was 146,293,000 bu.

According to estimates published by the U.S. Department of Agriculture, the 1938 corn production for all purposes was 2,542,238,000 bu., which was 4.1 per cent under the 1937 crop and 10.2 per cent above the average production for the 10 years 1927-36. These estimates included the grain equivalent of corn used for silage, forage, and pasturing. The total acreage of corn harvested in 1938 was 91,792,000 acres, compared with 93,741,000 acres in 1937 and the 10-year average of 100,259,000 acres. The average yield per acre, 27.7 bu., compared with 28.3 bu. in 1937, the highest during the past 15 years, and with 22.9 bu., the 10-year average. The crop was generally above average quality, which was in part due to timely harvesting favored by good weather and the increasing use of mechanical corn harvesters. The States leading in the production of corn for grain and their yields were as follows: Iowa 438,438,000 bu., Illinois 363,015,000 bu., Indiana 162,975,000 bu., Ohio 147,400,000 bu., and Minnesota 123,224,000 bu. In these five States, which produced 48.5 per cent of the country's crop, the yields per acre ranged from 6 to 13 bu. above the average, largely due to a favorable season and the increasing acreage of hybrid corn. In the Great Plains area, especially in South Dakota, Nebraska, and Kansas, hot and dry weather in August reduced the yield materially.

The 1938 corn-silage production was estimated at 33,475,000 tons produced on 4,172,000 acres, compared with 35,233,000 tons and 5,156,000 acres in 1937 and 31,830,000 tons and 5,070,000 acres, the 10-year average. Although a reduced acreage was reported in 1938, a favorable season brought a higher-than-average production. The corn-silage production of the leading States was reported as follows: Wisconsin 8,840,000 tons, New York 4,040,000 tons, Minnesota 3,825,000 tons, Iowa 2,470,000 tons, and Pennsylvania 2,375,000 tons. In acreage harvested for silage Wisconsin ranked first, with 1,105,000 acres, followed by Minnesota with 450,000 acres, New York with 404,000 acres, Pennsylvania with 250,000 acres, and Iowa with 247,000 acres. While most of the corn silage was produced in the North Central States, the highest average yields per acre, from 10 to 11 tons, were reported from the Northeastern States and from Utah, Idaho, and Washington. The acreage of corn harvested for forage grazed by livestock in 1938 was reported at 5,514,000 acres as compared with 7,098,000 acres in 1937 and 12,103,000 acres, the 10-year average. The acreage so harvested in the leading States was estimated as follows: North Dakota 706,000 acres, Minnesota 675,000 acres, South Dakota 654,000 acres, Nebraska 483,000 acres, and Iowa 423,000 acres.

During the fiscal year ended June 30, 1938, the United States exported 103,269,000 bu. of corn, 198,000 bbls. of corn meal, 1,719,000 lb. of corn foods ready to eat, 13,064,000 lb. of hominy and corn grits, 215,000 lb. of corn oil, 121,743,000 lb. of corn starch and flour, 9,824,000 lb. of corn sugar, and 37,148,000 of corn sirup and imported 34,440,000 bu. of corn and 23,447,000 lb. of corn oil. As

compared with the preceding fiscal year these figures showed marked increases in the exports of corn meal, corn starch and flour and especially of corn as grain, and significant decreases in the imports of corn and corn oil.

The fifteenth National Corn Husking Contest was held Nov. 3, 1938, at Dell Rapids, So. Dak., and Ted Balko of Redwood Falls, Minn., won the national championship by husking 22.2 bu. in the prescribed 80 minutes. Owing to crop and weather conditions this record was far below the world's record of 41.52 bu. set by Elmer Carlson in Illinois in 1935.

CORN BORER. See ENTOMOLOGY, ECONOMIC.
CORNELL UNIVERSITY. A nonsectarian institution for the higher education of men and women in Ithaca, N. Y., founded in 1865. There were 6890 students enrolled in the autumn of 1938, distributed as follows: Graduate school, 873; law school, 186; medical college, the main division of which is in New York City, 286; arts and sciences, 1850; architecture, landscape architecture, and fine arts, 132; engineering, 1104; veterinary medicine, 163; agriculture, 1577; and home economics, 754, including 280 in hotel administration. Of these students, 1519 were women. The 1938 summer session registration was 2057.

The faculty, composed of 1547 members, had 40 professors emeritus, 316 professors, 239 assistant professors, 30 lecturers and associates, 435 instructors, and 587 assistants. The productive funds on June 30, 1938, amounted to \$31,953,239. The income applicable to current expenses was approximately \$8,988,711, including \$2,801,918 of State and \$815,256 of Federal appropriations. Gifts amounting to \$1,328,911 were received during the fiscal year. The land and buildings were valued at \$19,016,506, and the equipment at \$7,841,343. The library contained 1,010,070 volumes. President, Edmund Ezra Day, Ph.D., LL.D.

CORPORATIVE STATE. See AUSTRIA, BRAZIL, CUBA, DANZIG, CZECHO-SLOVAKIA, ESTONIA, GERMANY, GREECE, ITALY, LATVIA, LITHUANIA, POLAND, PORTUGAL, RUMANIA, and SPAIN under *Government and History*; FASCISM.

CORRIGAN, DOUGLAS. See AERONAUTICS.

CORSICA. A French island department in the Mediterranean, 100 miles southeast of Nice. Area, 3367 square miles; population (March, 1936), 322,854. Ajaccio (capital) had 23,917 inhabitants (1931).

COSMIC RAYS. See CHEMISTRY; PHYSICS.

COSTA RICA, kōs'tā rē'kā. A Central American republic. Capital, San José.

Area and Population. With an area of 23,000 square miles, Costa Rica had a population estimated at 615,000 on June 30, 1938 (471,524 at the 1927 census). The population is largely of Spanish and other European descent, except for some 18,000 Negroes in the Atlantic banana zone and about 3000 Indian aborigines. Estimated populations of the chief cities in 1936 were: San José, 63,635; Limón, 16,540; Cartago, 14,161; Alajuela, 10,282; Heredia, 8926; Puntarenas, 8395.

Education and Religion. Illiteracy is rapidly decreasing and the percentage among persons under 18 is very low. President León Cortés reported to Congress on May 1, 1938, that 41 new schools were opened during the preceding year, making a total of 645 schools with 2533 teachers and 62,455 pupils. There are colleges at Alajuela and Cartago. Roman Catholicism is the state religion but freedom of worship is guaranteed other faiths.

Production. The national economy is based

upon coffee, bananas, and cacao, the chief export crops. Exports of bananas in 1937 totaled 301,413,000 lb.; coffee, 58,466,000 lb.; cacao, 16,105,000 lb. Corn, rice, beans, sugar, fruits, and vegetables are grown for local consumption. Gold (\$466,079 in 1936) and salt are the only minerals produced. Manufacturing is confined to the production of a few articles for domestic use.

Foreign Trade. General imports in 1937 were valued at 66,639,000 colones (47,108,000 in 1936) and general exports at 64,583,000 colones (46,615,000 in 1936). In U.S. current dollars, the 1937 imports were \$11,879,000 (\$8,397,000 in 1936); exports, \$11,512,000 (\$8,309,000). The value of the chief 1937 exports was: Coffee, \$6,106,000; bananas, \$3,050,000; cacao, \$1,342,000; gold bullion, \$461,000. The United States supplied 42.5 per cent of the 1937 imports by value (43.6 in 1936); Germany, 23.1 (23.6); Japan, 8.2 (7.8); United Kingdom, 7.8 (7.7). Of the 1937 exports, the United States took 45.1 per cent (44.3 in 1936); United Kingdom, 20 (26); Germany, 19.5 (16.3); Japan, 0.6 (0.1). United States figures for 1938 showed exports to Costa Rica of \$5,449,329 (\$4,476,840 in 1937); general imports from Costa Rica, \$4,102,263 (\$4,434,488).

Finance. Actual budget receipts for the calendar year 1937 were 38,105,143 colones and expenditures 35,099,753 colones. Taking into account losses by exchange transactions and other deductions, there was a favorable balance of 1,843,743 colones. The 1938 budget estimated receipts at 32,800,000 colones and expenditures at 32,600,000; for 1939, the respective estimates were 30,750,000 and 31,299,000 colones. The external debt on Dec. 31, 1937 was 110,747,404 colones and the internal debt 33,692,330 colones, representing a reduction of 7,267,102 colones in the external and 4,250,540 colones in the internal debt during the preceding year (see *History*). The colon (par value, \$0.7879) had an average value of \$0.178 in the controlled market and \$0.177 in the uncontrolled market for 1937.

Transportation. In 1937 Costa Rica had 413 miles of railway line; about 1830 miles of roads, including about 150 miles of motor highways; 2697 automobiles; and 1412 miles of air routes (1938). A total of 578 vessels of 1,450,148 tons entered and cleared Costa Rican ports in 1936.

Government. Executive power is vested in a president elected for four years and legislative power in a Congress of 44 members, half of whom are elected (for four years) every two years. President in 1938, León Cortés Castro (Republican National party), who assumed office May 8, 1936.

History. In the biennial Congressional elections held Feb. 13, 1938, the Republican National party won 16 seats, the opposition Independent National party 4 and the Communists, who polled about 7000 votes, 2 seats. (One-half of the 44 seats were filled.) The result was to give President Cortés Castro's government a safe majority in Congress, his Republican National party holding 32 seats against 10 Independent Nationals and 2 Communists. A split appeared in the government ranks in September as a result of a statement by Juan Rafael Arias, president of Congress, favoring the election of the 80-year-old former President Ricardo Jiménez Oreamuno for his fourth term in 1940. The majority of the Republican National party representatives favored the election of Dr. Rafael Angel Calderón Guardia. Señor Arias resigned as president of Congress on September 6 and Dr. Calderón was elected his successor. Dr. Jiménez Oreamuno

announced on September 16 that he would not accept a fourth term.

After heated discussion Congress on July 21 approved a contract between the government and the United Fruit Co. for the development of banana plantations in the virtually uninhabited southern districts of the Pacific coast. The company agreed to invest \$10,000,000 in the cultivation of 9880 acres, the construction of wharves at Pantaquepos and Golfitoy, and of a railway from Puerto Cortés to the Panama frontier, a distance of 59 miles. These works were to become national property at the end of 50 years. The government agreed to maintain the export tax on bananas at two cents per bunch for 50 years. The company agreed to extend the government an advance payment of \$1,000,000 on its export taxes. Soon afterwards banana cultivators on the Atlantic coast complained that the United Fruit Co. was abandoning its activities in that zone. President Cortés Castro notified the company on August 19 that it must comply strictly with previous contracts regulating its activities on the Atlantic coast.

Steps were taken during the year toward expropriation of the Costa Rican properties of the American-controlled subsidiary of the Electric Bond and Share system. This subsidiary controlled light, power, transportation, and telephone facilities in San José and 32 adjacent suburbs and communities, its assets totaling \$3,300,000. Friction between the company and the government had been growing for some years. On May 4, 1938, the government ordered the assessment on the company for direct taxes increased from \$1,417,857 to \$3,259,976. By a 40 to 1 vote, Congress on August 10 authorized the government to expropriate the company's properties, the action following a year's fruitless negotiation between the company and the National Electric Board over rates. President Cortés Castro on August 23 signed the decree authorizing the issuance of a loan to pay for the property. Both the law and the Constitution provided for payment in advance of expropriation. Since Costa Rican loans were in default in the United States and Great Britain, there seemed little possibility of securing a foreign loan. The expropriation decree, however, placed the government in a better position to secure rate concessions from the company. The German Government in October offered to construct an electric power plant for the Costa Rican Government to be paid for with Costa Rican coffee.

It was reported on October 13 that the government had refused to permit entrance into the country of any more Jewish refugees from Europe. The government also commenced a study of the growing racial conflict between the largely white population of the interior highlands and the Negroes who were entering that region from the banana districts of the Atlantic coast in growing numbers. To check the commercial exploitation of the country's archaeological treasures, a decree of November 5 established strict government control of their excavation and sale. Negotiations with United States bondholders for a readjustment of the defaulted dollar loans totaling about \$8,000,000 were resumed by the Costa Rican Minister to Washington in August. The country's ability to pay was reduced by the economic depression which struck it following the collapse of coffee prices late in 1937, and the consequent reduction of the coffee export tax. Early in 1938 a Chilean expert was engaged to undertake the reorganization of the taxation and revenue systems.

Foreign Relations. A convention for the settlement of the 400-year-old boundary controversy between Costa Rica and Panama, which provoked a short undeclared war in 1921, was signed by the two governments on September 26. It provided for the division of the disputed territory, with Panama receiving a district bordering the Atlantic coast near the Sixaola River and Costa Rica an equal area in the interior. The treaty was presented to the Costa Rican Congress October 2 but public opposition to it became so violent that the President on the advice of 24 deputies withdrew the treaty on October 8 to prevent bloodshed. President Cortés Castro denounced the opposition to the pact as unjustified and dismissed from the public service those who participated in the protest demonstrations. The defeat of the treaty was followed by the expansion of armaments by both countries. It also offered an additional obstacle to the negotiations for settlement of the boundary dispute between Honduras and Nicaragua that were proceeding in the Costa Rican capital. See HONDURAS and PANAMA under *History*.

Costa Ricans were perturbed during 1938 by the country's increasing unfavorable trade balance with Japan, which was expected to react adversely upon Costa Rica's chief export markets in the United States and Great Britain. Some Japanese fishermen, excluded from Panama by the nationalization of the fishing industry there, transferred their base to Puntarenas. They had been suspected of espionage for Japan in the Canal Zone and adjacent waters. On November 18, President Cortés Castro ordered the Exchange Control Board to give preference in the purchase of foreign exchange to countries with which Costa Rica had a favorable trade balance. The order virtually barred Japanese and Italian goods since Costa Rica had large unfavorable trade balances with both countries.

COSTER, F(RANK) DONALD. See *MUSICA, PHILIP*.

COTTON. The cotton crop of the United States for 1938, as estimated by the Crop Reporting Board of the U.S. Department of Agriculture on Dec. 8, 1938, amounted to 12,008,000 bales of 500 lb., considerably below the record crop of 18,946,000 bales in 1937 and it compared with 12,399,000 in 1936, and 10,638,000 in 1935. The yield of lint per acre was estimated to average 226.8 lb., while the record was 266.9 lb. in 1937 and 179.8 lb. was the average for the period 1927-36. Of 26,144,000 acres in cultivation July 1, 1938, 3.1 per cent was abandoned later, and 25,346,000 acres were left for harvest, 25.5 per cent less than in 1937. The abandonment was greater than average, part being removed in compliance with the 1938 adjustment program.

The world carry-over of American cotton on July 31, 1938, as estimated by the New York Cotton Exchange Service, was about 13,652,000 bales, compared with 6,235,000 at the end of the previous season and 6,998,000 two years ago. The New Orleans Cotton Exchange estimated the 1937-38 carry-over at 13,803,000 bales. The carry-over of American cotton in the United States, estimated at 11,436,358 running bales, together with the above estimate of world total, indicated the carry-over of American cotton in foreign countries on Aug. 1, 1938, at about 2,215,000 bales. The world mill consumption of American cotton during the season ended July 31, 1938, was estimated at 10,930,000 bales compared with 13,093,000 bales in 1936-37, 12,503,000 in 1935-36, and 11,206,000 in 1934-35.

World supply of all cotton for the 1938-39 season

was estimated in December to total about 50,462,000 bales, an increase of about 100,000 bales over 1937-38 and one-fourth larger than the 10-year average, 1927-28 to 1936-37. The world carry-over of all cotton on August 1 was about 22,612,000 bales compared with 13,766,000 bales a year earlier and 14,214,000 bales, the 10-year average.

The prospective world supply of American cotton for the current season, 1938-39, was indicated at about 25,502,000 bales, about 855,000 bales more than in 1937-38 and only about 722,000 bales less than the high record supply of 1932-33. The stocks of spot cotton held as collateral against government loans on Nov. 23, 1938, were indicated at 9,860,000 bales.

Production in 1938 in the countries reporting was estimated currently to be for the United States, 12,008,000 bales; India, 4,014,000; U.S.S.R. (Russia), 3,500,000; China (including Manchuria), 2,300,000; Egypt, 1,523,000; Brazil, 1,950,000 (Northern States, 633,000); Mexico, 260,000; Chosen, 194,000; Turkey, 113,000; Greece, 67,000; Italy, 44,000; Bulgaria, 41,000; and Nyasaland, 10,000 bales. The total world production in 1938-39 was indicated by the U.S. Department of Agriculture at the close of 1938 at 28,400,000 bales, about one-fourth less than the record production of 1937-38, but still about 8 per cent larger than the 1927-36 average and the fourth largest in history. The total world acreage was placed at about 75,500,000 acres in 1938-39 versus 93,400,000 in the 1937-38 season. World production of commercial cotton in 1937 was estimated by the U.S. Bureau of the Census to be 35,591,000 (478 lb.) bales, of which the United States produced 18,252,000 (running) bales; India, 4,800,000; U.S.S.R. (Russia), 3,482,000; Egypt, 2,282,000; China, 1,500,000; Brazil, 2,191,000; Mexico, 350,000; Peru, 360,000; and all other countries, 2,374,000 bales. In 1937-38 Argentina produced 281,000 bales; Uganda, 314,000 bales; and Anglo-Egyptian Sudan, 264,000 bales, and, according to official estimates, India produced 4,942,000 bales.

The United States cotton crop for 1937, as reported by the Bureau of the Census, the estimated crop for 1938, and the quantity reported ginned to Dec. 13, 1938, are shown in the accompanying table.

UNITED STATES COTTON CROP, 1937-38

States	Crop in 1937 500-lb. bales	Estimated crop—1938 500-lb. bales	Reported ginned Dec. 13, 1938, running bales
United States ..	18,945,028	12,008,000	11,413,688
Alabama	1,636,363	1,080,000	1,058,016
Arizona	312,908	196,000	154,771
Arkansas	1,915,206	1,340,000	1,293,334
California	738,700	423,000	353,509
Florida	34,605	25,000	22,010
Georgia	1,505,946	857,000	842,155
Louisiana	1,103,622	676,000	650,944
Mississippi	2,692,427	1,715,000	1,654,190
Missouri	397,226	337,000	324,122
New Mexico ..	156,409	95,000	85,987
North Carolina ..	781,483	400,000	376,678
Oklahoma	763,403	570,000	542,691
South Carolina ..	1,023,319	650,000	631,122
Tennessee	660,394	487,000	466,369
Texas	5,163,895	3,125,000	2,934,758
Virginia	40,379	15,000	9,433
All Others	18,743	17,000	13,599

The table includes for 1938, under the ginning report, 151,324 round bales counted as half bales and also 15,236 bales of American-Egyptian cotton, and 3325 bales of Sea Island cotton. The 1938 crop of Arizona was estimated to include 21,000 bales of American-Egyptian cotton grown on 44,000 acres; and 3100 bales of Sea Island cotton were

grown in Georgia and Florida. The crop of Lower California, Mexico, was estimated at 37,000 bales harvested from 94,000 acres, not included in the totals.

The oil mills in the United States, during the cotton year ended July 31, 1938, crushed 6,325,733 tons of cottonseed. The products of the seed included 1,470,528 bales of linters, 1,625,932 tons of hulls, 2,830,420 tons of cake and meal, and 1,961,485,735 lb. of oil.

Exports of cotton and linters for the year ended July 31, 1938, amounted to 5,598,415 running bales of cotton, and 274,625 bales of linters or a total of 5,873,040 bales. The principal exports of cotton were to United Kingdom, 1,551,843 bales; France, 715,850; Germany, 653,845; Italy, 505,379; Belgium, 189,524; and other European countries, 747,952; Japan, 690,513; China, 22,786; and Canada, 245,955 bales. The United States imported during the same period a total of 159,015 bales; from Egypt, 43,499 bales; India, 48,040; China, 16,491; Mexico, 43,598; Peru, 744; and from other countries, 6643 bales.

The consumption of all cottons in the United States dropped in 1937-38 to 5,747,978 bales from 7,950,079 bales in 1936-37. The cotton used by American mills was consumed largely, nearly 85 per cent, in the cotton-growing States. Of 25,986,620 spindles in place Dec. 31, 1938, 22,444,784 were active during December, of which 17,062,000 were located in Cotton States, 4,780,766 in New England, and 601,218 in other States. The number of active spindle hours averaged in Cotton States 300, in New England 222, and elsewhere 180.

The world consumption of cotton (exclusive of linters in the United States) for the year ended July 31, 1938, according to the U.S. Bureau of the Census, approximated 26,748,000 bales compared with the previous year's record consumption of 30,820,000 bales. The estimates based on reports of the New York Cotton Exchange Service were equivalent to about 27,565,000 bales, around 10 per cent below 1936-37 but 8 per cent above the average for the 10 years ended 1936-37. Of the total consumption in 1937-38, about 16,635,000 bales were foreign cotton and 10,930,000 bales American; in 1936-37, 17,596,000 bales were foreign and 13,093,000 bales were American.

The cotton consumption of 5,748,000 bales in the United States in 1937-38 was 28 per cent less than the unusually large consumption in 1936-37 but only 7 per cent less than the average for the decade ending 1936-37, the decrease under 1936-37 resulting largely from the marked recession in general business conditions and decreased consumer textile buying. The total consumption of all cotton in Europe in 1937-38 was estimated by the U.S. Census Bureau at 11,400,000 bales, compared with 11,559,000 bales during the previous season; in Japan 3,370,000; in China 1,250,000; in India about 2,980,000; and in Canada 264,000 bales. Total mill consumption in foreign countries of 21,817,000 bales in 1937-38 was 5.3 per cent less than in 1936-37 but 12.5 per cent above the 1927-37 average. Consumption of American cotton outside the United States, 5,314,000 bales, was about the same as in 1936-37 but 26.8 per cent less than the 10-year average. In 1937-38 American cotton comprised only 24 per cent of the total consumption of cotton outside the United States, against 23 per cent in 1936-37, 29 in 1935-36, and 37 per cent during the decade 1927-36. Increased competition from rayon reduced the total consumption of cotton, especially in certain important cotton-consuming countries,

but substitution of foreign growths for American accounted for the sharply reduced proportion of American cotton used in foreign mills during recent years.

The price of middling $\frac{7}{8}$ -inch cotton at the 10 spot markets averaged 8.66 cents per lb. during the year ended July 31, 1938, compared with 12.70 in 1936-37, 11.55 in 1935-36, 12.36 in 1934-35, 10.81 in 1933-34, 7.15 in 1932-33, and 12.42 cents, the average of 1927-28 to 1936-37. Prices averaged 8.54 cents in January, 1938, 8.92 in February, and 8.89 in March. They averaged in April 8.75 cents, May 8.51, June 8.39, July 8.83, August 8.37, September 8.10, October 8.55, November 8.65, and closed on December 30 at a range of 8.19 to 9.03 cents, averaging 8.60 in the southern spot markets and at 8.88 cents in New York, 8.65 New Orleans, and 5.25d at Liverpool. Prices received by producers at local farm markets on Dec. 15, 1938, were estimated to average 8.20 cents per lb. for lint and \$23.04 per ton for cottonseed, compared with 7.67 cents and \$18.50, respectively, on Dec. 15, 1937. The cash income from cotton and cottonseed in 1938 was estimated at \$667,235,000 compared with \$883,776,000 in 1937.

An increase of about 53 per cent in the size of the United States crop made gross returns to farmers from cotton and cottonseed in the 1937-38 marketing season slightly larger than in 1936-37, despite the decrease in prices, and about the same as the average for the decade 1927-36. Combined returns to growers from cotton and cottonseed, together with Government payments for cotton, in 1937-38 was slightly less than in 1936-37 and about 9 per cent larger than the 10-year average. Cotton prices, if continued at current levels, together with the greatly reduced 1938 crop, would result in gross farm returns from cotton in 1938-39, including Government loans and payments, being substantially less than in 1937-38. Government loans to co-operating producers on the 1938 crop were on the basis of 8.30 cents per lb. for middling $\frac{7}{8}$ -inch cotton with specified premiums and discount for cotton of other eligible grades and staple lengths. The qualities specified as being eligible for the loan probably would exceed 90 per cent of the 1938 crop. The 1938 Agricultural Conservation payments were at the rate of 2.4 cents per lb. on the normal yield of the co-operating producers' 1938 cotton acreage allotment. In addition, price adjustment payments averaging about 2.9 cents per lb. on 60 per cent of each co-operating producer's 1937 cotton base production were being paid during the 1938-39 marketing season. Total Government payments on cotton during the 1938-39 season were expected to approximate \$265,000,000, compared with \$72,000,000 in 1937-38, and the previous record payments of \$179,700,000 in 1933-34.

Cotton of the 1938 crop ginned up to Dec. 1, 1938, averaged higher in grade and longer in staple length compared to that ginned up to Dec. 1, 1937, according to a report based on the 11,214,266 bales of American upland cotton reported as ginned prior to that date. Estimates were that 22 per cent was white strict middling or better, 33 per cent white middling, about 21 per cent white strict low middling and below, and 21 per cent spotted cotton. About 4 per cent was shorter than $\frac{7}{8}$ in. in staple, 44 per cent ranged from $\frac{7}{8}$ in. to $3\frac{1}{2}$ in., 43 per cent ranged from 1 to $1\frac{1}{2}$ in., and 9 per cent was $1\frac{1}{2}$ in. and longer in staple. About 95 per cent of the cotton ginned up to Dec. 1, 1938, was tenderable, versus 87.5 in 1937.

CRETE, krēt. An island in the Mediterranean, forming a geographical division of Greece. Area, 3199 square miles; population (1928 census), 386,427. Chief towns: Khania (Canea), the capital, 26,604 inhabitants; Irakleion (Candia), 33,404 (42,057 in 1935). See GREECE under *History*.

CRICHTON-BROWNE, SIR JAMES. A British brain specialist, died in Dumfries, Scotland, Jan. 31, 1938. Born in Edinburgh, Apr. 20, 1840, he was educated at the University of Edinburgh (M.D., 1862) and at the University of Paris. He served as medical officer in the Derby, Devon, and Warwick county asylums, and in 1865 was appointed medical superintendent of the Newcastle-on-Tyne Boro Asylum and lecturer in psychological medicine at the College of Science there. In the following year he became medical superintendent at West Riding Asylum at Wakefield, which institution under his management became noted for its excellence and also a great training

center in mental diseases. At this time he started a research laboratory, established and edited the West Riding Asylum Medical Reports, and was co-editor of *Brain*. Dr. Crichton-Browne left Wakefield in 1875 when he became a Visitor in Lunacy, from which office he retired in 1922.

A bulwark of British medicine, he was made a fellow of the Royal Society in 1883, was knighted in 1886, and from 1889 to 1926 served as treasurer of the Royal Institution of Great Britain. Sir James was the author of *Education and the Nervous System* (1884); *Overpressure in Schools*, a translation from the Danish of Kestals (1885); *What We Owe to Alcohol* (1918); and other works on mental and nervous diseases. He was one of the editors of the *New Standard Dictionary* (1913) and of the *Standard Family Physician* (1908). Also, he was the author of several delightful books of reminiscence, *Victorian Jottings* (1926); *Stray Leaves from a Physician's Portfolio* (1927); *What the Doctor Thought* (1930); *The Doctor's Second Thoughts* (1931), and *The Doctor's After-Thoughts* (1932).

CRIME. The Problem of Crime. Analyses made by the U.S. Federal Bureau of Investigation indicated that there were fully 4,000,000 criminals operating in the United States today, of whom a quarter of a million were murderers. According to J. Edgar Hoover, the Director of the Bureau, the crime bill for the country was approximately \$15,000,000,000 annually, or about \$120 for every man, woman, and child. Mr. Hoover estimated that every 22 seconds saw a serious crime committed in the United States. There was a death by criminal violence every 39 minutes. During 1937 his figures showed nearly 1,500,000 major crimes were committed, of which 7859 were murders, 5705 were manslaughter cases, 59,786 were robberies, 45,478 were assault cases, 292,870 were burglaries, 780,031 were larceny cases, and 215,569 were auto thefts. The grand total exceeded the figures for 1936 by 6 per cent.

The Bureau of Investigation had an enviable record in coping with those crimes that fell within its purview. During 1937 its operations cost the government \$6,200,000 but on the other hand it turned back to the taxpayers over \$47,000,000 in total value of recoveries of stolen property, fines, and savings in cases which it had handled. Its successes in the handling of kidnapping cases were also outstanding. Since the passage of the Federal Kidnaping Statute in 1932, 130 kidnapping cases occurred, of which 127 were solved by the F.B.I. Also, as a result of its activities and the co-operation it was receiving from State agencies, bank robberies decreased 75 per cent in the past few years. Mr. Hoover reported that his Bureau, to quote him, "was able to make progress in our campaign to uproot crime in taking action against the crooked lawyers, the unethical doctors who try to mutilate the fingerprints of criminals, the hideout owners, the go-betweens, the 'fixers' who front for criminals, the fences, and all the rest of the slimy crew that feeds upon crime."

The causes of crime by this time are familiar to the American population. In the first place there is no question that one of the primary causes was the existence of poverty. It has been shown statistically that the great majority of crimes were committed by persons who lived in slum areas, who had no employment or were under-employed, and who were malnourished. In the second place, slum areas were undoubtedly breeding places of crimi-

nals because these were located in the most crowded and unsanitary sections of cities, because homes in such places afforded no adequate opportunities for decent social living, and because recreational facilities were inadequate. As a result, young men gathered on street corners and in poolrooms and easily became the prey and tools of professional criminals. In the third place, sociologists were pointing recently to the fact that great disparities in income and notably the existence of plenty and poverty side by side succeeded in breaking down the resistances of many weak persons. On this point Dr. Leverett S. Lyon of the Brookings Institution made the following interesting observation:

While it is true that people's wants are more or less boundless, the really keen desires of most persons for certain goods at any given time are typically for those which are but a little beyond their reach. Most persons of modest incomes do not yearn ardently for yachts and racing stables. It is the addition to their standard of living of much simpler things with which they are concerned; for example, a radio phonograph instead of a radio, a second automobile, a college education for their children, or even just more clothes and more money for amusements. It is probable, therefore, that if society is able to make a more or less consistent, even though not a great, advance in the standards of living of most of its members, that the impelling desires of most of them for the goods which they do not have, tends to be gratified.

In the fourth place, it is to be noted that organized crime had become more and more a characteristic of our modern social organization. As Thomas E. Dewey, District Attorney of New York, pointed out, up to 30 years ago the American criminal was a free lance who operated as a small-time burglar or pickpocket. It is true that from time to time organized gangs appeared, but these were for the purposes of carrying on depredations against small tradespeople. In recent years, however, it may almost be said that criminal syndicates were operating with ramified interests in many cities. To quote Mr. Dewey: "They are rich and powerful, and have brains even more than brawn. There are few illegal enterprises which have not become a part of the empire of organized crime. . . . Every large criminal organization which my office has prosecuted has been set up like an industrial enterprise, with department heads and a strong-arm squad and lawyers who advise in every act."

Sociologists were prepared to admit that the attack on crime represented no simple problem. The solutions necessitated wide-sweeping changes in our social structure as well as the elimination of a number of more obvious evils which had come to cluster about our legal and penal systems. The *American Observer*, in an analysis of the question, pointed out that there were a number of issues that had to be faced in conjunction with the problem. (1) Unemployment would have to be solved, for not only did unemployment serve as an economic motivation but it contributed to a decline of moral stamina on the part of those who were habitually out of work. (2) Standards of living would have to be raised for a large portion of the population. (3) The slums would have to go. (4) Community programs would have to be devised for the purposes of arousing the whole citizenry to the serious nature of this situation. (5) An extended program enlisting all the educational forces of the country, the schools, the churches, the press, the radio, and motion pictures, would have to be created for the study of the causes and the cure of crime. (6) A recreational program was of the first importance. (7) Dishonesty among public officials would have to be eliminated. Everywhere there was agreement that there was an intimate and direct connection

between politicians and criminals. (8) Improvements were necessary in the training of policemen and in their better selection and surveillance. (9) A more intelligent approach to the punishment aspects of the problem was imperative. The *American Observer* believed that there was a good deal of truth in the statement of William J. Quinn, Chief of Police of San Francisco, that: "Penal institutions at present are the worst places for fostering crime."

Mr. Hoover was particularly outspoken in his insistence that the whole parole system required re-examination. He pointed out that there was little point in apprehending desperate criminals, often with serious loss of life, if such criminals were soon released to prey upon society. Said he, on the question of parole:

I am a friend of parole. I cannot, however, justify at any time the senseless, super-sentimental application of misguided sympathy for depraved and unreformed criminals. I have always held, and will continue to hold, that our jails are created for the purpose of protecting society from those who, by reason of their criminalistic tendencies, constitute a permanent menace to the law-abiding citizens of our country. I have seen too many examples of the folly of releasing confirmed criminals to continue to prey upon our country's citizenry, to pillage and slay until again incarcerated, then to be confined for a comparatively short period and again released.

Prison Labor. The Bureau of Labor Statistics, which has been studying prison labor for a long period of time, came to the interesting conclusion, as a result of its statistical analyses, that the past half century had seen a steady decrease in the proportion of prison inmates employed at productive labor. During the period 1923-36, the prison population, in the institutions of 14 jurisdictions covered by its examinations, nearly doubled, but the number of prisoners assigned to productive labor increased only 21.7 per cent. The value of goods produced by such labor also decreased sharply so that the value of output in 1936 was only 44.3 per cent of that in 1923. According to the Bureau, prison labor had been utilized under six systems. The *Lease system*, by which the State entered into a contract with the lessee, who agreed to receive the prisoners, paying the State a specified amount per man per day, had completely disappeared, although it had been very popular up to 1923. The *Contract system*, which had been very popular in 1923 and in 1932, when earlier surveys had been made, was declining in significance in recent years. Under this system an outside contractor arranged with the institution for the labor of the prisoners at a stipulated amount per capita per day. The State assumed no risk of loss as the contractor usually furnished his own raw materials and provided his own foremen, inspectors, machinery, and tools. The State, however, housed, fed, clothed, and guarded the prisoners. The *Piece-price system* was also declining. This system was nearly the same as the *Contract system* except that under it the contractor, instead of paying a stated amount per day, contracted with the institution for the labor of the prisoners at an agreed price per unit of output. The *State-account system* was becoming more popular in recent years. Under it the institution carried on a productive enterprise and disposed of the product on the general market and in competition with the goods produced by free labor. The institution assumed all the business risks. If the business was associated with manufacturing, the institution bought the raw materials and sold the finished product in the same way as would be done by any manufacturing concern, except that frequently it retained part of the product for use in the prison.

The *State-use system*, which was beginning to supplant the earlier types, also put the institution into the business of production. However, the use or the sale of the goods it produced was limited to the institutions in which they were produced or to other State or Federal institutions. The purpose here, of course, was to make prison products available to public institutions while avoiding direct competition with free-labor products. The *Public works and ways system*, which was becoming most frequently employed in recent years, was very much like the *State-use system* with the emphasis upon production not of consumer goods, but upon public works. Those prisoners employed in such activities were engaged in the constructive repair of prison buildings, other public buildings, roads, parks, and bridges, and for flood control, reforestation, clearing land, and the like.

The Bureau's studies indicated a definite increase in those systems which got prison-made goods out of the open market where they competed with the products of free labor. Whereas in 1923 prisoners employed under the *State-use* and the *Public works and ways systems* formed only 29.2 per cent of the total working at productive processes, in 1936 they formed 60.5 per cent. The proportion employed under the *Contract system* fell from 33.4 per cent to 6.1 per cent. This movement was facilitated by the Hawes-Cooper Act of 1929 which came into effect in 1934 and which forbade the movement of prison-made goods into interstate commerce. When the *Contract* and *Piece-price systems* flourished, manufactured articles formed the largest part of prison output. By 1936, however, the principal manufactures in the 14 jurisdictions covered by the Bureau's studies formed only 43 per cent of the value of output as compared to 82.5 per cent in 1923. There was a decided decrease in the manufacture of such articles as brooms, hosiery, pants, shoes, furniture, and castings, all formerly made largely under the *Contract system*. The articles which have shown an increase, like automobile license plates, were being manufactured for State use only.

This movement away from contract production of goods competing with free labor placed squarely before prison authorities the necessity for providing work for inmates in order to prevent the demoralizing effects of idleness. The spreading of

work among inmates resulted in a sharp decrease in the value of goods produced per prisoner. In 1923 the annual average value of goods so produced was \$1850 as contrasted with \$900 in 1932 and \$650 in 1936. Tables I and II indicate some of the aspects of this very interesting problem.

Federal Prison Industries Corporation. In 1934 Federal Prison Industries Corporation was established to determine the manner and extent of industrial operations in Federal prisons and to diversify the work so that no single industry should bear an undue burden of competition from prison-made goods. In 1937 the ratio of industrial employees to total prison population was 18.3 per cent, which was a slight increase from the 17.6 per cent in 1936. In 1937, also, the net sale of prison goods aggregated \$3,777,000, of which \$2,557,000 represented cost of material and \$207,000 labor costs, leaving a net profit of surplus on the year's work of \$568,000. The Board also gave attention to the importance of correlating vocational training in the institutions with the work opportunities. Industrial counselors were employed in the major institutions to advise with the officials in planning for the training and retraining of prisoners. It is interesting to note, too, that accident compensation was made to prisoners for the first time in 1937. While in the institution, the prisoner received during incapacity only his average monthly wage. He received, however, compensation for his injury after his release. This was based upon the idea that the amount of compensation should be linked with the economic position of the inmate after he had become a free member of society once more.

Regulation of Prison-Made Goods. The Prison Industries Reorganization Administration indicated that 12 States prohibited altogether the sale or distribution of prison-made goods on the open market, that 16 additional States enacted general prohibitions with certain exemptions, and that 8 States, including 3 of the foregoing, had legislation specifically prohibiting the sale of imported prison-made goods. In other words, 33 States had placed some restriction on the sale of prison products. Practically all States permit the use of prisoners on roadwork and 28 provide for the use of prisoners on public works. According to the Administration, Colorado, Illinois, Kentucky, Montana, New York, and Ohio had complete legislation

covering prison labor and sale of prison-made goods. Their laws specifically prohibited sale of prison goods on the open market (including imported products), regulated the use of prison labor and the manufacture and consumption of the products, and provided for the use of prison labor on roads and in the construction of public works. As has already been pointed out, the Hawes-Cooper Act so divested prison-made goods of their interstate character as to permit States to regulate the sale of such goods within their borders, even though produced in penal systems of other States. The Ashurst-Sumners Act of 1935 strengthened the arm of those States seeking to cope with the problem of prison-made goods by giving Federal aid in the enforcement of any State law through declaring it a Federal offense if prison-made goods were transported to a State in violation of its laws.

CUBA. An island republic of the West Indies. Capital, Havana.

Area and Population. With an area of 44,164 square miles, Cuba had a population estimated at 4,164,994 on Dec. 31, 1937 (3,962,344 at the 1931 census). The estimated racial classification of the population in 1935 was: White, 2,956,446; colored, 1,114,635. The estimated populations of the chief cities, with suburbs, on Dec. 31, 1936, were: Havana (Habana), 552,133; Holguin, 137,016; Camagüey, 135,126; Santiago de Cuba, 104,729; Santa Clara, 98,183; Marianao, 84,357; Moron, 83,291; Matanzas, 80,954.

Education and Religion. According to the 1931 census, 39 per cent of the population 10 years of age and over were illiterate. For the 1937-38 school year, there were 4115 primary schools with a total enrollment of 423,420 pupils (312,972 white and 110,478 colored), and an average daily attendance of 293,193. It was estimated that 4000 more classrooms were needed to house all children of primary school age; there were 8300 classrooms in 1938. In 1936-37 there were 94 night schools, with 7383 pupils; 323 private schools, with 29,736 pupils. Special government institutes for secondary education are maintained in each province. The University of Havana, reopened in 1937, had about 6000 students. Most Cubans profess the Roman Catholic faith but there is no state church.

Production. Agriculture is the chief support of the population. Sugar and cane products accounted for 80 per cent of the value of all exports in 1937. Sugar exports totaled 2,525,441 long Spanish tons in 1938 (2,650,611 in 1937). For the production, price, and total value of raw sugar output in previous years, see 1937 YEAR BOOK, p. 195. Tobacco production in 1937 was 54,615,000 lb.; coffee, in 1937-38, about 31,000 metric tons. Corn, cacao, rice,

fruits, and vegetables were other leading crops. Cuba in 1936 had 4,964,000 head of cattle and 695,000 horses, mules, and asses; in 1934 there were 952,000 swine, 42,000 sheep and 9000 goats. Mineral production in 1937 was: Iron ore, 212,161 tons (409,629 in 1936); chrome ore, 97,766 tons (70,388); manganese, including sintered, sorted, and low-grade ore, 104,842 tons (47,706); copper ore, 341,184 tons (301,310). The principal branches of industry are vegetable oils, meat products, clothing, footwear, furniture, textiles, paints, paper, glass, cement, and pharmaceuticals. During 1938 foreign tourists and excursionists calling at the Port of Havana numbered 68,667 and 89,346, respectively, as compared with 62,344 and 116,152 in 1937.

Foreign Trade. General imports in 1938 were valued at 106,007,325 Cuban pesos and exports at 142,677,752 pesos (preliminary), as compared with 129,572,000 and 186,071,000 pesos, respectively, in 1937. The United States supplied imports to the value of 75,152,388 pesos (70.8 per cent of the total) and took exports valued at 108,362,605 pesos (75.9 per cent) in 1938, as compared with 88,847,000 pesos (68.6 per cent) and 150,158,000 pesos (80.7 per cent), respectively, in 1937. The leading 1937 imports, in order of value, were cotton manufactures, rice, iron and steel manufactures, machinery, chemical and pharmaceutical products, and wheat flour. The chief 1937 exports were: Raw sugar, 104,845,000 pesos; refined sugar, 22,440,000 pesos; molasses, 18,175,000 pesos; tobacco, 11,235,000 pesos; cigars, 3,655,000 pesos; bananas, 3,352,000 pesos.

Finance. Budget estimates for the fiscal year ended June 30, 1939, placed receipts at 83,250,000 pesos and expenditures at 83,174,000 pesos. However, by the law of Nov. 2, 1938, the original 1938-39 budget continued in effect only until Dec. 31, 1938. The fiscal year was changed to coincide with the calendar year, effective Jan. 1, 1939, and the budget was scaled down to accord with the estimated budgetary income of 75,000,000 pesos. As Congress failed to act on the proposed 1939 budget, the President extended with minor changes the re-adjusted budget in effect during the last quarter of 1938. This anticipated revenues of 76,000,000 pesos in 1939 and expenditures of 75,992,000 pesos.

Exclusive of a floating debt estimated late in 1938 at 60,000,000 pesos, the public debt on Dec. 31, 1937, totaled 134,468,000 pesos (external funded, 42,504,000; internal funded, 7,567,000; special public works debt, 80,867,000; sugar bonds, 3,530,000). The Cuban peso, par value \$1 U.S. currency, exchanged practically at par throughout 1937 and 1938.

Transportation. Cuba has 3079 miles of privately owned railway line, which in 1936-37 carried 9,980,000 passengers and 18,320,000 long tons of freight, the gross operating revenues totaling \$17,663,000. Roads and highways in 1937 extended 2214 miles; number of automobiles, 39,752. Air service is provided by both the Cuban National Aviation Co., with 701 miles of local routes in 1938, and Pan American Airways. During 1938, 1013 planes of the latter system arrived at Cuban airports with 15,335 passengers, 46,010 lb. of mail and 49,236 lb. of express. Pan American Airways planes leaving the island totaled 1032, with 14,906 passengers, 38,867 lb. of mail, and 11,338 lb. of express. During 1937, 4479 vessels of 11,238,000 net registered tons entered Cuban ports with 2,278,000 metric tons of cargo.

Government. Following the revolutionary over-

throw of President Machado on Aug. 12, 1933, the Constitutions of 1901 and 1928 were declared null and void and a series of provisional governments followed. A decree of June 12, 1935, restored the 1901 Constitution with certain modifications. Elections for a constitutional President, Vice-President, and Congress and for provincial and municipal officers were then held Jan. 10, 1936, with the newer and more radical parties boycotting the polls. The new Congress adopted another Constitution (finally approved, Dec. 14, 1936), establishing a semi-parliamentary form of government, with a premier and cabinet appointed by the President but removable by Congress. Before this Constitution was proclaimed the constitutional President, Dr. Miguel Mariano Gómez, was impeached and ousted by Congress at the behest of Col. Fulgencio Batista, chief of staff of the Cuban Army and unofficial dictator. Dr. Gómez was replaced by Dr. Federico Laredo Bru, effective Dec. 24, 1936. On June 9, 1937, Congress enacted a law providing for elections in 1938 for a Constituent Assembly to draft a new Constitution. Meanwhile, the 1935 Constitution remained in force. At the beginning of 1938, Congress consisted of a Senate of 36 members, of whom the Laredo Bru Government controlled 27, and a House of Representatives of 162 members, in which the government's working majority was about 60 per cent. For developments in 1938, see *History*.

HISTORY

Political Developments. Elections to replace one-half of the membership of the House of Representatives were held Mar. 5, 1938, in accordance with the arrangements made in 1937 (see 1937 YEAR BOOK, pp. 196 f.). The voting returned a larger pro-government majority to the House as the parties opposing Colonel Batista's domination of the government boycotted the polls. They included the Republican party led by ex-President Miguel Mariano Gómez, the Democratic Republicans under former President Mario G. Menocal, and the Cuban Revolutionary party led by former President Ramón Grau San Martín. Less than 40 per cent of the eligible voters cast their ballots. The legal opposition parties, charging that the election was the "most shameful" in the republic's history, joined with various outlawed political groups in demanding impartial elections for a Constituent Assembly to draw up a new Constitution.

Responding to the growing popular demand, Colonel Batista announced on May 4 that he would suspend further application of his much-criticized Three-Year Plan pending the election of a Constituent Assembly some time in 1939. His Three-Year Plan for the economic and social reconstruction of the nation had been issued July 25, 1937, (see 1937 YEAR BOOK for details). In many quarters it aroused fear that Batista aimed at the establishment of a corporative state on the Italian or German model. The revival of anti-government conspiracies among radical and liberal groups early in 1938 was attributed to this fear.

The Army's secret police announced on Feb. 26, 1938, that they had broken up an "anti-Fascist plot" to overthrow the government through a revolutionary strike. More than a score of Cuban and Spanish Communist leaders were arrested as the ringleaders. On the night of March 7, Batista's soldiers raided a meeting of conspirators plotting his overthrow, at which members of the military forces were present along with known political enemies of the regime. Four persons were killed

and one wounded in the ensuing clash. Four sergeants, one corporal, and two privates were sentenced to jail terms by a military court on April 20 in connection with the plot.

Batista's suspension of his Three-Year Plan, his pledge to permit elections for a Constituent Assembly, and the swing to the Left that marked his policy during the remainder of the year were all taken to indicate a desire to run for President when elections were held under the projected new Constitution. Under army pressure, Congress on July 13 passed an electoral census bill as a preliminary to the forthcoming elections. Opposition parties protested that the measure failed to guarantee the fair registration of voters. But the hostility of these groups was eliminated in large part by Batista's subsequent conciliatory gestures.

Meanwhile the public's slight confidence in the existing Congress was further weakened by the scandal accompanying the passage in February of a law for the partial settlement of Cuba's Public Works debt. The law authorized an issue of \$85,000,000 in new bonds, of which \$44,953,700 was allotted to cover the principal and past-due (adjusted) interest on Public Works serial certificates and gold bonds and \$20,000,000 for the retirement of the so-called "Bankers' Credit." Congress also included a provision authorizing the delivery of \$10,147,000 of the new bond issue to certain Cuban railroads to cover the government's debt to these carriers. It was widely charged that large-scale bribery of Congressmen by the railroads brought about the inclusion of the latter provision in the bill at the last moment. President Laredo Bru vetoed the measure because of the inclusion of the payment to the railways but Congress repassed it over his veto. A deficit of \$200,000 in the accounts of the House of Representatives was also attributed to corruption among House officials. Colonel Batista as well as the public was reported displeased with the subordination of legislative action to partisan struggles among the four parties represented in Congress for political sinecures and favors.

Criticism on all these counts led to the resignation of Antonio Martínez Fraga, president of the House, on August 2, of the entire Cabinet on August 8, and of Guillermo Alonso Pujol, president of the Senate, on August 30. The new cabinet announced by President Laredo Bru on August 10 included seven holdovers from the previous cabinet and six new members. Three of the latter were classified as sympathizers with Dr. Grau San Martín's Cuban Revolutionary party, a circumstance viewed as a rebuff by Batista to the older political parties. Batista meanwhile held conferences with leaders of the outlawed revolutionary groups and won their promise to abandon their militant opposition in return for permission to participate on an equal basis in the forthcoming Constituent Assembly elections. To the surprise and dismay of the older political parties and conservative elements, the provincial government of Havana Province on September 13 authorized the legal registration of the previously outlawed Communist party. Registration of a Cuban Nazi party, pledged to fight communism, followed on September 29. On October 20 the government granted legal status to *Joven Cuba*, the radical revolutionary group responsible for widespread anti-government terrorism in preceding years, and also a National Fascist party, newly organized on the Italian model.

On December 9 Former President Ramón Grau San Martín, who had been in exile at Miami, Fla., for four years, returned to Cuba to lead his Cuban

Revolutionary party in the forthcoming elections. He was followed on December 24 by Orestes Ferrara, Secretary of State in the deposed Machado Government, who had been in exile since Machado's overthrow. Ferrara said he would resume his political career as head of the Liberal party.

Batista also expressed his Leftist policy by an outspoken advocacy of democracy, repeated manifestations of sympathy and fraternity toward the Cárdenas regime in Mexico, and his support of advanced labor legislation. These tendencies by the island's "strong man" aroused alarm among conservatives, an alarm expressed in a series of questions addressed to Colonel Batista by José I. Rivero, director of the *Diario de la Marina*. Batista answered them at length in a letter published October 21, in which he flatly repudiated "Stalinism" and declared that his regime had no intention of following the Mexican policy of confiscating foreign properties or of weakening Cuba's many ties with the United States.

Despite his new Leftist policy, Batista displayed his unwillingness to tolerate criticism of his regime. *La Prensa*, official organ of the opposition Republican party, was closed by army authorities September 1 for announcing that Batista planned to dissolve Congress and head a provisional government. The Senate on September 6 passed a resolution protesting this action as "contrary to the Constitution and the laws in force." Batista promptly got around this legal difficulty by having President Laredo Bru sign a decree establishing a legal procedure for closing publications in case they attacked "the honor of persons, the social order or public tranquillity." Regulations for censorship of radio commentaries of all kinds were established by the decree of April 11.

Legislation, etc. The amnesty bill for common criminals approved by Congress late in 1937 was vetoed by President Laredo Bru on Jan. 10, 1938, as being too broad in scope. A second bill was passed by the House on July 5 and by the Senate on August 4. It freed about half of the prisoners convicted and awaiting trial and provided substantial reductions in sentences of the remainder. The division of state lands among peasants, approved by Congress on Dec. 17, 1937, was carried forward on a small scale during 1938 under the supervision of the military authorities. A decree regulating contracts between employers and employees indirectly excluded labor union officials from participating in the negotiations on such contracts. A law approved May 4 provided for rigid state control over the exploration and exploitation of petroleum and other hydro-carbons.

There was a steady deterioration in economic conditions during the summer and fall, reflected in growing political unrest and intensification of the government's financial difficulties. Despite protests by commercial and industrial concerns, a series of new or increased taxes were laid in a budget-balancing bill passed by Congress June 23. The government on August 18 announced a 17-point program to check the economic crisis. It included a \$6,000,000 public works program to be financed through a 10 per cent reduction in governmental expenditures; the deportation to their places of origin of 50,000 laborers from other West Indian islands; restriction of further immigration; further regulation of wages and of employer-worker relations; prosecution of tax evaders and profiteers; elimination of illegal commercial competition; and the regulation of prices of basic commodities. Other government measures were necessary to check the

decline in the peso exchange rate caused mainly by a proposed 20,000,000 peso expansion in currency circulation.

Foreign Relations. The close relations developed between Cuba and Mexico during 1938 were marked by the open sympathy expressed by the Cuban laboring masses and radical elements for Mexico's socialistic program and expropriation of foreign-owned oil properties. A Mexican Cultural Mission visited Cuba in June. The Mexican Minister to Cuba seized the opportunity presented by the attending ceremonies to urge the nationalization of foreign-owned sugar mills, railroads, and public utilities in Cuba. This proposal was seconded by many Cuban labor and Left-wing organizations.

Batista's sympathetic response to the Mexican overtures was indicated by his action in sending a large mission representing both the civil government and the military, naval, and air forces to Mexico City to take part in the Mexican Independence Day celebration. A resolution characterizing the sending of this mission as an affront to the United States and asking the President to explain the reason for the gesture and to define his government's ideology was rejected by the House of Representatives on October 4, 57 to 54. On October 31, shortly after Colonel Batista had accepted an invitation to attend the Armistice Day ceremonies in Washington, it was announced that he had also accepted an official Mexican invitation to visit that country in January, 1939.

The sympathy displayed toward Mexico did not prevent sincere expressions of Cuban friendship for the United States, although it was significant that these expressions came more from the conservative middle class and business interests than from the laboring masses. A decree making July 4 an official holiday in Cuba was signed by the President July 1 and on the American Independence Day a great celebration was organized in Havana by cultural, social, economic, and patriotic groups. A pro-American group, the *Acera del Louvre* Committee, which sponsored the July 4 parade, also launched a campaign for the modification of nationalistic legislation that served to restrict American political, cultural, and economic contacts with Cuba. As a step in this direction President Laredo Bru on September 6 signed a decree exempting United States citizens who were members of the American Legion from the effects of the Labor Nationalization Law of 1933.

During the September crisis over Czecho-Slovakia, Colonel Batista told an Associated Press correspondent that "if war cannot be avoided, Cuba will be at the side of the United States, whatever the policy of that great nation." During his visit to Washington and New York, Batista reiterated his support of President Roosevelt's "good neighbor" policy and his friendship for the United States. He arrived in Washington November 10, participated in the Armistice Day ceremonies, talked with President Roosevelt and Secretary Hull, and then visited New York City and West Point, where he was honored and entertained by official and private agencies and organizations. He promised the Committee for Political Refugees in New York that Cuba would aid in providing a haven for Jewish refugees from Germany. This pledge was fulfilled in a decree issued by President Laredo Bru, November 22, facilitating the entrance of Jewish refugees into Cuba.

Upon his return to Havana on November 25, Batista received a tremendous ovation. He an-

nounced that the reciprocity treaty with the United States would be modified to benefit certain Cuban products and indicated that he had received promises of financial assistance for the island and arranged for closer military co-operation. On November 29 he stated that an oral agreement reached at Washington called for the reduction of the United States duty on Cuban sugar. In return, he said, Cuba was to eliminate her tariffs on Louisiana rice and other United States agricultural and manufactured products. Certain exemptions were also to be granted American citizens in Cuba from the republic's nationalistic labor legislation. The State Department at Washington announced that no promise of a reduction of the sugar tariff had been given. However, it fixed Jan. 3, 1939, as the date for opening hearings on a revision of the Cuban-United States reciprocal treaty to give Cuba additional concessions on sugar, rum, tobacco and tobacco products, and potatoes. It was learned on December 2 that the United States Navy had extended the area of the base at Guantanamo Bay. On December 5 the Cuban Ambassador at Washington announced that the Export-Import Bank would lend Cuba \$50,000,000, apparently for public works.

CUMBERLAND PRESBYTERIAN CHURCH. One of the Presbyterian bodies whose chief strength is in the Southern States. It was formed in 1810 when the so-called anti-revival party of the Presbyterian Church in the United States of America objected to the admission into the ministry of men who were not up to the usual literary and theological standards, and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith.

A general assembly which meets annually is the supreme judiciary; its 1939 meeting will be held in Marshall, Mo., June 15-21, 1939. In 1938 there were 1096 churches reporting 790 ministers and a church membership of 70,539, in the denomination's 10 synods and 64 presbyteries. The Sunday school enrollment was approximately 55,000. The property of the church was valued at \$4,152,000, not including a \$500,000 endowment for education.

Missionary work is carried on among the Indians in the United States, in China, and South America. The denomination maintains Bethel College and the Cumberland Presbyterian Theological Seminary, both in McKenzie, Tenn. Its official organ is the *Cumberland Presbyterian*. Judge D. D. Dowell, Hardinsburg, Ky., was moderator of the general assembly in 1938 and the Rev. D. W. Fooks, of Nashville, Tenn., was stated clerk, treasurer, and general secretary.

CURRENCY. See COINS, VALUE OF; FINANCIAL REVIEW; INTERNATIONAL BANKING; MONEY; UNITED STATES.

CURAÇAO, kōō'ra-sā'ō; kūr'a-sō'. A colony of the Netherlands comprising two groups of islands about 500 miles apart: (1) Curaçao, Bonaire, Aruba, just north of Venezuela; (2) St. Martin (southern part), St. Eustatius, Saba, just west of the Virgin Islands. Total area, 403 square miles; population (Dec. 31, 1936), 90,870. Willemstad (capital) on Curaçao had 28,350 inhabitants.

The chief products are maize, beans, pulse, salt, phosphate of lime, and cattle. Oil refining is the main industry. In 1938 enlargement programs of oil refineries in Curaçao and Aruba, costing over \$30,000,000, were inaugurated. In 1937 exports of natural phosphates totaled 102,000 metric tons. In 1937 the estimated value of general imports (in old U.S. gold dollars) was \$96,400,000 (1936, \$75,-

200,000); exports, \$89,500,000 (1936, \$76,900,000).

In 1937 there were the following airplane services in operation: (1) From Aruba to Curaçao; (2) from Aruba and Curaçao to Maracaibo, Venezuela; (3) from Curaçao to Guaira and Caracas, Venezuela. In 1936, 12,057 vessels (57,924,179 cubic meters) entered the ports of Curaçao. In 1937 there were 316 miles of roads. The budget for 1936 indicated revenue of 7,969,000 guilders and expenditure of 7,964,000 guilders (guilder averaged \$0.6448 for 1936). The colony is administered by a governor, aided by a privy council of 4 members and a colonial council of 13 members all nominated by the Queen. Governor, G. J. J. Wouters (appointed, Apr. 7, 1936).

CYCLING. See SPORTS.

CYCLOTRONS. See PHYSICS.

CYPRUS. A British crown colony in the eastern Mediterranean. Area, 3572 square miles; population (1937 estimate), 370,935 as compared with 347,959 (1931 census). The larger part of the inhabitants are of the Orthodox Greek-Christian faith, and a little more than one-fifth are Mohammedans. During 1937 there were 10,954 births, 6334 deaths, and 3012 marriages. The chief towns are Nicosia (capital), 23,677; Limassol, 15,349; Larnaca, 11,872; Famagusta and Varosha, 9979; Paphos, 4517; Kyrenia, 2137. For primary education there were 716 schools with a total of 45,161 pupils enrolled in the school years 1936-37. Secondary education was given in 24 schools.

Production and Trade. The principal agricultural products (with 1937 production figures) are wheat (2,139,687 kilés; kilé equals 8 Imperial gallons), barley (2,147,919 kilés), carobs (63,011 tons), olives and olive oil (estimate, 16,148,559 okes; oke equals 2.8 pounds), cotton (50,041 cwt.), tobacco (26,739 okes), potatoes (estimate, 608,634 cwt.), cumin seed, citrus fruit, grapes (estimate, 24,000,000 okes).

Livestock in the colony (1937) totaled 641,536 including horses, mules, donkeys, camels, oxen, pigs, cattle, sheep, and goats, but excluding lambs and kids. Sponge fishing is a minor industry. Pyrites (cupriferous), asbestos, chromite, gypsum, and terra umbra are the chief minerals. In 1937 there were 2562 miles of roads. In the same year, 11,546 tourists visited Cyprus. Imports in 1937 (exclusive of specie) were valued at £2,219,429; exports, £2,180,048, of which minerals accounted for £1,128,000.

Government. For 1937 revenue (exclusive of grant-in-aid, £92,800) totaled £967,960; expenditure (exclusive of £92,800, the Cyprus share of the Turkish Debt charge), £845,038; public debt, £615,000. Expenditure for 1938 was estimated at £908,888. Because of the riots of 1931 (see NEW INTERNATIONAL YEAR BOOK, 1931), the legislative council (but not the executive council) was abolished by Letters Patent of Nov. 12, 1931, and the governor was granted the power to legislate. During October of 1933 an advisory council, on an informal basis, was established. This advisory council includes the executive council (of six members) and members annually selected from the unofficial community (six members in 1937). Governor, Sir Herbert Richmond Palmer (appointed, October, 1933).

History. In 1938 a button factory was opened at Limassol, cut dom nuts from the Sudan being used in the manufacturing process. An airport at Larnaca was in course of construction during the year.

CYRENAICA. See LIBYA.

CYRIL VLADIMOROVITCH. A Russian Grand Duke and pretender to the throne of Rus-

sia, died in Paris, Oct. 12, 1938. Born at Tsarskoïe-Sela, Russia, Sept. 30, 1876, the son of the Grand Duke Vladimir Alexandrovitch and of Marie Pavlovna, the Duchess of Mecklenburg-Schwerin, he was educated for the navy at the Naval Cadet College and rose to the rank of captain. He was a staff officer on the battleship *Petropavlovsk* when it was torpedoed on Apr. 13, 1904, during the Russo-Japanese War, and he and his brother Boris were among the few survivors.

His marriage, in 1905, to the Grand Duchess Victoria, a granddaughter of Queen Victoria of England, sister of Queen Marie of Rumania (q.v.), and divorced wife of the Grand Duke of Hesse Darmstadt, the brother of the Czarina, led to his being stripped of his commands and titles and banished from the Court. In 1908 a reconciliation between him and the Royal Family was effected and he returned to Russia.

Cyril belonged to the so-called liberal branch of the Romanoff family, and in 1916 he advised the Czar to rid himself of Rasputin's influence and to make certain reforms. When the Revolution broke out on Mar. 12, 1917, and the Czar abdicated, Cyril, who was an admiral and commander-in-chief of the Imperial Maritime Guard, pledged his loyalty to the new government. After the downfall of the Kerensky provisional government, however, he and his family fled to Germany and settled at Coburg. There on Aug. 8, 1922, he issued a manifesto proclaiming himself head of the Romanoff dynasty and, although this met with opposition by many of the White Russians who contended that he was not the rightful heir to the throne, two years later, Aug. 31, 1924, he proclaimed himself "Emperor of all the Russias." He removed his "court" to France in 1930.

CYTOLOGY. See BOTANY.

CZECHO-SLOVAKIA, čěč'ô-slô-vá'kí-â. A Central European republic, established Oct. 28, 1918. Capital, Praha (Prague).

Area and Population. The area and population, by Provinces, at the census of 1930 and as estimated on Jan. 1, 1938, are shown in the accompanying table.

CZECHO-SLOVAKIA: AREA AND POPULATION

Province	Area, sq. miles	Population	
		1930	1938
Bohemia	20,101	7,109,376	7,252,000
Moravia and Silesia	10,351	3,565,010	3,645,000
Slovakia	18,921	3,329,793	3,551,800
Ruthenia	4,871	725,357	814,600
Total	54,244	14,729,536	15,263,400

By the territorial cessions made to Germany under the Munich accord of Sept. 29, 1938, and to Poland and Hungary under subsequent agreements (see *History*), the area of Czecho-Slovakia was reduced to 38,180 square miles and the population to 9,807,096. The racial division of the 1930 population was: Czecho-Slovaks, 9,756,604; Germans, 3,318,455; Magyars, 719,569; Ruthenians, 568,941; Jews, 204,779; Poles, 100,322; others, 60,876. Estimated populations of the chief cities were: Praha (Prague), 962,200 in 1937; Brno (Brünn), 291,800 in 1937; Moravská Ostrava, 178,099 in 1935; Bratislava (Pressburg), 170,668 in 1935; Plzeň (Pilsen), 124,353 in 1935; Liberec (Reichenberg), 68,808 in 1935; Košice (Kaschau), 81,400 in 1937; Olomouc (Olmütz), 69,900 in 1937; Usti nad Labem (Aussig), 72,393 in 1935. Living births in 1937 numbered 262,526 (17.2 per 1000); deaths, 202,359 (13.3); marriages, 126,298 (8.3).

Education and Religion. About 3.2 per cent of the adult population are illiterate. School attendance is compulsory for children from 6 to 14 years of age. The school attendance in 1936-37 was: Primary, 2,343,655; secondary (1935-36), 417,830; advanced technical schools and universities, 28,257. The division of the population by religious faiths at the 1930 census was: Roman Catholics, 10,831,696; Greek and Armenian Catholics, 585,041; Protestants, 1,129,758; Orthodox, 145,598; Jews, 356,830; Old Catholics, 22,712; other faiths, 9878; professing no religion, 854,638.

Production. At the 1930 census 34.6 per cent of the working population was engaged in agriculture, forestry, and fishing; 34.9 per cent in industries and small trades; 13 per cent in commerce, banking, and transportation; 5.4 per cent in the public service and the army; and 10.7 per cent in miscellaneous occupations. Arable land in 1937 comprised 41.7 per cent of the total area; 16.6 per cent was permanent meadow and pasture and 32.6 per cent forests. The wholesale value of agricultural production in 1935 was 17,913,000,000 crowns. Yields of the chief cereals in 1938 were (in metric tons): Wheat, 1,788,300; barley, 1,298,000; rye, 1,680,000; oats, 1,270,000; corn, about 250,000. The sugar-beet harvest in 1937 was 5,987,000 metric tons; beet-sugar production (1937-38), 727,000 metric tons; hops, 25,852,000 lb.; wine, 14,403,000 gal.; hemp, 10,594,000 lb.; flax, 24,361,000 lb.; tobacco 32,871,000 lb.; fodder beets, 5,166,000 metric tons; alfalfa, clover, and esparcet, 3,732,000 metric tons. Livestock statistics for Jan. 1, 1938, were: Cattle, 4,930,000; swine, 3,611,000; sheep, 642,000; goats, 1,115,000; horses, 704,000 (1937).

Industrial production for 1937 was (in metric tons): Coal, 16,952,000; lignite, 18,046,000; coke (from coal), 3,272,000; iron ore, 1,817,000; pig iron, 1,675,000; steel ingots and castings, 2,317,000; manganese ore, 106,294; salt, 181,483. The output of beer in 1937 was 216,839,000 gal.; alcohol (1936-37), 26,426,000 gal.; rayon, 8,693,000 lb. The net imports of raw cotton in 1937 were 242,874,000 lb. Textiles, shoes, glass, leather goods, and many other articles are produced on a large scale.

Foreign Trade. Imports for consumption were valued at 10,965,334,000 crowns in 1937 (7,894,444,000 in 1936) and exports of Czecho-Slovak products at 11,952,693,000 crowns (7,996,516,000 in 1936). The chief 1937 imports in order of value were raw cotton, wool, machinery, iron ores, petroleum products, and oilseeds. The principal exports were iron and steel manufactures, machinery, iron and steel (forged, rolled, drawn), glass and glassware, cotton and wool textile fabrics, knit goods, arms and explosives, and wheat. Of the direct consignments received by Czecho-Slovakia in 1937, Germany supplied 15.5 per cent, United States 8.8, United Kingdom 6.4, France 5.2, and Austria 4.2 per cent. Of the 1937 domestic exports, Germany purchased 13.7 per cent, United States 9.3, United Kingdom 8.6, Austria 7.3, and Yugoslavia 5 per cent.

Finance. For the calendar year 1937 actual budget receipts totaled 13,928,768,843 crowns (ordinary, 8,962,808,435; extraordinary, 4,965,960,408) and actual expenditures were 13,919,892,763 crowns (ordinary, 8,835,376,680; extraordinary, 5,084,516,083). The surplus was 8,876,080 crowns, as against a deficit of 1,398,714,380 crowns in 1936. The 1938 budget estimated total receipts at 10,120,000,000 and expenditures at 10,117,000,000 crowns. The public debt on Dec. 31, 1937, amounted to 47,094,400,000 crowns (preliminary), of which 38,-

842,800,000 crowns represented the domestic and 8,251,600,000 crowns the foreign debt. The average exchange rate of the crown was \$0.0401 in 1936, \$0.0346 in 1937, and \$0.0347 in 1938.

Transportation. On Jan. 1, 1936, there were 6968 miles of state-owned railways, 1266 miles of privately owned lines operated by the state, and 140 miles privately owned and operated. In 1937 railways owned or operated by the state carried 268,738,000 passengers and 72,501,000 metric tons of freight. The gross receipts totaled 4,296,000,000 crowns. Highways of all descriptions in 1937 extended 43,564 miles; number of automobiles, 107,629. Civil aviation statistics for 1937 were: Miles of line, 10,706; miles flown, 2,267,000; passengers carried, 45,871; mail carried, 193,659 lb.; freight carried, 2,584,000 lb. There was a heavy freight traffic on the Danube, Vltava (Moldau), and Elbe rivers.

Government. The Constitution of Feb. 29, 1920, established a democratic republic with executive power vested in a President, elected for seven years by the two chambers of Parliament in joint session. The cabinet was appointed and recalled by the President but was responsible to Parliament. Legislative authority rested in a Senate of 150 members elected for eight years and a Chamber of Deputies of 300 members, elected for six years. President at the beginning of 1938, Dr. Eduard Beneš, elected Dec. 18, 1935. Premier, Dr. Milan Hodza (Czecho-Slovak Agrarian), heading a coalition government including the Czecho-Slovak Agrarian, Czecho-Slovak People's Catholic, Czecho-Slovak Social Democratic, German Agrarian, German Social Democratic, German Christian Socialist, Czecho-Slovak Trades, and Czecho-Slovak National Socialist parties. For developments during 1938, see *History*.

HISTORY

The German drive to eliminate Czecho-Slovakia as a barrier to the Reich's eastward expansion, launched in 1937 (see 1937 YEAR BOOK, pp. 201-202), attained phenomenal success in 1938. Deserted by her allies and threatened with immediate invasion, despairing Czecho-Slovakia capitulated to German armed might on September 30 and surrendered German-speaking Sudetenland. With it went the historic Bohemian frontier, the strategic mountain bastions and chain of expensive fortifications defending the republic, and a large proportion of its natural resources and industries. Cession of the Sudetenland was followed by the forced transfer of other extensive frontier territories to Poland and Hungary, likewise under threat of immediate military invasion.

In all, Czecho-Slovakia lost 16,056 square miles of territory with 4,922,440 inhabitants, or nearly one-third of her total area and population. According to the official Czech compilation, Germany obtained 11,071 square miles of territory with 3,653,292 inhabitants, Poland 419 square miles with 241,698 inhabitants, and Hungary 4566 square miles with 1,027,450 inhabitants. Czecho-Slovakia ceded 1,161,616 Czechs and Slovaks and 36,880 Ruthenians as well as 2,853,858 Germans, 591,544 Hungarians, 77,580 Poles, 60,332 Jews, and 17,587 others. Incapable of defense, with her main railways and roads cut and her economic structure disrupted, Czecho-Slovakia became a vassal of Germany, both politically and economically. The former centralized democratic republic was transformed into a Federation of three largely autonomous quasi-totalitarian regions, all controlled from

Berlin. Bitterly disillusioned by what they considered their gross betrayal by France and Britain, the Czecho-Slovaks renounced the policies of Masaryk and Beneš and proclaimed "selfishness" as the guiding principle of their mutilated state.

Hitler's Threat. The opening of 1938 found President Beneš and Premier Hodza engaged in negotiations for a settlement of the grievances voiced by the pro-Nazi Sudeten German party led by Konrad Henlein (see 1937 YEAR BOOK, p. 201). The German press was continuing its violent attacks upon the Prague Government for its alleged "barbarous provocation" of the Sudeten Germans. In his Reichstag speech of February 20, Chancellor Hitler forecast the more active intervention of the German Government in the Sudeten question by declaring that "present-day Germany will know how to represent and protect . . . those German racial comrades on our borders who are not in a position by themselves to secure general human, political, and *weltanschaulichen* freedom." Field Marshal Goering made a more pointed threat on March 1 when he called upon his air force to support to the end Hitler's "proud statement that we would no longer tolerate that 10 million of our German brothers across the frontier should be oppressed."

However, this implied threat to Czecho-Slovakia was disclaimed during the subsequent European crisis precipitated by Germany's absorption of Austria (q.v.). On the eve of the Austrian invasion of March 12, the Reich Government inquired whether Czecho-Slovakia would mobilize and was informed that it would not. At that time the Nazis disclaimed any intention of attacking Czecho-Slovakia or mixing in her internal affairs. But once Austria was safely in the German fold, Hitler's attitude toward Czecho-Slovakia again became threatening.

Effects of Anschluss. Czecho-Slovakia's position was greatly weakened as a result of Austro-German union. The republic was now open to German attack from the south, where its frontier defense system was weak. Germany was in a position to bring great economic pressure upon the republic now that it controlled Czecho-Slovak trade outlets into Austria. More important still, the Nazi triumph in Austria greatly stimulated Nazi sentiment among the Sudeten Germans, producing a virtual stampede into Henlein's Sudeten German party. The German Agrarian League and the German Christian Socialist party merged with Henlein's movement on March 22-23, making it the largest single group in the Czecho-Slovak Parliament, with 55 seats in the Chamber of Deputies. To check the defection of its supporters to Henlein, the German Social Democratic party withdrew from the government coalition but remained an independent movement.

Henlein, who now claimed to represent about 90 per cent of the German-speaking voters, called for new elections. At the same time (March 29) his deputy leader in the Chamber of Deputies, Ernst Kundt, warned the government to grant full autonomy to all minorities. This demand was echoed by the United Magyar (Hungarian) parties, the Slovak People's party, and the representative of the Polish minority.

Reich's Intervention Rejected. Meanwhile, Premier Hodza on March 4 had announced that his government would regard German intervention in the Sudeten question as an unwarranted intervention in its domestic affairs and that if attacked Czecho-Slovakia would defend herself. In response to inquiries, the French Government on February

27 and March 14 gave Czecho-Slovakia assurances that it would fulfill its obligation under the treaty of Oct. 16, 1925, by going to Czecho-Slovakia's aid in case of unprovoked aggression by Germany. On March 16 the Soviet Government pledged its aid under the Soviet-Czech mutual assistance treaty of May 16, 1935, which made such aid conditional upon simultaneous French assistance to Prague.

The weak link in this international opposition to German aggression upon Czecho-Slovakia was revealed by Prime Minister Chamberlain's statement of British foreign policy in the House of Commons on March 24. He refused to pledge British aid to Czecho-Slovakia in case of a German attack or to guarantee support of France if she went to Czecho-Slovakia's aid in fulfillment of her treaty obligation. At the same time he warned Germany that Britain might intervene as a League member. This speech confirmed the Nazi leaders in their belief that Britain would not intervene. It also encouraged the campaign launched by a section of the French press demanding repudiation of the Czecho-Slovak alliance. At the London conference between Premier Daladier and Foreign Minister Bonnet, of France, and British Cabinet officials on April 28-29, the British apparently influenced the French to reduce their commitments to Czecho-Slovakia in return for a closer Franco-British defensive alliance. Chamberlain recommended concessions by Prague to the Sudeten Germans and stated that Britain could undertake no further economic and political commitments on the continent until Czecho-Slovakia's minority problems had been solved. Britain and France then joined in urging Prague to make all concessions "compatible with the security of the state."

Czech-Sudeten Negotiations. Fully alive to the danger from Germany, the Prague Government had already sought to check the Nazi agitation by offering to grant further concessions to the German and other minorities. On March 18 the Cabinet decided to grant the Sudeten districts further economic benefits and political rights in accordance with the principle of "proportionalism" among the various racial groups adopted in 1937. In particular, the privileged status of the Czech language as against German was modified. On March 28 the government announced its intention to codify in a single "nationalities statute" all of the legal provisions in force affecting minorities, and to grant additional powers to local administrative bodies.

On March 31 Premier Hodza agreed that the municipal elections, postponed due to Nazi demonstrations and disorders the previous October, should be held in May and June. At the same time he prohibited for a month the Nazi political demonstrations that were stirring up growing disorders in the German districts. At Karlsbad on April 24, Henlein declared that the Czechs could achieve friendly relations with the German nation only by "revising" the foreign policy based on pacts with the Soviet Union and France, and "the unfortunate conception that it is the duty of the Czech nation to be the Slav bulwark against the so-called German *Drang nach Osten*." Moreover, he laid down eight conditions, known as the Karlsbad demands, necessary to insure "a peaceful development in the Czecho-Slovak state." They included home rule for the Sudeten Germans in their own territory; new safeguards against their denationalization; full restitution for injustice done to Germans by Czechs since 1918; and full liberty for Sudeten Germans to express the "fundamental

National Socialist view of life." The Reich Government immediately made known its support of these demands.

The Prague Government flatly rejected the demand for territorial autonomy and for restitution for post-war injustices, which it considered equivalent to handing over part of its territory to Germany and accepting German domination of Czech-Slovak foreign policy. Henlein and his adherents, strengthened by German support, refused to discuss a settlement of their grievances on any other basis. The British and French intervened to break this deadlock, which already threatened Europe's peace. They pressed Prague to make more concessions. At the same time they warned the Reich that "rough handling" of the Sudeten issue might precipitate war and urged moderation of Henlein's demands.

The May Crisis. The Anglo-French representations had little if any effect. Nazi propaganda, apparently directed from Berlin, raged throughout the Sudetenland. On May 7 the Prague Government lifted the ban on political meetings and demonstrations to permit the holding of municipal elections on May 22, May 29, and June 12. This was the signal for Nazi attacks upon Czech troops and gendarmes in the Sudeten regions, a tactic apparently designed to force their removal from "German soil." Henlein on May 13 organized a party militia, similar to the Hitler Storm Troops, which took part in the rising campaign of intimidation against both Czechs and German Social Democrats in the Sudeten regions. On May 17 German workers at Liebig appealed to President Beneš for protection against Nazi excesses.

At this juncture reports of German troop concentrations along the Czecho-Slovak frontier aroused apprehension throughout Europe. The German Government described them as routine. On May 20 the Czech Minister at Berlin inquired whether they were directed against his country. He was informed that they were not but that if Czecho-Slovak policy was not altered Germany would march to "rescue" the Sudeten Germans. This threat, coupled with growing disorders in Sudetenland, led the Prague Government on the night of May 20 to mobilize one class of reserves along the German frontier and to announce that it would suppress every attempt at coercion or disorder. This action restored Prague's authority in the Sudeten regions and gave emphatic notice that the republic was prepared to defend itself against invasion.

The accompanying war scare was marked by renewed British efforts to avert an armed clash. The French Government again declared it would aid Czecho-Slovakia if the latter were attacked but pressed Prague to make further concessions to the German minority. Hitler, on May 29, ordered a drastic increase in the army and air force and rapid completion of fortifications along the French frontier. The crisis apparently convinced him that his aims in Czecho-Slovakia could not be achieved without war or a more serious threat of war.

Czech-Sudeten Negotiations Renewed. Henlein's Sudeten German party won from 82 to 85 per cent of the German vote in the communal elections, according to Czech estimates, and over 90 per cent according to its own claims. It delayed further negotiations with Prague on the Karlsbad demands pending the withdrawal of Czech troops from the Sudetenland, but was finally induced through British efforts to submit concrete proposals to the Czech authorities for the settlement

of its grievances. The Henleinist memorandum of June 7 demanded that Czecho-Slovakia be subdivided into virtually independent racial areas, each having an equal voice in the affairs of the central government.

To the Czechs, this meant the establishment within the republic of a Nazi state directed from Berlin. Premier Hodza rejected territorial autonomy but accepted part of the Henlein proposals as a basis for discussion. Round-table conferences between members of the Prague Cabinet and Sudeten German representatives began on June 23. The autonomist Slovak People's party and the United Magyar parties associated themselves with the Sudeten German demand for larger powers of self government, although not with the specific Sudeten German proposals. On June 30 the Prague Government made public bills granting the minorities greater language rights and proportionality in state employment. No agreement could be reached on the crucial issue of home rule, however, and Prague authorities intimated that they would put their own home-rule proposals into effect if the impasse was not broken.

The Runciman Mission. On July 9 Henlein went to Germany to confer with Hitler. Immediately afterward the German attitude toward Czecho-Slovakia again became threatening. The Nazi press and radio unleashed a torrent of abuse and denunciation of alleged Czech and Bolshevik atrocities against innocent and defenseless Germans in the Sudetenland. British Cabinet officials began to display fear of a new European crisis. Premier Daladier on July 12 again stated that France would honor her solemn obligation to Czecho-Slovakia if the latter were attacked. But in European chancellories the belief spread that in the approaching show-down Britain would refuse to support France and that the Paris Government would feel too weak to act alone.

Hitler's personal aide, Captain Wiedemann, interviewed the British Foreign Secretary, Lord Halifax, in London on July 18, the eve of the visit of the British King and Queen to France. Lord Halifax immediately afterward asked the Prague Government to accept British mediation in the Sudeten question, the implication being that if the offer was rejected Britain would wash her hands of the whole Czecho-Slovak question. Prague accepted, and on July 26 Prime Minister Chamberlain announced that he was sending Lord Runciman to Czecho-Slovakia in an unofficial capacity to investigate, and, if possible, to mediate the minorities issue.

Before Lord Runciman's arrival on August 3, the Prague Government announced its preliminary program for settlement of the minorities' grievances. This called for considerable transfer of power from Prague to the provincial assemblies, which were to become Diets, and to local administrative bodies. Representatives of each nationality in each provincial Diet were authorized to deal with certain affairs of their respective national groups. But in none of the Diets could the Germans, Hungarians, or Poles hope to control a voting majority. Negotiations on the basis of this program proceeded slowly during July and August. There were differences of opinion within both the Hodza Cabinet and the Sudeten German party as to the extent of the concessions to be made. The Prague Government at the same time attempted to deal separately with the demands of the Slovak and Ruthenian autonomists.

When the Czech-Sudeten German negotiations

broke down on August 17, Lord Runciman persuaded President Beneš on August 21 to agree to further concessions. A scheme for cantonal self-government was worked out by Lord Runciman and his advisers in consultation with the President and submitted to Henlein on August 28. By this time the German-Czech quarrel had again assumed critical proportions. Early in August the Reich had begun military measures that aroused new fear throughout Europe. Reservists were called up for annual army maneuvers on an unprecedented scale, beginning August 15. The regular term of recruits expiring October 1 was extended. Thousands of laborers were conscripted for work on the western fortifications. Decrees for the conscription of civilian goods and services were issued.

In the middle of August the British Ambassador at Berlin inquired as to the purpose of these measures and pointed out that they might not only prevent successful mediation by Lord Runciman but "perhaps endanger the peace of every one of the Great Powers of Europe." Refusing to discuss the military measures, Foreign Minister Ribbentrop declared that Lord Runciman's efforts at Prague "had only served to increase Czech intransigence." It became evident that Hitler was preparing for a show-down and that Henlein was merely his intermediary in the negotiations at Prague.

In these circumstances, Lord Runciman wrote a letter urging Hitler to approve the Czech plan of August 28 for cantonal self-government which Henlein delivered to the Chancellor at Berchtesgaden on September 1. Henlein returned with an unfavorable reply, but stated his conviction that Hitler desired "a peaceful solution." The Czech authorities then submitted a final proposal to the Sudeten German party on September 6. This went far toward meeting the Sudeten demand for self-government. It called for the division of the republic into cantons delimited by nationality frontiers, each having a legislature elected by proportional representation. The cantons were to be autonomous in all matters not affecting the unity and security of the state and national sections were to be created in administrative departments of the central government. The proportionality principle was to be observed in state employment, education, social welfare, public health, and state contracts. In addition a billion-crown loan was to be raised for relief of the distressed regions, of which 70 per cent would go to German districts, and the minority languages were to enjoy complete equality with Czecho-Slovak in official matters.

Lord Runciman declared that this plan "embodied almost all the requirements of the Karlsbad eight points." But it was immediately rejected by the German press and Czech efforts to continue the negotiations were foiled by further incidents in the Sudetenland which, according to Lord Runciman, were provoked by Sudeten extremists.

The Sudeten Revolt. The extremely violent Nazi and anti-Czech propaganda that had raged for months throughout the Sudeten districts came to a climax with Hitler's speech before the closing session of the Nazi Congress at Nuremberg on September 12. He denounced President Beneš and the Czecho-Slovak Government for "persecutions" of the Sudeten Germans and went on to declare "that if these tortured creatures can find no rights and no help themselves, they will get both from us. . . ."

Hitler's speech was followed immediately by fighting between Henleinists, armed with modern German weapons, and Czech police in many Sude-

ten towns. Correspondents reported that these outbreaks were planned in advance in expectation of German intervention. But the Prague Government acted with firmness. Reinforcements were rushed to the Sudeten towns and on September 13 modified martial law was proclaimed. Henlein then demanded that Prague revoke martial law and turn over most of its authority in the German districts to his party. He broke off negotiations when the government asked that a representative be sent to the capital to discuss his terms.

Fleeing to Germany, Henlein on September 15 issued a proclamation declaring that Germans and Czechs could no longer live side by side in the same state and demanding cession of the Sudetenland to the Reich. The Prague authorities responded with a warrant for his arrest and dissolved the Sudeten German party as a subversive organization. On September 17 Henleinists who had fled across the border into Germany organized a Free Corps which, supplied with German arms, made occasional forays across the frontier and engaged in sporadic minor clashes with Czech gendarmes and troops. Lord Runciman, his mission at an end, returned to London.

Chamberlain at Berchtesgaden. Within two days after Hitler's Nuremberg speech large numbers of German troops were concentrated along the Czecho-Slovak frontier and Europe lived in fear of an immediate attack that was expected to plunge the continent into war. As early as August 26 the growing crisis had led the British to send their Home Fleet to its war base in North Scotland. After being called home for consultation on August 30, the British Ambassador at Berlin early in September repeatedly warned leading Nazi officials that Britain would probably become involved in a Central European war. The French Foreign Minister on September 4 again declared that France would remain faithful to all its pacts and treaties and on September 7 sufficient reservists were called to the colors to man the Maginot Line defenses.

Unable to obtain an unqualified pledge of support from Britain in case it went to the aid of the Czecho-Slovak army, the French Cabinet hesitated to take the strong stand against German policy dictated by French military commitments. Instead, Premier Daladier appealed to the British Government to use its influence directly with Hitler. This set Prime Minister Chamberlain free to carry out the plan he had had in mind "for a considerable period as a last resort." On September 15 he flew to Munich and went from there by train to Hitler's mountain retreat at Berchtesgaden to find out "whether there was any hope yet of saving peace."

Hitler told him that he had made up his mind the Sudeten Germans must have the right of self-determination and of joining the Reich if they wished. The Chancellor declared that if they could not achieve this by their own efforts, he would assist them. He flatly stated that rather than wait he was prepared to risk a world war. If the British Government would accept the principle of self-determination for the Sudeten Germans, Hitler said he was ready to discuss ways and means of carrying it out. Otherwise there was no use continuing the conversation. He finally agreed to postpone hostilities until Chamberlain could talk with his Cabinet, provided nothing happened in Czecho-Slovakia to force his hand.

Anglo-French Proposals. The British Prime Minister returned to London on September 16, convinced that the only hope of peace lay in the immediate cession of the Sudeten German districts of

Czecho-Slovakia to the Reich. He so informed the Cabinet meeting held September 17 and his view was supported by the report and recommendations submitted by Lord Runciman. Conferences between Chamberlain, Lord Halifax, Premier Daladier, and Foreign Minister Bonnet of France followed in London on September 18-19. There a policy of capitulation to Hitler's Berchtesgaden demands was agreed upon. On September 19 France and Britain jointly presented their proposals to the Prague authorities.

They declared that "the maintenance of peace and the safety of Czecho-Slovakia's vital interests cannot effectively be assured" without cession of those Sudeten German areas with over 50 per cent German inhabitants. It was proposed that the transfer take place without a plebiscite, that minority populations should then be exchanged, and that an international commission on which Czecho-Slovakia would be represented should delimit the new frontier. The British Government offered, in addition, to join in an international guarantee of the new boundaries of Czecho-Slovakia provided the republic terminated its military alliances with France, the Soviet Union, and the other Little Entente states. A reply to these proposals was requested at the earliest possible moment.

The Czecho-Slovak reply of September 20 was a plea for reconsideration of the Anglo-French position. It declared that the proposed partition of the republic endangered the interests not only of the republic but of its friends, its allies, and of peace in general. Such mutilation would place Czecho-Slovakia "sooner or later under the absolute influence of Germany." The resulting upset of Europe's equilibrium would have serious consequences for all other states. "In these crucial moments it is not merely the fate of Czecho-Slovakia which is at stake, but that of other nations as well, and notably that of France," the reply pointed out. It asked for application of the Czech-German arbitration treaty of Oct. 16, 1925, which Hitler had recognized as being still in effect. Finally it declared that as Czecho-Slovakia was an organized democracy, the government must consult parliament before reaching a decision.

Early on the morning of September 21 the British and French Ministers in Prague called on President Beneš and told him that if his government did not unconditionally accept the Anglo-French plan, neither Britain nor France would aid the republic against a German attack. President Beneš immediately convoked the Cabinet to consider whether the republic should face German armed might unaided. The masses of the Czech and Slovak people showed unflinching willingness to resist. The Soviet Minister at Prague and Foreign Minister Litvinov, speaking at Geneva, gave assurances that Russia would aid if France fulfilled her pledges. However, Premier Hodža's Czech Agrarian party, the largest in Parliament, favored surrender rather than the acceptance of Soviet aid.

After weighing their fateful decision all that day, the Cabinet late in the evening of September 21 announced their acceptance of the Anglo-French proposals "under extraordinary pressure" and with the belief "that the two Governments will do everything to apply them with every safeguard for the vital interests of the Czecho-Slovak state." The written reply accepted the proposals "as a whole," with the understanding that the two governments would not tolerate German invasion of the regions to be ceded until the suggested international commission had fixed the new frontiers. Government's acceptance of the Anglo-French ultimatum so embittered the Czech public that the Hodza Cabinet was forced to resign on September 22, but the new government, formed by Gen. Jan Syrový, Inspector General of the Army, did not repudiate the Hodza Government's capitulation.

Hitler's Godesberg Terms. Having obtained Czecho-Slovakia's acceptance, Prime Minister Chamberlain on September 22 flew back to Germany and met Hitler at Godesberg to discuss the technical details regarding transfer of Sudeten territory and delimitation of the new frontier. Hitler, however, declared that the Anglo-French proposals offered "too many opportunities for evasion." He demanded the immediate transfer of the predominantly German areas and refused to participate in an international guarantee of Czecho-Slovakia's new frontiers until the minority claims of Poland and Hungary had been satisfied.

Chamberlain balked at Hitler's demand that German troops should immediately occupy parts of the Czecho-Slovak republic. The following morning he wrote the Chancellor a note suggesting the postponement of the military occupation and that the Sudeten Germans be entrusted with the maintenance of law and order in the predominantly German regions until formal delimitation of the new frontier permitted "an orderly settlement of this question rather than a settlement by the use of force." Hitler replied that the existing situation in Czecho-Slovakia was "unbearable and will be terminated by me." He demanded "an end in the shortest time to the sufferings of the unhappy victims of Czech tyranny" and declared that only the withdrawal of Czech troops and German military occupation of the evacuated areas would remove grounds for "forcible action."

On September 23 Chamberlain in a second letter asked Hitler to submit his proposals in a memorandum and map, which he offered to transmit to the Prague Government at once. He received them that night during another extended conference with Hitler. They called for German military occupation of the predominantly German areas of Czecho-Slovakia on October 1. All Czech military, police, and administrative officials were to withdraw before the Germans entered, without destroying or removing existing establishments, foodstuffs, goods, cattle, raw materials, and railway rolling stock. In certain designated Sudeten areas, Hitler agreed to permit a plebiscite before Nov. 25, 1938, under control of an international commission, but Czechs who had moved into these areas since 1918 were to be excluded from voting. The Prague Government was to discharge immediately all Sudeten Germans in its military forces and to liberate all German-speaking political prisoners. A German-Czech commission was to settle all other details of the transfer. The memorandum contained no mention of the international guarantee of the new Czecho-Slovak frontiers proposed in the Anglo-French plan. Before Chamberlain left to return to London, Hitler told him that the Sudetenland was the last territorial claim he had to make in Europe and that he had no desire to include non-German peoples in the Reich.

A few hours before Hitler presented his Godesberg memorandum, the British and French Governments advised the Czechs that they "could no longer take the responsibility of advising" Czecho-Slovakia for or against mobilization. (They had previously urged Prague not to aggravate the situation by mobilizing.) Immediately afterward the Prague authorities ordered general mobilization.

Reaction to Godesberg Ultimatum. Publication of the Godesberg terms on September 25 provoked the Czechs to desperation and aroused deep indignation in Britain and France. On the same day the Prague Government "absolutely and unconditionally" rejected Hitler's demands. It announced that it would resist to the utmost, and would rely upon France and Britain to stand by it in its hour of trial. The French Cabinet on September 25 likewise decided to oppose Hitler's ultimatum. Mobilization, which had begun in part the previous day, was speeded up. That afternoon Premier Daladier and Foreign Minister Bonnet again flew to London to consult British cabinet officials. They declared that if Czecho-Slovakia was attacked France would fulfill her treaty obligations. Prime Minister Chamberlain then gave the French assurance—long sought but never before obtained—that Britain would join forces with France if hostilities with Germany ensued. Both governments rushed preparations for war.

With Hitler scheduled to make an important speech at the Berlin Sports Palace on the night of September 26, Chamberlain that afternoon sent Sir Horace Wilson by airplane to the German Chancellor with a letter asking him to agree to a German-Czech conference in the presence of a British representative regarding the method of transferring Sudeten territory. "Surely the tragic consequences of a conflict ought not to be incurred over differences in method," he wrote. Hitler told Sir Horace and the British Ambassador that he could accept no departure from his Godesberg terms. The same day Hitler received a message from President Roosevelt appealing for continuance of the negotiations with Czecho-Slovakia. But immediately before the Chancellor's Sports Palace speech, the Italian Ambassador at Berlin was informed that Germany had decided not to wait until October 1 but would march on September 28 at 2 p.m.

In his speech that evening Hitler declared his Godesberg demands were final and that if the Czechs did not yield the Sudetenland by October 1 there would be war. He gave his listeners no inkling of the danger that if war came it would involve France and Britain as well as Czecho-Slovakia. He promised to guarantee the integrity of the Czech state when the claims of other minorities had been satisfied, reiterated that "after the Sudeten German question is regulated we have no further territorial claims to make in Europe," and guaranteed the territorial inviolability against German attack of France, Poland, and all Germany's other neighbors.

On the morning after this speech, the British Prime Minister issued a statement assuring Hitler that the British Government would undertake to see the Czecho-Slovak agreement for territorial cessions "carried out with all reasonable promptitude, provided that the German government will agree to the settlement of terms and conditions of transfer by discussion and not by force." At the same time Sir Horace Wilson saw Hitler again in Berlin. Advised that Germany would march against the Czechs if they did not accept the Godesberg terms by 2 p.m. the next day, he told the Chancellor "in precise terms" that this would cause French and British military intervention. He then returned to London with a note to Chamberlain from Hitler declaring that immediate German occupation of the areas to be ceded by Czecho-Slovakia was an indispensable security measure and urging him to

"bring the government in Prague to reason at the very last hour."

September 27 also witnessed the mobilization of the British Home Fleet and of Italian armed forces. In Germany and France mobilization was already virtually completed. The same day Hitler replied to President Roosevelt, asserting that the issue of peace or war rested with Prague. That night the American President sent a second appeal to Hitler pointing out that negotiations for a peaceful settlement could be continued if the German Chancellor gave the word.

The Munich Conference. On the morning of September 28 Chamberlain sent another message to Hitler expressing certainty "that you can get all essentials without war and without delay." He offered to go to Berlin for a conference with Hitler and representatives of the Czecho-Slovak, French, and Italian governments. Again offering to see that Prague's promises were carried out, he added: "I cannot believe that you will take responsibility of starting a world war which may end civilization for the sake of a few days' delay in settling this long-standing problem." At the same time the British Prime Minister telegraphed Mussolini urging him to communicate with Hitler and support the conference proposal.

Later in the day Chamberlain gave a detailed account of the crisis to Parliament. He said he had just received word from Rome that Mussolini had persuaded Hitler to postpone action for another 24 hours. While he was speaking an invitation arrived from Hitler to confer with him, Mussolini, and Daladier at Munich the next morning. Chamberlain, Daladier, and Mussolini accepted the invitation, without objection to Hitler's exclusion of a Czecho-Slovak representative from the conference.

At 1 p.m. on September 29 the four statesmen met in the Fuehrerhaus in Munich and at 1 a.m. the following morning they signed the famous Munich accord, dated September 29, which follows:

Germany, the United Kingdom, France, and Italy, taking into consideration the agreement which has already been reached in principle for cession to Germany of the Sudeten German territory, have agreed on the following terms and conditions governing the said cession and the measures consequent thereon and by this agreement they each hold themselves responsible for the steps necessary to secure its fulfillment:

I. The evacuation will begin on October 1.

II. The United Kingdom, France, and Italy agree that the evacuation of the territory shall be completed by October 10 without any existing installations having been destroyed and that the Czecho-Slovak Government will be held responsible for carrying out the evacuation without damage to the said installations.

III. The conditions governing the evacuation will be laid down in detail by an international commission composed of representatives of Germany, the United Kingdom, France, Italy, and Czecho-Slovakia.

Occupation by stages of the predominantly German territories by German troops will begin on October 1. The four territories marked on the attached map will be occupied by German troops in the following order:

Territory marked No. 1 on the 1st and 2d of October; territory marked No. 2 on the 2d and 3d of October; territory marked No. 3 on the 3d, 4th, and 5th of October; territory marked No. 4 on the 6th and 7th of October.

The remaining territory of preponderantly German character will be ascertained by the aforesaid international commission forthwith and be occupied by German troops by the 10th of October.

The international commission referred to in Paragraph III will determine the territories in which a plebiscite is to be held. These territories will be occupied by international bodies until the plebiscite has been completed. The same commission will fix the conditions in which the plebiscite is to be held, taking as a basis the conditions of the Saar plebiscite. The commission will also fix a date, not later than the end of November, on which the plebiscite will be held.

There will be a right of option into and out of the trans-

ferred territories, the option to be exercised within six months from the date of this agreement.

A German-Czecho-Slovak commission shall determine details of the option, consider ways for facilitating the transfer of population, and settle questions of principle arising out of the said transfer.

The final determination of the frontiers will be carried out by the international commission. This commission will also be entitled to recommend to the four powers, Germany, the United Kingdom, France, and Italy, in certain exceptional cases minor modifications in strictly ethnographical determination of the zones which are to be transferred without plebiscite.

The Czecho-Slovak Government will within a period of four weeks from the date of this agreement release from their military and police forces any Sudeten Germans who may wish to be released and the Czecho-Slovak Government will within the same period release Sudeten German prisoners who are serving terms of imprisonment for political offences.

ANNEX TO THE AGREEMENT

His Majesty's Government in the United Kingdom and the French Government have entered into the above agreement on the basis that they stand by the offer contained in Paragraph VI of the Anglo-French proposals of September 19 relating to an international guarantee of the new boundaries of the Czecho-Slovak State against unprovoked aggression.

[The paragraph referred to reads: "Accordingly His Majesty's government in the United Kingdom would be prepared as a contribution to the pacification of Europe to join in an international guarantee of the new boundaries of the Czecho-Slovak State against unprovoked aggression. One of the principal conditions of such a guarantee would be the safeguarding of the independence of Czecho-Slovakia by the substitution of a general guarantee against unprovoked aggression in place of the existing treaties which involve reciprocal obligations of a military character."]]

When the question of the Polish and Hungarian minorities in Czecho-Slovakia has been settled, Germany and Italy, for their part, will give a guarantee to Czecho-Slovakia.

The heads of the governments of the four powers declare that the problems of the Polish and Hungarian minorities in Czecho-Slovakia if not settled within three months by agreement between the respective governments shall form the subject of another meeting of the heads of governments of the four powers here present.

SUPPLEMENTARY DECLARATION

All questions which may arise out of the transfer of territory shall be considered as coming within the terms of reference to the international commission.

Munich, 29 September, 1938.

Application of Munich Accord. The Munich accord gave Hitler all of the demands he presented at Godesberg with the exception of minor modifications as to the time-limit for the Czech evacuation and an added provision for exchange of population. The Czecho-Slovak Government was refused an opportunity to present its views during the conference or to make observations regarding the signed accord. The Prague authorities were asked by Prime Minister Chamberlain to give their reply by noon of September 30. With no recourse but to yield, Premier Syrový announced over the radio that afternoon: "I have taken the decision to save life and save the nation. Superior force has compelled us to accept."

The flight of Czechs, Jews, German Social Democrats, and other anti-Nazi elements from the Sudetenland began immediately. As the Czech police and troops withdrew, the Free Corps and other Nazi groups began to mop up their political opponents who had not escaped. The grim work proceeded under Henlein's instructions to show no mercy. There were some clashes between the retiring Czechs and the triumphant Henleinists. On October 1 at 2 p.m. German troops marched into the first of the ceded zones amid the welcoming cheers of the pro-Nazi population. On October 3 Hitler rode in triumph with the army into the third zone. The occupation was completed October 10 as scheduled.

The Munich accord proved to be even more drastic in actual application than in the original terms.

The international commission charged with determining the conditions of evacuation and the territories in which plebiscites were to be held was organized at Berlin. It consisted of representatives of the German Foreign Office and the Prague Government and the French, British, and Italian ambassadors. They accepted the terms dictated by Germany to Czecho-Slovakia, acquiescing in substantial modification of the Munich accord. The Czechs were "persuaded" on October 13 to dispense with plebiscites in certain areas, thus doing away with the necessity for supervision of the exchange of these territories by the international police force called for under the Munich settlement.

On November 21 the commission approved a final Czech-German frontier that gave the Reich territory additional to that agreed upon at Munich. In some of these districts the Czech residents formed a large majority. At Germany's insistence, the frontier was drawn on the basis of the Austro-Hungarian census of 1910 instead of the Czecho-Slovak census of 1930. The Czechs claimed that the new frontier gave Germany 251 communes that were predominantly Czech even in 1910. No less than 738,502 Czechs and Slovaks were handed over to the Reich, while some 400,000 Germans and German-speaking Jews remained within the new Czecho-Slovak state. In some sections of the frontier, the ethnic line was disregarded in favor of German economic and strategic interests. The new boundary completely disrupted the Czecho-Slovak transportation systems and the economic equilibrium. The Anglo-French guarantee of Czecho-Slovakia against unprovoked aggression remained wholly ineffective up to the end of 1938. Polish and Hungarian territorial claims were settled by Germany and Italy and not by another four-power conference, as provided in the Munich accord. Nor was the "right of option into and out of the transferred territories," called for in the accord, provided to those Jews and anti-Nazi Germans who wished to escape Nazi rule. Many of those who fled before the Henleinists and German troops were turned back at the new Czech frontier. Furthermore, a German-Czech agreement of November 28 authorized the Reich to expel Czechs who had settled in the annexed territories after Jan. 1, 1910, while Czecho-Slovakia was empowered to expel Germans who entered the republic after Jan. 1, 1910.

The Munich settlement also failed to relieve the new Czecho-Slovak state of the German minority problem. The 400,000 Germans remaining were given until Mar. 29, 1939, to decide whether to become German citizens. Under Nazi pressure, most of them opted to do so. On November 7 a new German Nazi movement in Czecho-Slovakia was organized under Dr. Ernst Kundt, former chairman of the Henleinist group in Parliament. In an article published late in December, Dr. Kundt declared:

We Germans of Czecho-Slovakia declare openly our allegiance not only to Germanism but also to the German Commonwealth and German National Socialism. It is the business not only of Czech politicians but the whole Czech people to recognize this fact. It is we who form a great problem for Czecho-Slovakia because behind us stand Germany and National Socialism.

Czechs remaining in the Sudetenland were permitted to opt for citizenship in Czecho-Slovakia but anti-Nazi Sudeten Germans were forbidden to do so.

German Domination. The German minority's Nazi propaganda and activities reinforced the steady diplomatic and economic pressure by which the

Reich Government converted what was left of the Czecho-Slovak republic into an economic appendage and political satellite of Germany. The Czechs, Slovaks, and Ruthenians were pushed rapidly toward fascism, anti-Semitism, and a customs union with the Reich. On October 25 the Prague authorities leveled all tariffs on products from the ceded Sudeten areas. The duty-free transport of railway passengers and freight between Austria and German Silesia through Czecho-Slovakia was agreed upon October 29. On November 21 the Prague Government gave the Reich an extraterritorial corridor to Austria through Czecho-Slovakia in which to build a military highway controlled by German police and customs guards (see the accompanying map). The two countries also agreed jointly to construct an Oder-Danube canal, supplementing the Rhine-Main-Danube canal already under construction by the German Government (see map). A tariff agreement closely linking Czecho-Slovakia with the German economic system was reported on December 16.

On December 22 the Czech authorities agreed that in return for occasional German broadcasts of Czech music, the Prague radio station would broadcast daily a four-hour German program directed by Dr. Kundt, the German Nazi leader in Czecho-Slovakia, and also rebroadcast a program from the Reich once a week. French interests on December 28 sold their 50 per cent interest in the noted Skoda munitions works to the Czecho-Slovak Government for 300,000,000 Czech crowns. Berlin sources forecast the early absorption of the Skoda factories by the German Krupp concern. The French military mission at Prague was sent home in December also. This testified to the collapse of the Franco-Czech alliance. On October 21 the Prague Government had informed the Soviet Minister that it had no further interest in maintaining the mutual assistance pact with the Soviet Union.

Poland Takes Teschen. The partition of Czecho-Slovakia at Munich was the signal for Poland and Hungary to demand immediate cession of other Czecho-Slovak territories long claimed by them. Poland had never accepted as final the division of the Teschen district in southeastern Silesia fixed by the Conference of Ambassadors on July 28, 1920. There had been growing friction between the two countries in the years preceding 1938 and when the Czech-German crisis began in September of that year, the Polish Government demanded the same treatment for the Polish minority in Czecho-Slovakia as that accorded the Sudeten Germans. Upon publication of the Anglo-French plan of September 18 for settlement of the Sudeten question, Poland announced that if Czecho-Slovakia accepted the plan, Poland would demand part of Teschen.

Polish troops were then concentrated on the Czecho-Slovak frontier, which was closed by the Prague Government. There were anti-Czech demonstrations and sporadic clashes between Polish and Czech troops and civilians. Immediately after the Munich accord became known Poland presented an ultimatum to Prague, demanding evacuation of Teschen and adjacent areas by noon of October 1 and the surrender by October 10 of the districts of Bohumin, Frystat, and Jablunkov. Under the threat of an immediate invasion, Prague capitulated on October 1 and by October 10 the Poles were in possession of all the territory they had demanded (see the map). The district included rich hard coal mines and coking ovens and the strategically important railway center of Bohumin.

The new Polish-Czech frontier was regulated by an exchange of notes on November 1. The notes gave Poland two additional districts along the northern frontier of Slovakia, in return for which Poland declared she had no further territorial claims to make on Czecho-Slovakia. The Polish occupation of the latter districts late in November was marked by further fighting between Polish and Czech troops. During November and December there were frequent reports of serious disorders in the districts newly occupied by Poland. The Czechs alleged that 30,000 of their nationals were expelled from the districts by Poland and that those remaining were subjected to a reign of terror. The Poles, on the other hand, declared that Ukrainian and Czech organizations were terrorizing Poles in the districts and disseminating anti-Polish propaganda among the minorities in Poland proper.

Annexations by Hungary. The emasculation of Czecho-Slovakia by Germany and Poland offered Hungary an opportunity to recover part of the territories lost in the World War. Slovakia and Ruthenia had been under Hungarian rule for nearly a thousand years previous to 1918 and about 750,000 Magyar-speaking people lived along their southern borders. In an effort to forestall armed action by Hungary to recover her lost territories, Czecho-Slovakia and the other Little Entente states on August 23 concluded a non-aggression agreement with the Budapest Government. They recognized Hungary's right to rearm in return for Hungarian acceptance of a reciprocal agreement to abstain from settling their mutual disputes by force.

Nevertheless, with the development of the Czech-German crisis Hungary partially mobilized and on September 22 demanded that her minority receive the same treatment as that accorded the Sudeten Germans. On September 25 Yugoslavia and Rumania warned Budapest that they would aid Czecho-Slovakia if Hungary attacked her and on September 26 the Czechs rejected Hungary's demand for territorial cessions. The Prague authorities charged the newly constituted Slovak Government with the task of reaching a settlement with Hungary and negotiations were opened October 8 at Komarom in the disputed frontier region. The Hungarian Government demanded outright cession of the districts in Slovakia and Ruthenia having Magyar majorities and a plebiscite to determine the fate of the rest of Slovakia. When a deadlock was reached Hungary broke off the negotiations, appealed to the Munich powers, and mobilized five army classes along the Slovak and Ruthenian frontiers. At the same time armed bands of Hungarian irregulars invaded Slovak and Ruthenian frontier districts and attacked local police and administrative authorities.

Italy and Poland supported Hungary's claim to all of Slovakia and Ruthenia, while Rumania and Yugoslavia protested at this projected violation of the principle of self-determination. The Czech, Slovak, and Ruthenian authorities had meanwhile appealed to Berlin. Hitler, desirous of holding his newly opened corridor through Czecho-Slovakia to the Soviet Ukraine, opposed the Hungarian demands for non-Magyar territories and his influence was decisive. On October 26 the Czecho-Slovak Government agreed to submit the Hungarian minority problem to arbitration by Italy and Germany.

The arbitral award, announced by the German and Italian Foreign Ministers at Vienna on November 2, gave Hungary about 4566 square miles of territory in southern Slovakia and Ruthenia (see

map), with a population estimated at 1,027,450. Hungary obtained Uzhorod, the Ruthenian capital, and practically all the other important cities of southern Slovakia and Ruthenia except Bratislava and Nitra. The ceded territory contained most of the fertile agricultural land of Ruthenia and some of Slovakia's best farming districts. The new frontier severed the strategic railway connecting Czecho-Slovakia with Rumania and cut Bratislava's rail connections with the rest of Slovakia. The award created a joint Czech-Hungarian commission to delimit the frontier, determine details of evacuation and occupation, and formulate measures for the protection of Magyars remaining in Czecho-Slovakia and Czechoslovaks placed under Hungarian rule. Occupation of the ceded territory was carried out by Hungarian troops between November 5 and 10.

The Minorities Problem. The partition of Czecho-Slovakia, far from calming the national and racial hatreds in Central Europe, served greatly to intensify them. Despite their sacrifices to Germany, the Czechs found themselves saddled with an aggressive German minority which had been instructed to remain in Czecho-Slovakia "as an outpost of Great Germany" instead of exercising its right under the Munich accord to opt for return to Germany.

Neither Poland nor Hungary were satisfied with their territorial gains. Despite a warning from both Germany and Italy that they must accept the Vienna award, the Hungarians worked with Polish support to obtain all of Slovakia and Ruthenia. Poland hoped in this way to block the German advance toward the Soviet Ukraine and at the same time to eliminate the anti-Polish agitation centering in Ruthenia. The Slovaks and Ruthenians, on the other hand, resented the loss of substantial blocs of their own nationals to Poland and Hungary. They were roused to deep indignation by Hungarian and Polish efforts to denationalize the Slovaks and Ruthenians in the ceded territories by forbidding the use of their language, closing their schools, and expelling many of them from their ancestral homes. Hungarian irregulars continued their forays into Czecho-Slovak territories. Between the Vienna Award and the year end there were 19 or more armed clashes between Hungarian and Czecho-Slovak forces along the new frontiers. Late in December Hungarian gendarmes fired on Slovaks in the ceded village of Surany, killing one and wounding others. Many Slovaks were rounded up and beaten by the gendarmes. Numerous incidents of this character prompted an agitation among the Slovaks and Ruthenians for the recovery of the ceded districts. This agitation appeared to have Berlin's support.

Political Reorganization. The partition of Czecho-Slovakia was followed by complete revision of the governmental system. The trend toward dictatorship commenced with the appointment of the Syrový Cabinet, containing two generals, on September 23. On October 5 President Beneš resigned under pressure from Berlin, which had threatened to partition Slovakia between Poland and Hungary if he remained in office. The man who, with former President Masaryk, had founded and guided the state through two decades, left his country secretly for England late in October, to escape possible arrest.

On October 4 the Syrový Cabinet was reorganized on a basis more acceptable to Berlin, the main change being the appointment of Dr. Frantisek Chvalkovský as Minister of Foreign Affairs. Two

days later it announced an agreement with Slovak leaders for the extension of autonomy to Slovakia. With the departure of Dr. Beneš, the swing away from democracy and toward fascism gained momentum under constant Nazi pressure. All Masonic lodges in the country disbanded on October 13 to forestall dissolution by the government. Persons of democratic sympathies were weeded out of the government and diplomatic service. The press censorship instituted during the September crisis was made permanent. The reactionary elements now in control began to denounce Dr. Beneš and even the revered Masaryk, father of the republic, whose busts and pictures were removed from public buildings. The independent anti-Nazi German-language press was liquidated. Anti-Semitism developed rapidly, particularly in Slovakia. There was a complete reshuffling of political parties. The now dominant nationalist and pro-Fascist elements merged most of the former conservative and Center groups into a new government Party of National Unity, while many adherents of former radical and liberal movements united in an opposition group called the National Labor Party.

Revision of Constitution. The administrative reorganization of the republic was undertaken by Parliament, which met for the first time since before the September crisis on November 17. The state was changed from a unitary to a Federal republic, with a President having greatly enlarged powers. The Czech, Slovak, and Ruthenian provinces became "autonomous components" of the republic, each having a separate Diet elected by universal suffrage of all persons over 21 and a separate Premier named by the President of the republic. The three Diets were to elect representatives to a National Assembly, which elected the Federal President. The latter could be elected only with the approval of three-fifths of the Slovak representatives in the National Assembly. The National Assembly retained control of legislation covering the Constitution, foreign affairs, citizenship, emigration, transport, postal affairs, national debts, state loans and taxation, and general economic and financial matters. The Federal Government was responsible not only to the National Assembly but to the Slovak Diet. The provincial governments were placed in charge of all local affairs, including their own police and military forces.

New Officials Chosen. Parliament was convoked as the National Assembly on November 30 and elected as the new President Dr. Emil Hacha, President of the Supreme Court. A joint committee of Czechs and Slovaks had agreed upon Dr. Hacha on November 22 and his election was a matter of form. He received 272 votes of the 312 members. The German Nazi deputies, the representatives of the Hungarian minority, and some of the former Cabinet officials voted for Hacha but stayed away from the session while the 39 Communists abstained from voting. Immediately after his election, President Hacha entrusted the formation of a new Federal Government to Rudolf Beran, a strong personal enemy of former President Beneš who had been named chairman of the Party of National Unity. His cabinet, formed December 1, included Karl Sidor, leader of the Slovak Fascist Hlinka Guard as Deputy Premier, Dr. Chvalkovsky as Foreign Minister, Joseph Kalfus as Minister of Finance, and General Syrový as Minister of Defense.

Premier Beran committed his government to the gradual establishment of a completely totalitarian regime closely co-operating with Berlin in a speech

before the National Assembly on December 13. At the same time the emergency measures proclaimed during the September crisis were extended for three months. On December 14 the Chamber of Deputies by a vote of 148 to 16 conferred authoritarian powers on the Cabinet and President. The bill empowered the government to change the Constitution at will by unanimous resolution to the President and to rule by decree for two years. The Slovak and Ruthenian Governments were given similar powers in revising their provincial Constitutions. At Slovak insistence, however, the Federal Government was denied the right to change Slovakia's autonomous constitution. Federal constitutional decrees affecting the entire republic required the approval of a majority of the Slovak Government and the signatures of Slovak and Ruthenian cabinet members.

At the insistence of Berlin and in line with Premier Beran's policy, Jewish professors and teachers were suspended from all German universities and high-schools on December 22. Further anti-Semitic measures were pending. On December 24 the Cabinet forbade the formation of new political parties without government approval. Dissolution of the Communist party was decreed on December 28. Cancellation of the Communist mandates and of those representing severed territories reduced the number of seats in the Chamber of Deputies from 312 to 200 and of Senators from 150 to 99. Despite all these pro-Fascist measures, the Nazi faction of the National Unity party declared that the progress toward a completely Fascist and anti-Jewish policy was too slow and threatened violent action against the Prague Government.

Situation in Slovakia. The paralyzing of Czech authority by Germany enabled the ultra-conservative Slovak People's Party to obtain the autonomy for which it had struggled under the leadership of Father Andrej Hlinka for two decades. Hlinka (q.v.) died on August 16 and his place as chairman of the party was taken by Dr. Jozef Tiso. On October 6 an agreement was reached with Czech authorities for the appointment of Dr. Tiso as Minister for Slovakia in the Prague Cabinet and Premier of the autonomous Slovak government. The new Slovak government was formed on October 9 and the Slovak People's party and its military adjunct, the Hlinka Guard, immediately inaugurated a pro-Fascist, totalitarian drive. In the Czech provinces of Bohemia and Moravia fascism was partly the result of German pressure. In Slovakia it was adopted voluntarily by the Slovak People's party, which had previously controlled only about 32 per cent of the votes in the province and adopted authoritarianism partly as a means of consolidating its position.

The Communist party was suppressed in Slovakia on October 9. On November 8 the Slovak People's party absorbed all the other Slovak conservative groups. While the Tiso Government showed a disposition to collaborate with the Czechs, strong elements within the party and the Hlinka Guard demanded complete independence and displayed hostility toward Prague. They worked in close collaboration with Berlin and with the German Nazis in Slovakia. Toward the end of November the government dissolved the opposition National Labor Party, formed by the Slovak Social Democrats, and announced that Slovakia would henceforth be a one-party state. In the elections of December 18 to the Slovak Diet, only government candidates were permitted to stand for office. Concentration camps were established for opposition elements,

freedom of the press and the right of assembly were abolished, and the judiciary was made a tool of the government.

Carpatho-Ukraine. The new autonomous regime in Ruthenia, or Carpatho-Ukraine as it was officially known, fell even more completely under German domination. The Prague correspondent of the *New York Times* reported on December 3 that "Carpatho-Ukraine is now overrun with German agents, working energetically with Ukrainian emigrants from Poland now living there and arriving in ever-increasing numbers from Berlin, where a Ukrainian bureau has long been maintained. . . . The German schemes are based on making Carpatho-Ukraine 'the Piedmont of the Ukraine,' stirring up Ukrainian nationalism to a point where, with German assistance, the Ukrainians in Poland and Russia may be induced to revolt, and form either a German vassal state of between 40,000,000 and 50,000,000 inhabitants or a province in the German world imperium now dreamt of in Berlin."

The first Premier of Carpatho-Ukraine, Andrew Brody, was removed and arrested by the Prague Government on October 27 on charges of accepting money from Hungary to permit a plebiscite designed to restore Ruthenia to Hungary. This plan was in line with the Polish-Hungarian scheme for a common Hungarian-Polish frontier interposing a barrier to Germany's eastward expansion. Brody was succeeded by Father Augustin Volosin, who played a prominent part in the organization of a Ruthenian Fascist movement, SIC, dedicated to the greater Ukraine program. Elections for the Carpatho-Ukrainian Diet were to be held early in 1939.

DAIRYING. The decline in milk cow numbers, which began in 1934 as a result of drought and unfavorable economic conditions, was checked in 1938. The number of heifers on hand, and the heifer calves being raised, were more than sufficient for normal replacements in 1939 and 1940. Feed supplies were generally abundant and the increase in milk cows may tend to reduce cattle prices, which were relatively high as compared with other agricultural products.

Milk production during 1938 was large, and even on a per capita basis, was the highest in the 14 years of record. Milk production was estimated at 4 to 5 per cent above the 103 billion lb. produced in 1937, and was expected to continue heavy into 1939.

Feed-grain production was heavy in 1938 and there was a large carry-over from the 1937 crop. Although protein by-product feeds, especially cottonseed cake and meal, were reduced, feed supplies per animal unit were larger than in any of the 10 years prior to 1934.

Butterfat prices were unusually low in relation to the prices of meat animals, but were 30 per cent higher in relation to feed-grain prices than in the period 1910-14.

The production of the principal manufactured dairy products was about 10 per cent larger in 1938 than a year earlier, even though the 1937 production was 2 per cent larger than the 1924-29 average. The largest increases in the production of the manufactured products were 12 per cent in cheese and 11 per cent in evaporated milk. The per capita

production of these products reached new high records.

The unfortunate part of the situation was that consumer demand did not keep pace with the increased production, and prices declined sharply during the first half of 1938 with the increasing seriousness of the depression. Too heavy surpluses were avoided by purchases of 140,000,000 lb. of butter by the Federal Surplus Commodities Corporation and the Dairy Products Marketing Association, Inc. As a result, butter prices were maintained. This butter was held for resale if prices should rise or for relief distribution. In December butter prices were above the level at which the Government purchases were made.

Butter consumption continued at about the same levels as in 1937 when 16.7 lb. were consumed per capita. The steady increase in the consumption of cheese, which amounted to 5.32 lb. per capita in 1937, and evaporated milk continued.

The heavy production resulted in unusually large storage stocks of dairy products toward the close of the year. In the fall months of 1938, approximately 200,000,000 lb. of butter in storage, about half of which was held by the Dairy Products Marketing Association, Inc., was nearly double the cold storage holdings at the corresponding periods of 1937. Cheese storage of 140,000,000 lb. on October 1 was about 20 per cent greater than in 1937 and the largest on record. Evaporated milk in manufacturers' hands of about 400,000,000 lb. was nearly twice as great as in 1937. Any improvement in business conditions and a rise in consumer incomes may be expected to be directly reflected in an improvement in the dairy situation.

International Conditions. The increased production and rising storage stocks of dairy products during the last half of the year resulted in exports of dairy products that were generally heavier than in 1937. During the five months' period, July to November, there were 1,160,000 lb. of butter exported, as compared with about 700,000 lb. during the entire year of 1937. There were larger amounts of cheese exported in 1938 than in 1937, but not so much greater proportionately as compared with butter exports.

Imports of dairy products were at low levels except for cheese. Cheese imports, consisting mostly of foreign makes, especially Swiss and Italian types, continued rather uniformly at approximately 60,000 lb. during the year. Imports of casein dropped to low levels. During much of the year, London prices of Danish and New Zealand butter were higher than 92-score butter in New York.

Exports of dried and evaporated milk increased materially over 1937. Dried-milk exports in 1938 were about 3 times as heavy as in 1937. Evaporated-milk exports also increased. Imports of butter into Great Britain and Germany were heavy. During the first 6 months of the year, 552,832,000 lb. of butter were imported into Great Britain, an increase of about 2 per cent over the corresponding period of 1937. Imports into Germany of 94,427,000 lb. were 23 per cent heavier than during the first half of 1937. The combined butter imports of these two countries were nearly 30,000,000 lb. greater during the first half of 1938 than in the preceding year.

Curtailed feed production in New Zealand reduced the production of dairy products. Butter graded in New Zealand during the year ended July 31 totaled 310,257,000 lb., as compared with 335,445,000 lb. in the preceding season. However, in Australia, the amount of butter graded was 213,-

499,000 lb., as compared with 182,309,000 lb. in the season of 1936-37.

Estimates for production in Canada indicated a decrease of 12 per cent in cheese and an increase of 9 per cent in butter production for the first 8 months of 1938, as compared with 1937. Butter stocks in storage in Canada on September 1 were 61,462,000 lb., as compared with 49,525,000 lb. on the corresponding date of the preceding year.

Research. Feeding roughages attracts the interest of the dairy farmer because of its economy, in addition to the special nutritive properties found in good pasture and good quality hay and silage.

In a study of the possibilities of feeding dairy cows on alfalfa hay alone, 15 Holstein-Friesian cows were fed through 26 complete lactation periods, at four of the field experiment stations of the U.S. Bureau of Dairy Industry, on good quality alfalfa hay with salt and bone meal as the only supplements. It was estimated that the milk and fat production of these cows was about 60 per cent of the production expected on a liberal grain ration. The nutrients in the alfalfa hay were efficiently utilized and the alfalfa apparently furnished ample amounts of calcium and phosphorus, as but little bone meal was consumed and there were no symptoms of lack of appetite or depraved appetite. There were no detrimental effects on fertility, breeding, or calving condition of the cows as a result of continuous feeding of alfalfa as a sole ration over two or three lactation periods.

Studies at the U.S. Bureau of Dairy Industry and the New Jersey and Vermont Agricultural Experiment Stations found that grasses and legumes made excellent silage and could be very satisfactorily preserved if firmly packed. This was facilitated by chopping and maintaining a moisture content over 50 per cent. A survey of practices on nearly 400 dairy farms showed that grass silage proved an excellent feed, especially when molasses was added to stimulate the best type of fermentation process during storage.

An essential nutritive factor found in green plants and largely preserved in well-cured green hay is vitamin A. Studies at the Kansas Agricultural Experiment Station were concerned with the relative amounts of the vitamin A in the feed that could be recovered in the butter. Under conditions in which large amounts of vitamin A were consumed, only 24 per cent was found in the butterfat, the portion of the milk containing most of this factor. It seems more economical to supply additional vitamin A to humans by other methods than by feeding cows high vitamin A rations. The Ohio State University found that the vitamin A value of winter butter was made nearly equivalent to that of summer butter by the addition of a small amount of butter color (carotene in oil).

Numerous problems, many of a fundamental physiological nature, were undertaken and solved at the Agricultural Experiment Stations. For example, the Wisconsin Agricultural Experiment Station found that calves could gain weight on forms of nitrogen heretofore supposed to be not digestible and assimilable by animals. Supplements of ammonium carbonate and urea fed with other feeds produced increased gains over those from the other feeds alone. It was thought that bacteria, acting in some part of the calf's multiple stomach may have transformed the simple nitrogenous compounds into more complex substances assimilable by the animal. These results offer leads toward the partial replacement of some of the higher-priced proteins in the dairy ration by more simple and cheaper ni-

trogenous compounds and, therefore, may have practical economic significance.

The results of an experiment in feeding raw and pasteurized milk to calves at the Hannah Dairy Research Institute, England, showed that calves grew as well on the pasteurized as on raw milk during the 12-week feeding period. Further, 70 per cent of the raw samples were found to carry viable tubercle bacilli, and 38 per cent contained abortion organisms which cause undulant fever in man. The pasteurized samples did not carry these pathogens. Two-thirds of the calves on raw milk and none on pasteurized milk contracted tuberculosis. Thus, although pasteurization of the milk did not modify its nutritive value, the process protected against contracting diseases transmitted in the milk.

A condition in cattle known locally as "neck ail" was diagnosed by the Massachusetts Agricultural Experiment Station as a type of nutritional anemia. The soils, and plants grown in the area where this condition occurred, were found to be very low in iron. Spectacular recovery followed the administration of iron compounds to affected animals. The feeding of roughage grown on other soils where there were adequate amounts of iron prevented the appearance of the anemia.

Investigations of the physiology of lactation and factors influencing the amount and character of the secretion were conducted at a number of institutions in several countries, including among others the Missouri Agricultural Experiment Station, and institutions in Germany, Poland, and in Russia. Two hormones produced by the pituitary gland, as well as a hormone produced by the ovary, are necessary to properly condition the mammary gland and bring about the secretion of milk of normal amounts and quality. Injections of an extract of the pituitary gland into milking cows resulted in marked increases of as much as seven liters per day in the amount of milk produced, without changing the composition of the product, except for a small increase in the butterfat content. The rapidity and frequency of milking were found to be important factors in milk production.

Milk from certain cows has a greater tendency to produce so-called oxidized flavors than milk from other cows. It was found by the Pennsylvania Agricultural Experiment Station that green feeds, such as pasture, clover, and alfalfa, tended to inhibit the development of such objectionable flavors. The addition of vitamin C, hydroquinone, and oat flour, although illegal as a commercial practice, prevented the development of the oxidized flavors in the milk. The Massachusetts Agricultural Experiment Station also found that the addition of small amounts of oat flour, .25, 0.5, and 0.75 per cent, to ice cream mixes exerted a stabilizing effect and delayed the development of off-flavors during storage.

A method of freeing cream, separated from onion-flavored milk, of the onion flavor was developed at the Central Swedish Experiment Station by passing the cream through a vacuum at 85° to 90° C, after which it was aerated over a surface cooler. It was necessary to repeat the treatment (generally three times) until onion flavor could no longer be detected. Fresh butter from such cream was free of onion flavor but after being stored for two to three weeks it developed a low degree of onion flavor.

One of the most important phases of Cheddar cheese production is the ripening process. The Pennsylvania Agricultural Experiment Station made a study of the development of desirable fla-

vor in cheese made from several lots of milk. It was found from this study that the rapidity of ripening was closely related to the numbers of bacteria initially present in the cheese and the ripening temperature. Acidity and the ferments present also played an important role in the flavor of the ripened cheese.

Changes in Personnel. Prof. L. W. Ingham, in charge of dairy cattle teaching and research in the Animal Husbandry Department at the University of Maryland, resigned on July 1 to accept a similar position with the National Farm School at Doylestown, Pennsylvania. He was succeeded by Dr. K. L. Turk from Cornell University. Prof. M. Mortensen, head of the Dairy Industry Department at Iowa State College since 1909, retired on September 15. He was succeeded by Prof. C. A. Iverson of the same institution. Dr. Edwin E. Heizer of the Ohio State University, and associated with the genetic work of the American Guernsey Cattle Club and the Holstein Friesian Association of America, was appointed head of the new Department of Dairy Industry of the University of Wisconsin. Drs. M. H. Friedman and E. T. Gomez respectively were appointed senior physiologist and assistant physiologist in the U.S. Bureau of Dairy Industry to conduct research on the physiology of lactation. Dr. J. A. Nelson was appointed head of the newly formed Dairy department at Montana State College.

Necrology. Dr. H. E. Van Norman, associated with various phases of the dairy industry for about 40 years and President of the World's Dairy Congress in 1924, died on July 28, 1938. Malcolm H. Gardner, Superintendent of the Advanced Registry of the Holstein Friesian Association of America for more than 20 years, died on June 30, 1938. Prof. T. L. Haecker, a pioneer organizer of co-operative creameries and cheese factories, well known investigator in animal nutrition problems, and former head of the Dairy Department of the University of Minnesota, died on Aug. 12, 1938, at the age of 92.

DAMS. As in the case of bridges, the notable dams for several years past have been government constructions. The forces of the U.S. Bureau of Reclamation and the Corps of Engineers of the Army, augmented by a large number of engineers drawn from civil life, have been busy building structures which, year by year, have added new records in size or height for various types of dams. Much of this work has, of course, constituted a valuable and permanent addition to the economic development of the nation. Much also, unfortunately, must be classed as more in the nature of relief employment than of economic construction. See ELECTRICAL MACHINERY.

Dedications. With the closure of the two 29-ft. diversion tunnels on July 1, the Parker Dam, which, located 155 miles below Boulder Dam on the Colorado River, forms the headworks of the famous Los Angeles-Colorado River Aqueduct (see AQUEDUCTS, TUNNELS), was placed in operation. It will be recalled that this structure is remarkable in that 235 of its 340 ft. of height are submerged below stream level. (See 1937 YEAR BOOK.)

One month later the Imperial Dam, below Parker on the Colorado and at the head of the All-American Canal, was completed. This dam, together with the elaborate desilting works, was dedicated on October 18.

The completion of another interesting work was marked by the dedication on June 12 of the roller-crest dam at Gallipolis on the Ohio. This, the first roller-crest dam on the Ohio, marks a step in the modernization of the canalization works on this river—a project on which U.S. Army Engineers have been engaged for many years and which was dedicated by President Hoover in 1929. The roller gates on the new dam, 125 ft. long, are of record size.

Great Dams. The foundation cementing for the Grand Coulee Dam on the Upper Columbia was completed on January 10, and the contract was awarded for the completion of the structure on the 28th. By October, the construction of a steel trestle, which will be used to carry the dam up to the full height of 553 ft., had been completed and work was ready to go forward in placing the 5¼-million yards of concrete needed to complete the dam. The contract was let at about 34½-million dollars.

Bids were opened June 1 for building Shasta Dam and power plant as part of the Central Valley project of California under the U.S. Bureau of Reclamation. This dam is to be the second largest concrete dam in the world. To contain over 5½-million cu. yd. of concrete, it will greatly exceed Boulder Dam (3¼) in volume and will be exceeded only by the 9¼-million yards of the Grand Coulee. The height record of these three giant constructions will be in the reverse ratio with Shasta (560 ft.), less than Boulder, but greater than Grand Coulee. Twelve construction firms form the syndicate to which the contract for this 36-million dollar project was awarded.

Work on the great arched-gravity Ruby Dam (see 1937 YEAR BOOK) went rapidly forward during the year and it is expected that the preliminary unit, 250 ft. high, will be completed in 1939. The ultimate height planned for this structure is 640 ft.

Around the world, in Russia, a huge dam is also under construction for the Rybinsk Power Station

on the Volga River. The scale of the construction is similar to that of the famous earlier Dneiper River development. Dam No. 2 is to be followed by four more dams which are expected to give a final total development of from 50 to 60 billion kw-hr. per year.

TVA Dams. Satisfactory progress has been made in the various dams which are building on the Tennessee River to provide flood control, a navigable depth, and, incidentally, power. The Chickamauga Dam, near Chattanooga, is in the last cofferdam stage and foundations will be completed in 1939. Congress has, however, been unable to make up its mind on the most recent proposal for a new dam in this area—Gilbertsville. Since the construction of the Wilson Dam at Muscle Shoals on the Tennessee River and the creation of the TVA, six dams have been built, or are building, and three additional structures are proposed. The Gilbertsville Dam is planned to be the first in the series which will produce a 9-ft. depth of canalization from the Ohio up the Tennessee to Knoxville. Its location is about 20 miles above the junction of the rivers and it will flood up to the Pickwick Landing Dam now practically completed. As proposed, Gilbertsville Dam will be an earth structure, with concrete spillway and locks, of about 8600 ft. total length and a maximum height of about 145 ft.

Salt River Dams. The work of the U.S. Bureau of Reclamation in the Salt River area in Arizona makes this one of the most notable great dam centers in the world. In a 40-mile reach of the river there is the Roosevelt Dam (1911), 284 ft. high, the Horse Mesa (1927), 305 ft., the Mormon Flat (1925), 229 ft., and the Stewart Mountain (1930), 212 ft. Now to this imposing list is to be added the Bartlett Dam on the Verdi River which is to be a multiple-arch dam 297 ft. high—the highest dam of its type in the world. The U.S.B.R., acting as engineers for the Salt River Valley Water Users' Association, is rebuilding the spillways on the older dams, in the light of modern model studies, to provide the full flood capacities for which they were designed. The Bartlett Dam, about 50 miles north of Phoenix, under similar auspices, will also serve in part the Salt River Indian Reservation which is to meet 20 per cent of its cost.

Among other U.S.B.R. dams, the progress on the Seminole Dam of the Caspar-Alcova project in Wyoming (noted in previous YEAR BOOKS) should be recorded. Foundations were completed and the draft tubes for the power plant set in May, the project being already over one-third completed.

Colorado-Big Thompson Project. This project of the Bureau is also notable in that it will divert water from the Upper Colorado eastward to supply irrigation on the east slopes of the Continental Divide. The project involves several dams, canals, a 13-mile tunnel, and power plants. Work was started on November 16 when the contract for the 270-ft. high earth and rock-fill Green Mountain Dam was awarded. This project is the result of a seven-State compact which allocated to the upper basin areas $7\frac{1}{2}$ million acre-ft. of water per year.

Conchas Dam. This \$16,000,000 project, located at the South Canadian River, 30 miles northwest of Tucumcari, New Mexico, involves a concrete gravity-type dam 235 ft. high as well as a long spillway, each with long flanking earth embankments and an earth dike one mile long. The founda-

tion material is described as canyon and artesian sandstone but the dam abutments are in a dangerous shale formation. In October, a slide at the north abutment required additional excavation and construction, although the U.S. Engineers in charge of this irrigation- and flood-control project had attempted to stabilize the shale by painting the exposed surface with an asphaltic mixture.

Earth Dams. The past year has not been an entirely satisfactory period in earth-dam construction. Stretching 9000 ft. across the valley of the upper Missouri, the Ft. Peck Dam was nearing completion—95 million yards of fill had been placed by the dredges—the fill was 95 per cent completed. Water storage in the reservoir had begun, when, on September 21, some 8 million yards of fill, followed by the wash of the core pool, slumped off into the reservoir, burying track, equipment, and eight men. No official decision as to the cause of failure has been announced—core drillings in the fill have been under way to determine its character, but it appears that the material available at the site is far from ideal for earth-dam construction.

It will be recalled that in September, 1937, the Marshall Creek earth dam in Wyandotte Co., Kansas, failed when the embankment was within 10 ft. of its final height. The slip in this case was due to overloading of the foundation, resulting in a plastic movement of the underlying soil which was deficient in shearing strength. A redesign and relocation 160 ft. upstream was required. Following this failure it was found that the Prairie Lee Dam, located about 25 miles from the above in Jackson Co., Missouri, was built on unsafe foundations and would have to be removed.

A fine cohesionless sand is the only local material available for a proposed flood-control dam on the Merrimack River in New England. Tests have been made to determine what can be done to compact this material.

El Azucar. This great Mexican Dam, which will bring about a quarter of a million acres under irrigation just south of the Rio Grande, is $3\frac{3}{4}$ miles long, 138 ft. high, and requires over $5\frac{1}{2}$ -million yards of fill. In contrast to the hydraulic methods employed at Ft. Peck and in building many other earth dams, this work is being carried out by the rolled-fill process, using sheep's-foot rollers to compact the material. The technique of this method and its control have been rapidly developed in recent years and its use has been rapidly extending. This dam is being built for the Comision Nacional de Irrigacion of Mexico.

Proposed Dams. The Hansen Dam, an earth structure 9000 ft. long and 110 ft. high, is planned to be added to the Los Angeles flood-control works.

A third dam, the Marshall Ford, is to be built by the U.S.B.R., for the Lower Colorado (Texas) Authority which was created in 1934 to undertake flood-control works. The remarkable Buchanan multiple-arch dam, located about 100 miles above Austin, was completed in 1937. The Marshall Ford Dam, about 20 miles above Austin, although it is to rise 150 ft. above riverbed (with provision for a later increase of 74 ft.), is referred to in the technical press as a "low" dam. Twenty-five years ago it would have been considered in the top class.

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

D'ANNUNZIO, GABRIELE. See ANNUNZIO, GABRIELE D'.

DANZIG, dän'ts'ik, FREE CITY OF. A former German Baltic port at the mouth of the Vistula

River, which, with the surrounding territory, was constituted a Free City by Article 102 of the Treaty of Versailles. Area, 754 square miles; estimated population on June 30, 1936, 405,000, including 258,000 in the city proper. The inhabitants are predominantly German-speaking, with a Polish minority of about 10,000. Births in 1936 numbered 9072; deaths, 4816; marriages, 3349. In May, 1937, there were 52,088 pupils in primary schools, 3758 in middle schools, and 5042 in high schools. The Technical University had 1250 students in 1936-37.

Trade and Shipping. Danzig formerly handled most of the trade of Poland and a large adjoining sector of north central Europe. It is now forced to share this trade with the newly developed Polish port of Gdynia. Merchandise imports into Danzig in 1937 were valued at 141,840,000 gulden (98,640,000 in 1936) and merchandise exports at 356,520,000 gulden (325,080,000 in 1936). The average exchange rate of the gulden was \$0.1115 in 1936 and \$0.1117 in 1937. The tonnage of goods imported through Danzig harbor in 1937 was 1,515,929 metric tons (972,695 in 1936) and the tonnage of goods exported was 5,684,850 metric tons (4,675,000 in 1936). Coal, grain, and sawn timber are leading overseas exports and salt herrings, coffee, cocoa, tea, and ores are the main imports. A total of 5404 vessels of 3,294,611 tons entered the port in 1936 and 5398 vessels of 3,293,097 tons cleared.

Finance and Communications. Excluding transitory receipts and expenditures, the budget estimates of the Free City balanced at 77,500,000 gulden for the fiscal year ended Mar. 31, 1937 (81,100,000 in 1935-36). The foreign consolidated debt was 41,700,000 gulden on Mar. 31, 1936. Four main railway lines connect Danzig with Germany and three main lines with Poland. Airlines radiate from the Free City to Berlin, Königsberg, and Warsaw. There are shipping services to the principal world ports.

Government. Article 102 of the Versailles Treaty placed Danzig under the protection of the League of Nations, which is represented by a High Commissioner. The same treaty placed the Free City within the Polish customs administration and authorized Poland to control its foreign relations. The harbor is administered by a board of five Danzigers and five Poles, under a neutral chairman. The territory was granted a large measure of self-government through a Diet of 72 members elected by universal secret suffrage. The Diet in turn elects the President, Vice-President, and 10 Senators for an indefinite period. The Senate, including the President and Vice-President, is the executive and administrative arm of the government. President in 1938, Arthur Greiser (National Socialist), elected Nov. 28, 1934. High Commissioner of the League of Nations, Dr. Karl Burckhardt, of Switzerland, appointed Feb. 18, 1937. Polish High Commissioner, Marian Chovacki.

History. Having succeeded during 1937 in imposing a full-fledged totalitarian regime upon the Free City of Danzig (see 1937 YEAR BOOK, p. 207), the German National Socialist Party in 1938 proceeded to stamp out the remaining opposition and to apply all Nazi laws and principles in force in Germany. Jews were subjected to growing persecution and many of them fled from the Free City. Danzig became a part of the Third Reich in all except name and the Danzig Nazis waited with ill-concealed impatience for the formal incorporation of the Free City in Germany. Yielding to Nazi pressure, 10 Social Democratic and Catholic members of the Diet applied for "guest membership" in

the Nazi parliamentary ranks late in January, 1938. On May 29 the leader of the Danzig Nazis, Albert Foerster, was able to announce that his party had absorbed the remaining opposition deputies in the Diet with the exception of two representatives of the Polish minority. Opposition deputies who refused to become Nazi "guest members" were either in prison or had disappeared.

Meanwhile friction between Poles and Germans in Danzig grew in intensity, provoking anti-German demonstrations in adjoining Polish regions. The Senate on March 22 prohibited the free circulation of Polish currency in Danzig. Poles in Danzig were subjected to increasing Nazi pressure and violence. Many were beaten on the streets and forced to salute the swastika banner. Polish newspapers were frequently confiscated by the Danzig police. The Polish Government registered a formal protest against these developments late in August, but the Danzig Government countered with a protest against anti-Danzig demonstrations in Poland. About the same time Polish sources charged that the Nazi storm troops and other military organizations in Danzig were being secretly armed from Germany and that German army officers were training young Germans in Danzig for military service, although Danzig was formally under Polish military protection. A decree issued in the middle of October required all men from 18 to 25 years of age to undergo military training for service in the police force and made men up to 50 years of age liable for periodical military training. On October 24 the Polish Commissioner protested this decree as disguised military conscription in violation of Danzig's status as a demilitarized zone. See *POLAND under History*.

The anti-Jewish reprisals initiated in the Reich on November 10 led to the expropriation of synagogues and much other Jewish property in Danzig, the arrest of many Jews, and the flight of others to the nearby Polish port of Gdynia. Herr Foerster declared that soon there would not be a Jewish shop left in Danzig.

DARROW, CLARENCE. An American lawyer, died in Chicago, Ill., Mar. 13, 1938. Born in Kinsman, Ohio, Apr. 18, 1857, he was educated in the local schools and during 1872-73 attended Allegheny College. He taught school for three years and entered the University of Michigan to study law, but left after a year to read law in an office. He was admitted to the bar in 1877. During 1887-88 he was city attorney of Ashtabula, Ohio, when he removed to Chicago. There he became special assessment attorney, assistant corporation counsel, and acting corporation counsel, and in 1892 he became associated with the Chicago and North-Western R.R., until 1894.

In that year he assisted in the defense of the Socialist leader, Eugene Debs, who was indicted for conspiracy in the American Railroad Union case. He became chief counsel for labor in the anthracite strike arbitrations at Scranton, Pa. (1902-03), and served on a labor arbitration commission appointed by Theodore Roosevelt. Previously (1896) he ran unsuccessfully for Congress, but in 1902 he was elected to the Illinois State Legislature for a two-year term. During 1907-09 he defended William ("Big Bill") Haywood and others against the charge of murdering ex-Governor Steunenberg of Idaho and won their acquittal; in 1911 he undertook the defense of the McNamara Brothers charged with the bombing of the Los Angeles Times Building. Although not acquitted they es-

caped the death penalty and were sentenced to life imprisonment.

In 1924 Darrow undertook what was his most famous criminal case, the defense of Nathan Leopold and Richard Loeb for the killing of Bobbie Franks. Again his clients escaped the death penalty although sentenced to life imprisonment. In the following year (1925) he undertook the defense of John Thomas Scopes of Dayton, Tenn., who was charged with violating a State law forbidding the teaching of evolution in schools and colleges receiving support from the State. With Darrow leading the defense and William Jennings Bryan the prosecution, the case became a *cause célèbre*. After a month or two the trial came to a close, Mr. Scopes was found guilty and fined \$100.

Other well-known cases in which Mr. Darrow was interested were: The Kidd conspiracy case in Oshkosh, Wis. (1898); the O. Sweet case in Detroit, Mich. (1927); the Massie Case in Honolulu (1932), and the Scottsboro Case (1932). He retired from the active practice of law in 1927 and devoted himself to lecturing and writing. An opponent of capital punishment, he was for many years president of the American League to Abolish Capital Punishment, and it was his proud boast that no client of his ever received the death sentence.

Besides numerous pamphlets and magazine articles he was the author of *Persian Pearls*, essays (1902); *Resist Not Evil* (1903); *Farmington*, a novel (1904); *Crime and Criminals* (1907); *Russia's Message* (1908); *How Voltaire Fooled Priest and King* (1921); *Crime, Its Cause and Treatment* (1922); *The Story of My Life* (1932), and *Infidels and Heretics*, with Wallace Rice (1933).

DARTMOUTH COLLEGE. A nonsectarian institution for the higher education of men in Hanover, N. H., founded in 1769. The 1938 autumn session had an enrollment of 2473 students. There were 259 members on the faculty. The endowment amounted to \$17,293,500, while the total income for the year was \$1,908,170. The Fisher Ames Baker Memorial Library contained 454,005 volumes. President, Ernest Martin Hopkins, LL.D.

DEFICIENCY RELIEF APPROPRIATION ACT. See UNITED STATES under *Congress*.

DE FOREST, HENRY WHEELER. An American lawyer, died at Cold Spring Harbor, L. I., N. Y., May 28, 1938. Born in New York City, Oct. 29, 1855, he was educated at Yale University (A.B., 1876) and Columbia University (LL.B., 1877). Admitted to the bar in 1877 he joined the firm of De Forest & Weeks, but in 1893, with his brother Robert Weeks De Forest, established his own firm.

Actively identifying himself with railroad interests, when the Union Pacific R.R. acquired an interest in the Southern Pacific Co., in 1901, he became a director and member of the executive committee, and in 1913, when the properties were separated, he became vice-president of the Southern Pacific with control of its fiscal affairs. Elected chairman of the executive committee and executive head of the line in 1925 and chairman of the board of directors in 1928, he retired as chairman in 1932 but continued as a director and a member of the executive committee. Also, he had a close association with the Wells Fargo Express Co. that lasted until its absorption by the railroads.

During the E. H. Harriman-Stuyvesant Fish contest for the control of the Illinois Central R.R.

Co., in 1907, he was selected as a director for both parties, and for many years served on the executive committee of the railroad. Also in that same year, with Elihu Root, he was trustee of the majority of the capital stock of the Equitable Life Assurance Society during the joint stock control fight by E. H. Harriman and Thomas Fortune Ryan, and took a leading part in the mutualization of this company. He aided in the organization of the Pacific Oil Co., and became chairman of the board, and in 1925 was active in the consolidation of this company with the Standard Oil Co. of California. In addition, he was a director and member of the executive committee of the Bank of Commerce and when it was merged with the Guaranty Trust Co., he continued in the same positions.

Outside of business, Mr. De Forest's interests were mainly centered in conservation and hospitalization. He was one of the founders of the Sage and Rockefeller bird sanctuaries on the Louisiana Gulf Coast, and for almost ten years (January, 1928–November, 1937) was president of the New York Botanical Gardens. During his tenure, the buildings of the Gardens were renovated and rebuilt, and one of the largest collections of herbarium specimens in the world was acquired. Also, during 1924–35, he was a director and a member of the executive committee of the National Parks Association. A founder of the Columbia Presbyterian Medical Center, he was a governor of the New York Hospital and a trustee of the Presbyterian Hospital.

DEGOUTTE, GEN. JEAN MARIE JOSEPH. A French army officer, died at Charney, Rhone, France, Oct. 31, 1938, where he was born, Apr. 18, 1866. Educated at the Lycée de Bourg, the Collège Rollin, and the Lycée Charlemagne, in 1887 he volunteered for service with the 30th Regiment of Artillery, and in the following year entered the military school at Saint-Cyr.

A sub-lieutenant in the 4th Zouaves in 1890, in 1895 he saw service in Madagascar, and in 1899 entered the École de Guerre for further military studies. He took part in the China Expedition of 1900, and was appointed director of the military office at Casablanca, with the title of lieutenant-colonel in 1911. At the outbreak of the World War in 1914 he was promoted to a colonelcy and appointed chief of staff of the 4th Army Corps. Placed in command of the Moroccan Division of the 21st Army Corps in 1916, he was promoted to brigadier general. In the Champagne offensive of April, 1917, this division won renown. Given command of the 6th Army, he further distinguished himself when, with General Mangin, he staged the counter-offensive of July 18, 1918, against the German Château-Thierry pocket. The crushing defeat administered by Degoutte won for him the title "Liberator of Château-Thierry."

After the Armistice he became commander of the 3d Army, and then replaced Mangin as commander of the French Rhineland Army of Occupation. Because of the failure of Germany to pay her reparations, the French Army was ordered to move farther into the Rhineland, and in 1923 he advanced into the Ruhr, taking over coal and iron mines, administering the railroads, and placing the section under virtual martial law. He himself opposed the military occupancy of the Ruhr and in 1924 was replaced in command, being transferred to the 1st Army Corps and then to the 6th Corps. General Degoutte was given special permission to remain on active service after he had passed the age limit.

Shortly before the Armistice he had been appointed major general to the King of the Belgians, and for his war work had been rewarded with the Grand Cross of the Legion of Honor, the Croix de Guerre (three citations), and was made a chevalier-commander of the Order of the Bath by Great Britain.

DELAWARE. Area and Population. Area (1930, revised to include a later gain of 64 square miles of water through a revision of the New Jersey boundary), 2434 square miles; included water, 469 square miles. Population: Apr. 1, 1930 (census), 238,380; July 1, 1937 (Federal estimate), 261,000; 1920 (census), 223,003. Wilmington had (1930) 106,597 inhabitants; Dover, the capital, 4800.

Agriculture. The accompanying table shows acreage, production, and value of the chief crops of Delaware for 1938 and 1937.

Crop	Year	Acreage	Prod. Bu.	Value
Corn	1938	143,000	4,147,000	\$2,156,000
	1937	143,000	4,147,000	2,364,000
Wheat	1938	83,000	1,660,000	1,062,000
	1937	86,000	1,376,000	1,376,000
Hay (tame)	1938	64,000	91,000 *	928,000
	1937	64,000	85,000 *	986,000
Apples	1938	1,771,000	1,151,000
	1937	2,750,000	1,805,000
Sweet potatoes ..	1938	5,000	500,000	350,000
	1937	6,000	780,000	491,000

* Tons.

Finance. Delaware's State expenditures in the year ended June 30, 1937, as reported by the U.S. Bureau of the Census, were: For maintaining and operating governmental departments, \$9,322,146 (of which \$1,375,431 was for highways and \$2,438,780 was for local education); for interest on debt, \$88,416; for capital outlay, \$2,627,107. Revenues were \$12,080,191. Of these, property taxes furnished no part; sales taxes brought \$2,531,475 (including tax on gasoline, \$1,984,067); departmental earnings, \$538,606; sale of licenses, \$1,806,778; Federal or other grants-in-aid, \$2,023,377. Funded debt outstanding on June 30, 1937, totaled \$3,181,000. Net of sinking-fund assets, the funded debt was \$3,118,115. The State did not levy in the year 1937 any general ad-valorem tax on property.

Education. Inhabitants of school age, as estimated for the academic year 1937-38, numbered 52,500. Enrollments of pupils in the public schools totaled 44,515; this comprised 26,685 in the elementary group and 17,830 in high schools. In addition, there was an enrollment of 663 in kindergartens. The year's expenditure for public-school education totaled \$4,413,751, of which \$4,147,998 was current expenditure. The 1664 teachers were paid, for the year, salaries averaging \$1538. Over 6000 persons attended classes to educate adults.

Political and Other Events. The tercentennial of the coming of the Swedish first colonists to Delaware was celebrated, June 27-30. A memorial in the form of a representation, in bronze, of the *Kalmar Nyckel*, the vessel that brought the settlers, was set up at the spot on the waterfront of Wilmington at which the party landed. This memorial, a gift of the people of Sweden to the United States, was to have been presented by the Swedish Crown Prince, Gustaf Adolf, who came for the purpose. Temporarily overcome by illness, he did not attend, and his son, Prince Bertil, made the presentation. President Roosevelt in person accepted the memorial.

Governor McMullen announced in February that he expected to recommend to the Legislature at its next session (in January, 1939) that it create a

graduated tax on incomes, a step that the State had previously avoided. Delaware was a party, with New Jersey, Pennsylvania, and New York, to an agreement, made operative in July, for controlling the pollution, by sewage and waste, of the Delaware River. A number of industrial firms migrating from Pennsylvania came to the State in 1937. Neither the office of Governor nor that of Senator was filled by election in 1938. A Republican U.S. Representative was elected, to replace a Democrat.

Officers. The chief officers of Delaware, serving in 1938, were: Governor, Richard C. McMullen (Dem.); Lieutenant-Governor, Edward W. Cooch; Secretary of State, Charles L. Terry, Jr. (succeeded December 10 by Josiah Marvel, Jr.); Attorney-General, Percy Warren Green; Treasurer, Ernest C. Blackstone; Auditor, James W. Wise; Superintendent of Public Instruction, Dr. H. V. Holloway.

Judiciary. Chancellor, William W. Harrington; Supreme Court, Chief Justice, Daniel J. Layton and Associate Judges, Richard S. Rodney, Frank L. Speakman, Charles L. Terry, Jr., and Charles S. Richards.

DELAWARE, UNIVERSITY OF. An institution of higher learning in Newark, Del., founded as an Academy in 1743 and granted a degree-conferring charter in 1833. It contains two co-ordinate colleges—one for men and one for women. The enrollment in 1938-39 was 976, of whom 601 were men and 375 were women. The enrollment in the 1938 summer session was 454. The faculty numbered 140 members. Appropriations from the State and Federal governments, plus income from other sources, amounted to approximately \$748,800 and invested endowment funds to \$605,536. The library contained approximately 79,200 volumes. President, Walter Hulihan, Ph.D., D.C.L., LL.D.

DELAWARE AQUEDUCT. See AQUE-DUCTS; TUNNELS; WATERWORKS AND WATER PURIFICATION.

DEMOCRACY. See COMMUNISM; FASCISM. **DEMOCRATIC PARTY "PURGE."** See UNITED STATES under Elections; GEORGIA; INDIANA; KENTUCKY; MARYLAND; NEW YORK.

DE MOLAY, ORDER OF. A nonsectarian secret organization for young men between the ages of 15 and 21, founded in 1919 by Frank S. Land in Kansas City, Mo., and named in honor of Jacques De Molay, the last military grand master of the Knights Templar. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, fidelity, and comradeship, and to the promotion of the public school system and good citizenship. The Order is governed by a Grand Council of Freemasons, while the Chapters are sponsored by Masonic Bodies or groups of Masons. However, it is not a junior Masonic fraternity, and more than 60 per cent of its members are from non-Masonic families. In November, 1937, the active membership numbered approximately 150,000. The organization has an alumni of more than 860,000 men. The official organ is *International De Molay Cordon* (monthly). Frank S. Land, the founder, is Secretary General; Franklin D. Roosevelt is Honorary Grand Master; Chandler C. Cohagen, Billings, Montana, Grand Master; Allan M. Wilson, Manchester, N. H., Deputy Grand Master. Dr. Stratton D. Brooks is Executive Director of the Secretary General's staff. International headquarters are at 201 East Armour Boulevard, Kansas City, Mo.

DENISON UNIVERSITY. A coeducational Christian college of liberal arts in Granville, Ohio,

founded in 1831. The enrollment for the autumn of 1938 was 871. Faculty members numbered 65. Endowment for 1937-38 was \$3,652,432, and the educational income was \$347,146. The library contained 129,000 volumes including government documents. New dormitory for women under construction. President, Avery Albert Shaw, A.M., D.D., LL.D.

DENMARK. A kingdom of northwestern Europe, comprising the peninsula of Jutland and two main islands of Zealand and Funen, with about 200 smaller adjacent islands in the Baltic, the Faroe Islands (q.v.), and Greenland (q.v.). The King of Denmark is also King of Iceland (q.v.). Capital, Copenhagen (Köbenhavn). King in 1938, Christian X, who succeeded to the throne May 14, 1912.

Area and Population. Excluding outlying possessions, Denmark has an area of 16,576 square miles. The estimated population on Dec. 31, 1937, was 3,764,000 (1935 census 3,706,349). The urban population in 1935 was 1,708,168; rural population, 1,998,181. Living births in 1937 numbered 67,444 (18.0 per 1000 of population); deaths, 40,442 (10.8 per 1000); marriages 34,130 (9.1 per 1000). Populations of the chief cities (1935 census) were: Copenhagen and suburbs, 843,168; Aarhus, 90,898; Odense, 76,116; Aalborg, 48,132; Esbjerg, 30,714; Randers, 30,254; Horsens, 29,856; Vejle, 24,354.

Religion and Education. At the 1921 census there were 3,221,843 Protestants, 22,137 Roman Catholics, 5947 Jews, 535 Greek Catholics, and 17,349 others. There is no illiteracy. The school attendance on Jan. 1, 1936, was: Primary, 490,962; secondary, 61,565; University of Copenhagen (1935-36), 5216.

Production. About 35 per cent of the working population is engaged in agriculture and 33 per cent in industry. Commerce and fishing are other important occupations. There were in 1937, 6,609,000 acres of arable land; 1,425,000 acres of meadow and pasture, and about 859,000 acres of forests. Livestock statistics for 1937: Cattle, 3,130,000; swine, 3,152,000; horses, 570,000. In 1937 there were slaughtered 882,000 cattle and calves, 8000 sheep and goats, and 4,332,000 swine. The butter production in 1937 was 403,000,000 lb.; bacon for export, 398,000,000 lb. Production of the chief crops in 1937 was: Wheat, 13,595,000 bu.; rye, 9,448,000 bu.; barley, 50,063,000 bu.; oats, 69,583,000 bu.; potatoes, 49,236,000 bu.; sugar beets, 2,222,000 metric tons; forage roots, 21,570,000 metric tons; hay, 2,130,000 metric tons. The value of industrial production in 1937 was 3,019,700,000 crowns. Industrial products include flour, pork products, milk products, beer, margarine, cigars and cheroots, cigarettes, cotton yarn, cotton fabrics, cement, bricks, paper and cardboard, oils and varnishes, and ships.

Foreign Trade. General imports in 1937 were valued at 1,702,000,000 crowns (1,486,000,000 in 1936) and exports at 1,541,000,000 crowns (1,327,000,000 in 1936). The respective figures in old gold dollars were \$221,828,000 (\$194,570,000 in 1936) and \$201,304,000 (\$173,845,000 in 1936). The principal imports in 1937 were corn, oilcake, and meal, wheat, sawed pine, wool piece goods, coal, coke, iron and steel, other metals, machinery, soybeans. The main exports were bacon, butter, fresh eggs, ships, cattle, and machinery. In 1937 the United Kingdom supplied 37.7 per cent of all imports by value; Germany, 23.9 per cent; Sweden and Norway, 8.3 per cent. The United Kingdom purchased 51.3 per cent of the general exports; Germany, 18.5 per cent; Sweden and Norway, 11.3 per cent.

General imports in 1938 were 1,640,900,000 crowns; exports, 1,550,600,000.

Finance. Closed accounts of the ordinary budget for the fiscal year ending Mar. 31, 1938, showed receipts of 544,600,000 crowns; expenditures of 521,100,000 crowns, and a surplus of 23,500,000 crowns. For 1938-39 the budget estimates placed receipts at 516,800,000 crowns, expenditures 514,200,000 crowns. For 1939-40 the budget estimates placed receipts at 517,900,000 crowns and expenditures 513,900,000 crowns. The public debt on Mar. 31, 1938, was 1,254,000,000 crowns, as compared with 1,322,000,000 on Mar. 31, 1937. The average exchange rate of the crown was \$0.2207 for 1937 and \$0.2183 for 1938.

Transportation. On Mar. 31, 1937, there were 1483 miles of state railway lines and 1662 miles of private lines. During the year ending Mar. 31, 1937, all railways carried 61,153,000 passengers, 7,600,000 metric tons of freight, and reported gross receipts of 142,850,000 crowns. The road mileage was 32,211 in 1937. On Jan. 1, 1938, there were 144,901 automobiles in the country. Statistics for the Danish civil airline in 1937 were: Passengers carried, 13,293; baggage, 219,206 lb.; mail, 264,702 lb.; and freight, 200,737 lb.; receipts, 1,512,534 crowns; working expenses, 1,686,559 crowns. The merchant marine in 1938 comprised 695 vessels of 100 tons or over with a capacity of 1,129,859 gross tons. During 1936 a total of 36,969 vessels of 13,929,000 net registered tons entered Danish ports in overseas trade. In 1937, 24,809 ships of 8,005,498 tons entered Copenhagen.

Government. The Constitution vests executive power in the King, who acts through a cabinet responsible to the Rigsdag (Parliament). Legislative power rests jointly in the King and the Rigsdag. The Rigsdag consists of two chambers, the Folketing (lower chamber) of 149 members elected for four years by proportional representation and the Landsting (upper chamber) of 76 members, of whom 19 are elected by the Landsting itself and the remainder indirectly by voters of over 35 years of age. The term of Landsting members is eight years. Premier in 1938, Th. A. M. Stauning (Social Democrat), heading a coalition government of the Social Democratic and Radical parties, reconstructed Nov. 4, 1935.

HISTORY

Internal Affairs. Despite a considerable rise in the cost of living, the persistence of unemployment on a fairly large scale, and the disturbing influences of the repeated European political crises during 1938, internal conditions in Denmark showed some improvement over 1937 and the country enjoyed a fair measure of prosperity. A threatened strike of 200,000 workers late in March was settled in April through the intervention of a government mediator, the settlement providing for wage increases averaging about 7 per cent.

The Stauning Government concentrated its main energies during the year on measures designed to strengthen the nation economically and socially and to promote the readjustment of its economic system to changing world conditions. Legislation enacted included social relief laws guaranteeing increased unemployment relief, especially to young people and laborers who had been out of work for some time; providing for the free distribution of beef, pork, and milk to the poor; granting longer vacations with pay for workers; improving the law governing apprentices, and extending the existing extraordinary tax law to provide funds for the new

social relief measures. Even before these laws were passed, the government was spending more than 30 per cent of all its expenditures on social relief.

Another law authorized the Minister of Internal Affairs to lend 100,000,000 crowns during the ensuing six years to municipalities, building societies, and private individuals for the construction of buildings and homes. The measure was designed to stimulate the lagging construction industry and revive employment. A new motion-picture law sought to raise the cultural standards and to assist the production of Danish films. Following the crisis over Austria in March, the government overcame its notorious reluctance to spend money on national defense and on April 12 secured authority to raise an internal loan of 50,000,000 crowns for the storage of raw materials, fuel, and other essential imports, for civil air-raid shelters and for improved defense equipment. The loan, which was immediately subscribed, was covered by an increase in the income tax.

At the reopening of Parliament for the autumn session on October 4, Premier Stauning announced that the two principal tasks facing it were further measures to solve the unemployment problem and revision of the Constitution to curtail the influence of the conservative upper chamber and to democratize the system of elections to that body.

The progress of the Nazi movement both among young Danes and the German minority in South Jutland caused growing apprehension in view of German intervention in Austria and Czecho-Slovakia on the basis of Nazi activities among German elements in those countries. A sitting of the Folketing on April 13 was interrupted when a Danish Nazi in the visitors' gallery fired two blanks from a pistol, thus dramatizing the increased Nazi activities that had followed Germany's annexation of Austria. The following day 800 Nazis of the German minority held a demonstration at Haderslev near the German frontier amid a counter-demonstration by loyal Danes. The Nazis demanded a commercial union with Germany, a "cultural government" of their own, the application of German inheritance laws to farms in North Schleswig, etc. Meanwhile the Danish minority on the German side of the Schleswig frontier were meeting with growing discrimination from the German authorities. They complained to Chancellor Hitler on October 15, following his demand for self-determination for German minorities abroad, that they were cut off from social benefits such as aid for large families and that their economic activities were being restricted. Nine Germans and three Danes were arrested on November 22 as members of a German espionage organization for supplying news of ship movements in Danish waters and other information in time of war.

Foreign Affairs. Denmark during 1938 continued its collaboration of former years with the other Scandinavian countries in the development of common foreign policies and trade co-operation. The Foreign Ministers of Denmark, Finland, Norway, and Sweden met at Oslo on April 5-6 and agreed upon closer political and economic collaboration with a view to maintaining their neutrality in the expected European conflict. It was decided to bring the Scandinavian neutrality pact of 1912 up to date and to discuss with the British Government the adherence of the Scandinavian powers to the London naval treaty of 1936. The revised neutrality agreement, covering issues raised by the World War such as the use of airplanes and radio, was signed at Stockholm on May 27.

The neutrality policy, implying repudiation of obligations assumed under the Covenant of the League of Nations, was further extended at a conference held in Copenhagen July 23-24 by representatives of the four Scandinavian states and The Netherlands, Belgium, and Luxembourg. At the final session the Foreign Ministers of the seven so-called "Oslo Powers" adopted a declaration to the effect that the League Covenant did not require them to apply sanctions against an aggressor. The Danish Foreign Minister declared that "all seven of our states are definitely determined never to participate in any conflict between great powers." Previously Denmark had recognized Italy's conquest of Ethiopia (May 24). At the opening of Parliament on October 5 Premier Stauning emphasized the necessity for Denmark to remain strictly impartial in a European conflict. On October 14 Foreign Minister Munch told Parliament that the Oslo Powers felt themselves relieved of the necessity of imposing sanctions under Article XVI of the League Covenant and that in the future each country would decide individually whether to observe the obligations of the article.

Denmark joined with the other Oslo Powers on May 11, 1938, in agreeing not to renew the commercial convention signed at The Hague May 28, 1937, which called for concerted action toward gradual reduction of trade barriers and the abolition of "crisis" measures in order to restore international trade and general prosperity. Even though world conditions prevented renewal of the Hague Convention, the seven governments agreed to continue the commercial co-operation instituted under the Oslo Protocol of December, 1930.

DENTAL ASSOCIATION, AMERICAN. A national association organized in 1859 and reorganized in 1913:

"To cultivate and promote the art and science of dentistry, and of its collateral branches; to conduct, direct, encourage, support, or provide for exhaustive dental and oral research; to elevate and sustain the professional character and education of dentists; to promote among them mutual improvement, social intercourse, and good will; to disseminate knowledge of dentistry and dental discoveries; to enlighten and direct public opinion in relation to oral hygiene, dental prophylaxis, and advanced scientific dental service, and in relation to the advantages and progress of enacting and enforcing proper, just, and uniform dental laws in the several States; and collectively to represent, have cognizance of, and to safeguard the common interests of the members of the dental profession; with express powers to acquire property for the purposes of the corporation by purchase, deed, gift, bequest, or otherwise, and to hold and administer the same, and to publish dental journals, reports, and treatises."

This object is accomplished by means of an annual meeting at which scientific papers are read and clinics are presented, by the publication of *The Journal of the American Dental Association*, and through the work of various bureaus and committees as follows: Bureau of Public Relations, Library Bureau, Bureau of Chemistry, Council on Dental Therapeutics, Committee on Dental Legislation, Committee on Dental Economics, and Research Commission. The membership, as of Dec. 1, 1938, was 44,000 dentists. The secretary, Dr. H. B. Pinney. Offices are at 212 East Superior St., Chicago, Ill.

DENVER, UNIVERSITY OF. A coeducational institution of higher learning in Denver, Colo.,

founded in 1864. The registration for the autumn quarter of 1938 totaled 2959, while the enrollment in the 1938 summer session was 1359. The faculty has 257 members. The assets consisted of endowment assets of \$2,559,444 and plant assets of \$1,704,634. The income for the year 1937-38 was \$797,643. The library contained 112,748 volumes. Chancellor, David Shaw Duncan, Ph.D., LL.D.

DEPAUW UNIVERSITY. A coeducational institution for higher learning in Greencastle, Ind., under the auspices of the Methodist Episcopal Church, founded in 1837. The enrollment for the autumn session of 1938 was 1394, including 793 men and 601 women. The faculty numbered 102. The productive funds amounted to \$5,904,621, while the total gross income for the year was \$483,670. The library contained 87,747 volumes. President, Clyde E. Wildman, Ph.D.

DE SCHWEINITZ, GEORGE EDMUND. See SCHWEINITZ, GEORGE EDMUND DE.

DETROIT. See MICHIGAN.

DETROIT, UNIVERSITY OF. An institution of higher education in Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers, founded in 1877. In the autumn of 1938 there were 3331 students registered. The summer school registration was 572. The faculty numbered 191. The endowment amounted to \$1,640,000, while the income in 1937-38 was \$709,652. There were 97,928 volumes in the library. President, the Rev. Albert H. Poetker, S.J., Ph.D.

DISARMAMENT. Notwithstanding the unprecedented armament race in 1938 there was an increasing feeling that there must be eventual limitations, a need recognized by such leaders as Mussolini, Chamberlain, and Roosevelt.

Political events in the last few years and the consequent armaments race were characteristic of the general distrust between nations and growing anxiety on the part of the various peoples. At the most conservative estimate, military expenditure in the principal countries increased by about 50 per cent between 1934 (when the work of the Conference on the Reduction and Limitation of Armaments came to an almost complete standstill) and 1937. Even at the time of greatest difficulties the possibilities of resuming previous efforts in this field were not overlooked.

In November, 1936, the Assembly of the League of Nations reconstituted the Third Committee for the study of questions relating to the reduction and limitation of armaments. The Committee had not sat for five years (1931 to 1935) because of the existence of the Conference on the Reduction and Limitation of Armaments. In re-appointing the Committee, the 1936 Assembly evidently wished to show that in spite of the temporary suspension of the work of the Conference, the obligations assumed by the states in respect of reduction and limitation of armaments by their signature of the Covenant of the League of Nations must not be forgotten.

As the 1936 and 1937 Assemblies emphasized, those obligations were of a permanent nature. The States Members of the League were still bound by Article 8 of the Covenant. In Article 23 of the Covenant the member states entrusted to the League

"the general supervision of the trade in arms and ammunition with the countries in which the control of this traffic is necessary in the common interest."

The work of preparation and research done by the League of Nations or under its auspices had been directed to the four objects mentioned in that text, namely: (1) Reduction and limitation proper, (2) Publicity of armaments, (3) Supervision of the manufacture of arms, (4) Supervision of the trade in arms.

On May 11, 1938, the Council of the League of Nations dealt with the question of fixing a suitable date for the meeting of the Bureau of the Conference for the Reduction and Limitation of Armaments. In his report to the Council, the representative of Iran, M. Bahramy, drew attention to the Bureau's decision of May 31, 1937, to the effect that it should meet again, at a date to be fixed by the Council, for the purpose of considering the replies from the governments, discussing the draft Convention on Publicity for National Defense Expenditure, and deciding upon appropriate measures.

He also pointed out that 28 countries had answered the circulars on the question of budgetary publicity sent to governments by the Secretary-General on June 19 and Oct. 23, 1937—Union of South Africa, United States of America, Belgium, Brazil, United Kingdom of Great Britain and Northern Ireland, Canada, Chile, Colombia, Czecho-Slovakia, Denmark, Estonia, Finland, France, Greece, Hungary, India, Japan, Mexico, Netherlands, New Zealand, Norway, Portugal, Rumania, Spain, Sweden, Switzerland, Turkey, U.S.S.R.

Some of the replies received were entirely negative. The great majority of states were fundamentally in favor of the draft Convention on Budgetary Publicity, but many of them stated that their definite acceptance of the draft was dependent on its being generally accepted by the governments or at least by the principal military and naval powers. The rapporteur also observed that various governments, including some of the principal military and naval powers, had not yet replied.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell, in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1938. In policy the churches are congregational. There are six major agencies of the communion: The United Christian Missionary Society; Board of Higher Education; Association for the Promotion of Christian Unity; Pension Fund; The National Benevolent Association; Board of Church Extension; besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are related in an advisory way to the International Convention of Disciples of Christ which meets annually in the late summer or early autumn. The general missionary work of the churches is organized under The United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind. Its board of managers of 120 is composed of an equal number of men and women. The foreign missionary work in 1938 embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay, and Tibet (Batang, on the border).

Statistics of the communion show that during the year there were 4521 baptisms in the foreign fields. The 467 mission schools had a total enrollment of 14,519. The communion maintained 10 hospitals and 16 dispensaries which gave 407,224 treatments. The Church Extension Fund amounted to \$2,861,131 with outstanding loans to 368 churches. The Pension Fund for the ministry showed assets of \$2,364,870. One hundred young people's conferences were held. Work in America was conducted among the French, Highlanders, immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The National Benevolent Association maintained six homes for children and an equal number of homes for the aged. In 1938, 26 colleges and institutions co-operated with the Board of Higher Education. The total church membership throughout the world in 1938 was 1,789,291, a gain over 1937 of 27,513; and in the United States and Canada 1,630,393, a gain of 22,677. The Bible School enrollment for the world was 1,190,366, a gain over the previous year of 21,878, and for the United States and Canada, 1,125,543, a gain of 24,303. Contributions, missionary, benevolence, and educational, reported for the fiscal year in the United States and Canada, totaled \$5,178,923, an increase of \$2,250,447. This increase included an unusual gift of \$1,800,000 to the Christian Foundation.

Among the periodicals published by the communion are *World Call*, *Christian Evangelist*, *Christian Standard*, and *Christian Unity Quarterly*. The president of the International Convention for the year was Dr. F. D. Kershner, Indianapolis, Ind.

DOMINICA. See LEEWARD ISLANDS, BRITISH.

DOMINICAN REPUBLIC. A West Indian republic occupying the eastern two-thirds of the island of Hispaniola (Haiti). The name of Santo Domingo, the capital, was changed to Ciudad Trujillo (Trujillo City) by a decree of Jan. 9, 1936.

Area and Population. The area is 19,332 square miles and the population was estimated on Dec. 31, 1936, at 1,544,549 (1,479,417 at the census of May 13, 1935). The 1935 census showed 1,406,317 Dominicans, 52,657 Haitians, 9272 British subjects (mainly British West Indians), 3221 Puerto Ricans, 1572 Spaniards, 1467 Americans, 1242 Arabs, 882 French, 716 Netherlands, 563 Cubans, 393 Italians, 312 Chinese, 129 Germans, and 694 of other nationalities. Populations of the chief cities at the 1935 census were: Ciudad Trujillo, 71,297; Santiago de los Caballeros, 33,919; San Pedro de Macoris, 18,889; Puerto Plata, 11,777; La Romana, 10,395; San Francisco de Macoris, 10,305; La Vega, 9342. About 40 per cent of the population is white (mainly of Spanish descent), 40 per cent of mixed white, Indian, or Negro blood, and 20 per cent Negro. The language is Spanish.

Religion and Education. About 97 per cent of the inhabitants are Roman Catholics. There were 20,687 Protestants and other non-Catholics in 1935. About 20 per cent of the adult inhabitants were able to read and write in 1935. The government in 1937 supported 739 primary schools, 3 normal schools, 13 vocational schools, and 15 special schools, with a total enrollment of 103,250 pupils. The enrollment in private and semi-official schools was 8270. A Chilean educational mission engaged by the Dominican Government arrived at Ciudad Trujillo

Jan. 27, 1938, to survey the educational system and make recommendations for its reorganization.

Production. Agriculture is the main occupation, supporting about 80 per cent of the population. At the 1935 census there were 209,670 farms and the area under cultivation was 946,565 hectares (hectare equals 2.47 acres). Production of cane sugar, the chief crop, was 453,803 metric tons in 1937; cacao (exports), 19,625,471 kilograms (kilo equals 2.68 lb.); coffee (exports), 11,049,142 kilos; yucca starch and tapioca (exports), 3,202,337 kilos. Coconuts, rice, bananas, potatoes, beans, onions, peanuts, pineapples, and citrus fruit are other products. At the 1935 livestock census there were 913,128 cattle, 852,973 swine, 373,204 goats, 34,824 sheep, 44,528 mules, 265,881 horses, 137,268 asses. The forests yield mahogany, espinillo, lignum-vitæ, cedar, and other cabinet and dye woods. In 1937, 245 kilos of placer gold valued at \$234,856 were exported. There were 1818 industrial establishments in 1937 with an average monthly employment of 24,576 workers and wages averaging 565,942 pesos monthly. In the same year 8628 tourists, most of them from the United States, visited the republic.

Foreign Trade. Imports in 1937 were valued at \$11,691,896 (\$9,926,567 in 1936) and exports at \$18,120,471 (\$15,149,908 in 1936). Imports in 1937 in order of value were: Cotton and cotton manufactures, \$2,246,003; machinery and apparatus, \$858,763; chemicals and pharmaceutical products, \$724,902; jute bags, \$440,269. The value of the chief exports was: Sugar and its by-products, \$11,640,877; cacao, \$2,523,729; coffee, \$1,765,055. The 1937 imports came mainly from the United States, \$6,115,157 (52 per cent); Japan, \$1,478,881 (13 per cent); Germany, \$904,767 (8); United Kingdom, \$777,073 (7). Exports went principally to the United States, \$5,832,213 (32 per cent); United Kingdom, \$5,430,447 (31 per cent); France, \$2,594,774 (14); Morocco, \$1,076,853 (6).

Finance. Government revenues in 1937 totaled \$11,561,868 (\$10,865,000 in 1936) and expenditures were \$11,390,000 (\$10,728,000 in 1936). Of the receipts, \$8,618,124 came from internal revenues and \$2,943,744 from customs receipts. On Dec. 31, 1937, there was a surplus of \$189,222 in the general funds of the Treasury. The 1938 budget estimates were: Receipts, \$11,693,770; expenditures, \$11,682,280. The monetary unit is the peso, equivalent to one U.S. dollar. Interest and amortization payments on the public debt in 1937 amounted to \$956,820. The funded debt on Dec. 31, 1937, amounted to \$15,740,000 (\$16,292,000 on Dec. 31, 1936) and there was an internal floating debt of about \$2,600,000.

Transportation, etc. There are 149 miles of public carrier railway lines and about 650 miles of private lines on sugar centrals. First-class highways extended about 929 miles in 1937 (number of automobiles, 2559). Five highways totaling 77 miles were completed during 1937 and work was begun on 352 miles of additional roads. San Pedro de Macoris is on the Pan American Airways circuit. Port works permitting large ocean liners to enter the harbor at Trujillo City were completed in 1936. In 1937 a total of 968 vessels of 1,515,616 registered tons entered the ports of the republic and 1071 vessels of 1,674,811 tons cleared.

Government. The Constitution of June 20, 1929, revised as of June 9, 1934, vests executive power in a President elected for four years by direct vote. There is a bicameral Congress consisting of 13 Senators and 35 Deputies, elected for four years by direct suffrage. Vacancies between elections are filled by each chamber from a list of three names

submitted by the head of the political party with which the retiring member was connected. However, Gen. Rafael Leonidas Trujillo Molina's Dominican party was the only political organization permitted in the republic. Trujillo assumed office as President of the republic on Aug. 16, 1930, and was re-elected May 16, 1934, unopposed, for another four-year term expiring Aug. 16, 1938. For developments in 1938, see *History*.

HISTORY

Presidential Election. The renewed foreign criticism of President Trujillo's dictatorship, provoked by the massacre of some thousands of Haitians in the Dominican Republic late in 1937, was apparently a factor leading Trujillo to announce in a radio broadcast on Jan. 8, 1938, that he would not stand for re-election. He named as his candidates for President and Vice-President, respectively, Dr. Jacinto B. Peynado and Dr. Manuel de Jesús Troncoso de la Concha. Dr. Peynado had served under Trujillo since the latter's accession to power in 1930 and at Trujillo's direction was elected Vice-President in 1934. He had displayed his devotion to the dictator by having erected on his home a huge electric sign reading, in Spanish, "God and Trujillo." Dr. Troncoso, who was rector of the University of Santo Domingo by Trujillo's appointment, was likewise an unquestioning supporter of the dictator.

In his address President Trujillo declared he was retiring from public life "only conditionally." He made it plain that he planned to continue his dictatorship in the following paragraph, concluding his speech:

I shall be a factor for order, peace, labor, and progress, thus establishing, through the edifying example of my private life—as I have already done from the highest position in public life—unequivocal proof of my complete subordination to the highest interests of the common good. Watchful sentinel of the public welfare, I shall dedicate all my efforts toward the preservation of constitutional order in the strictest sense of the word; and I shall never permit, under any circumstances, that the inestimable blessing of peace which I have given to the Dominican family, and which has always been my greatest preoccupation as a citizen and ruler, shall be unjustly altered.

The President's candidates for President, Vice-President, for Congress and the various provincial and municipal offices were duly nominated by his Dominican Party, the only political organization in the country. No other candidates dared to present themselves and only the Dominican Party nominees appeared on the ballot. As the electoral law forbade voters to write in names on the ballots, President Trujillo stated on April 15, a month before the election, that he considered his candidates already elected. With only members of the Dominican Party permitted to vote, the Trujillo Government's candidates received 318,779 ballots in the elections of May 16, according to an official announcement. This was 92 per cent of the 345,174 registered voters.

The elections were declared "legal and valid" by the Trujillo-controlled central electoral committee late in May and by the outgoing Congress on June 21. On June 23 it was announced that General Trujillo would occupy the post of Foreign Minister in the Peynado Cabinet. Drs. Peynado and Troncoso were inaugurated as President and Vice-President, respectively, on August 16. In his inaugural address, President Peynado pledged himself to safeguard Dominican interests with the help and guidance of General Trujillo.

Opposition Activities. With the question of the Presidential succession determined in accord-

ance with his wishes, President Trujillo on July 3 publicly invited the establishment of other political parties. His political opponents, most of whom were in exile, ignored the offer, fearing to return and place themselves in his power. Several thousand Dominican political exiles in New York, Puerto Rico, Mexico, and Venezuela continued their efforts to organize for Trujillo's overthrow. Dr. Angel Morales, former Dominican Minister to the United States and leader of one of the anti-Trujillo factions in the United States, spent two months in San Juan, Puerto Rico, early in 1938, enlisting the support of exiles residing there for an anti-Trujillo movement headed by himself. A Congress of Dominican Political Exiles was proposed by Dominican refugees in Mexico early in the year and was approved by anti-Trujillo groups in Venezuela and Puerto Rico.

Francisco Girona, author of a book in Spanish entitled *The Misdeeds of the Bandit Trujillo*, was convicted in a San Juan municipal court on Jan. 16, 1938, of criminally libeling the Dominican President. The suit was brought by the Puerto Rico Department of Justice. About the same time immigration officials in Puerto Rico arrested for illegal entrance a young Dominican exile, Mario Gilberto Ruso, whose harrowing tale of his imprisonments and other experiences as an opponent of President Trujillo tended to substantiate the charges of murder and ruthless terrorism made against the latter by Dominicans and foreigners.

Settlement with Haiti. The serious dispute that broke out between the Dominican Republic and Haiti over the killing on Dominican soil of some thousands of Haitians during the last three months of 1937 was peacefully adjusted by a treaty signed Jan. 31, 1938, at Washington under the auspices of the Permanent Commission established by the inter-American conciliation treaties (see 1937 YEAR BOOK, p. 214, for background of the settlement).

The commission of investigation and conciliation appointed by the Dominican and Haitian Governments in December, 1937, met in Washington commencing January 19 and soon reached a compromise settlement. It was incorporated in the Final Act of the Permanent Commission, signed Jan. 31, 1938. Under the agreement, the Dominican Republic agreed to pay Haiti \$750,000 as full compensation for injuries and damage suffered by Haitian nationals in the Dominican Republic. The Dominican Government formally expressed regrets for the killings, agreed to prosecute and punish those responsible for them under Dominican laws and to give full publicity to such punishment. It also agreed to permit Haitians who fled across the frontier to resume possession of immovable property abandoned in the Dominican Republic.

Both governments pledged themselves to control the movement of their nationals across the frontier, to repatriate nationals of each state found to be illegally in territories of the other or declared to be undesirable, and to punish those of their nationals who committed illegal acts in the other state and then took refuge in their native land. Regulations for carrying out these reciprocal obligations were to be set forth in a *modus operandi* to be concluded immediately after ratification of the agreement. The governments also agreed to conclude another pact limiting their armaments to the requirements of their security. The treaty was formally ratified by the Dominican Republic on February 10 and by Haiti on February 27. The Dominican Republic made the first payment of

\$250,000 to Haiti on February 28. See HAITI under History.

Other Events. The Dominican Government continued its efforts to secure a revision of the fiscal convention of 1924 with the United States. It was also the first Latin American government to avail itself of the new United States law permitting the Washington Government to lend technical experts to other American governments. Three United States immigration experts arrived in the Dominican Republic in August to advise the government in connection with its efforts to attract white immigrants to unoccupied lands in the western districts near the Haitian border. During the European crisis over Czecho-Slovakia the Dominican Government on September 19 notified the U.S. State Department that in case of a world conflagration it would co-operate wholeheartedly and loyally with the United States at all times. A project for an inter-American League of Nations, drafted jointly by the Dominican and Colombian Governments, was submitted to the Eighth Pan American Conference at Lima, Peru, in December. See PAN AMERICAN CONFERENCE.

DONALDSON, HENRY HERBERT. An American neurologist, died in Philadelphia, Jan. 23, 1938. Born in Yonkers, N. Y., May 12, 1857, he graduated from Yale University in 1879 and the Sheffield Scientific School in 1880. He took his medical degree at the College of Physicians and Surgeons, Columbia, in 1881. A fellow of Johns Hopkins University (Ph.D., 1885), he was appointed instructor in biology there in 1883-84 and after study abroad (1886-87), associate professor of psychology (1887-89). During 1889-92 he was assistant professor of neurology at Clark University, and subsequently professor and head of the department of neurology (1892-1906) and dean of the Ogden Graduate School of Science (1892-98) at the University of Chicago.

Invited to serve on the Scientific Advisory Board of Wistar Institute in 1905, he was selected unanimously by the Board as the man best fitted to organize research in neurology, and in 1906 he became professor of neurology and director of research at the Institute. At about this time he began his efforts to establish a uniform stock of white rats for laboratory purposes. There had been no standardized animal for comparison with human beings and Dr. Donaldson's researches resulted in the development of a strain of Albino rat. In 1915 he published *The Rat: Reference Tables and Data* (enlarged ed., 1924), which became a standard work on the subject.

He studied the endocrine glands and the thyroid, but most of his work was done in connection with the brain and the nervous system, with special reference to the growth and the changes due to age. One of the world's authorities on these subjects, in 1895 he published *The Growth of the Brain*, and in 1896 "The Physiology of the Central Nervous System," in *An American Text-Book of Physiology*.

Dr. Donaldson received honorary degrees from Clark and Yale Universities; was president of the Association of American Anatomists (1916-18), of the American Neurological Association (1937), and of the neurological section of the American Medical Association (1937), and was elected to the National Academy of Sciences in 1914. He delivered the presidential address on "The Nervous Skeleton," as head of the last-named organization. On May 12, 1932, a special anniversary number

of the *Journal of Comparative Neurology* was dedicated to him.

DRAMA. The New Year's initial contribution to the season of 1938 was a characteristically rowdy and boisterous revival of Thomas Dekker's Elizabethan comedy, *The Shoemaker's Holiday*, done in a modern adaptation of the fashion of its period by the youthful Mercury Theater organization under the direction of Orson Welles, which was received with considerably more favor than the next arrival, likewise from England but of more recent vintage. This was J. B. Priestley's *Time and the Conways*, the first of his dramatic speculations in the realm of time and the theory that past, present, and future may be coexistent. Its brief sojourn suggested that New York does not enjoy being puzzled by its drama, even when so admirable a player as Dame Sybil Thorndike heads the cast. On the same evening, for the second occasion in three days, the Mercury Theater was again sponsor, this time for a novel proletarian musical work, *The Cradle Will Rock*, by Marc Blitzstein, strikingly revolutionary to the extent that it managed to do without scenery, costuming, stage properties, or vocal talent, and quite successfully too, with the composer himself appearing also as director, announcer, and part of the cast. Again success and failure were to alternate for this was followed by another and less welcome novelty, a comedy entitled *The Greatest Show on Earth*, wherein, for a very short time, the performers enacted the roles of circus animals. Next came a novel variation of the "crook" play, *Stop-Over*, by the Messrs. Matt and Sam Taylor, finely acted by Arthur Byron, Sidney Blackmer, Muriel Kirkland, and Alice Ann Baker, which well deserved a far longer career than fell to its lot. But a much more commonplace item, *All That Glitters* by John Baragwanath and Kenneth Simpson, as staged by George Abbott, subsisted precisely three times as long.

Late January and early February added to the roster four of the year's outstanding successes in Ian Hay's amusing comedy of English boarding-school life, *Bachelor Born*, with Frederick Leister, Aubrey Mather, and Phoebe Foster pleasantly occupied therein; Paul Vincent Carroll's delicate Irish drama of spiritual values, *Shadow and Substance*, with an excellent performance by Sir Cedric Hardwicke, an exquisitely sensitive one by Julie Haydon and a capably humorous one by Sara Allgood in the more prominent roles; a most engaging fantasy of childhood, old age, and death by Paul Osborn entitled *On Borrowed Time*, adapted from a novel of Lawrence Edward Watkin, played most ingratiatingly by Dudley Digges, Dorothy Stickney, Frank Conroy, and an extraordinarily gifted and delightful child of seven, Peter Holden, who at one time or another during the long run of the piece was replaced by at least two other youngsters of similar age; and still another fantasy in Thornton Wilder's unique and fascinating cross section of everyday life over a period of years called *Our Town*, played without scenery and with but a few simple accessories, yet stirring to the imagination, especially as portrayed by Frank Craven, his son, John Craven, Martha Scott, Jay Fasset, Evelyn Varden, Thomas W. Ross, Helen Carew, and various other well-chosen actors. To *Our Town* was awarded the Pulitzer Prize of the season.

Along with these came such minor, and less durable, pieces as a dramatization of Erskine Caldwell's book, *Journeyman*, Robert Ardrey's comedy of waterfront life, *How to Get Tough About It*,

employing the talents of Myron McCormick, Katherine Locke, Kent Smith, and George Nash, and the first work in several years from the pen of Frederick Lonsdale, *Once Is Enough*, which scored over a hundred performances with Ina Claire to crystallize its cleverness. An imported English production of T. S. Eliot's poetic *Murder in the Cathedral*, though deemed superior in at least a few respects to the Federal Theater's earlier offering of the same work, proved less effective in others and not enough of a novelty to survive for more than a very short period. And but slightly happier was the lot of *Casey Jones*, a second drama by Robert Ardrey, inspired by the old song of the same name, presented by the Group Theater. Even the combination of a comedy by the usually reliable S. N. Behrman and a Theater Guild production somehow failed to score a hit, though undeniably clever and acted most entertainingly by Alexander Woolcott, Leslie Banks, Claudia Morgan, and Theodore Newton; *Wine of Choice* was its title. Oddly enough a less-deserving item, *Schoolhouse on the Lot*, in which Joseph A. Fields and Jerome Chodorov lampooned the moving picture industry from the child prodigy angle, fared better if only by a narrow margin.

Late in March this series of disappointments was interrupted by the triumphant return to the theater, after a considerable absence, of Ethel Barrymore, appearing to extraordinary advantage as the centenarian matriarch in *Whiteoaks*. Mazo de la Roche's dramatization of her own saga of the Whiteoaks family of Jalna. Further interest accrued to the occasion by virtue of the excellent support given by Stephen Haggard, Robert Shayne, Lenore Chipendale, Wyrley Birch, and Reynolds Denniston. Then came a more than commonly absorbing play by Hardie Albright, *All the Living*, a portrayal of the inner workings, rivalries, politics, and romances of a State asylum for the insane, adapted from a story by Dr. Victor R. Small, *I Knew 3000 Lunatics*. Next, after their long run in *Amphitryon 38*, dating from the fall of 1937, Alfred Lunt and Lynn Fontanne staged, under Theater Guild auspices, an engaging revival of Anton Chekhov's *The Sea Gull* in a translation by Stark Young.

April witnessed the opening of the summer season as represented by an hilarious light comedy of high-school goings-on, *What a Life*, written by Clifford Goldsmith, produced and enlivened by George Abbott, a pronounced success. Other evidences of the approach of warm weather were two attempted, but ill-starred, revivals, one *The Merry Wives of Windsor*, subsisting for four performances, the other, Ibsen's *The Wild Duck*, for three; followed by two additional revivals that fared decidedly better—Somerset Maugham's *The Circle*, with Grace George and Dennis Hoey in the roles made famous in the earlier incarnation by Mrs. Leslie Carter and John Drew, and Tallulah Bankhead, Bramwell Fletcher, and John Emory comparably happily cast; and Bernard Shaw's *Heartbreak House*, done by the Mercury Theater organization. With May there arrived an ironical comedy, *Washington Jitters*, concocted by John Boruff and Walter Hart from a novel by Dalton Trumbo, which, though offered by the Theater Guild jointly with the Actors Repertory Company and concerned with the popular sport of lampooning tendencies in the nation's capital, nevertheless ran its course in a brief three weeks. But the same month launched a couple of items better suited to the time of year, both musical, of which one promptly joined the ranks of the year's outstanding successes while the

other merely remained for the summer. These, respectively, were the Rodgers and Hart adaptation of a Hungarian fantasy by John Vaszary, *I Married an Angel*, with Dennis King, Vera Zorina, and Vivienne Segal most agreeably employed, and a moderately old-fashioned operetta, *The Two Bouquets*, by Eleanor and Herbert Farjeon, which definitely brought to a close the producing season of 1937-38.

Meantime, during these first five months of 1938, the Federal Theater Project had been continuing its experiments with the drama, in the course of which it had staged several pieces rating inclusion in a permanent record—*One-third of a Nation*, by Arthur Arent, a "Living Newspaper" survey of the housing problem; *Haiti*, a vivid work for the Negro division by William DuBois, with incidental music; E. P. Conkle's biographical portrait of the youthful Abraham Lincoln, *Prologue to Glory*, in which the central character was enacted most creditably by Stephen Courtleigh and that of Ann Rutledge by a present-day representative of the family with the same name; and Bernard Shaw's *On the Rocks*.

Activities were resumed in the metropolis in September with a revival of the old Winchell Smith-Frank Bacon triumph, *Lightnin'*, and with the veteran Fred Stone replacing the late Mr. Bacon in the so-called title role quite delightfully, though for but a brief run. Then came Elizabeth B. Ginty's diverting melodrama, *Missouri Legend*, wherein the author displayed her lingering admiration for the notorious outlaw of more romantic days, Jesse James, and capital portrayals were given by Dean Jagger, as the bandit, Russell Collins, Mildred Natwick, Dorothy Gish, José Ferrer, and others under the able direction of Guthrie McClintic. Next, a none-too-credible musical, despite its Cole Porter score, *You Never Know*, revamped from a Gertrude Lawrence vehicle of some years back entitled *Candlelight*; which, in turn, was followed by what promptly developed into one of the most popular amusements of the season—a hilarious vaudeville mélange called *Hellzapoppin*, conceived, presumably, and headed by the team of Olsen and Johnson. Harold J. Rome and Charles Friedman, who contributed in 1937 the topical revue, *Pins and Needles*, which remained current throughout 1938, attempted with but indifferent success to score a comparable hit with *Sing Out the News*. Nor did the initial offering, for the autumn, of the Theatre Guild, *Dame Nature*, find all the favor it really deserved.

Clare Boothe, on the other hand, whose vitriolic *The Women* had enjoyed a run of a year or more, seemed to be on the road toward similar success with her *Kiss the Boys Good-Bye*, an equally bitter and deliberately clever arraignment of certain types of humanity, this time of both sexes. Oddly enough, the combination of Moss Hart and George S. Kaufman failed to achieve its customary popularity for *The Fabulous Invalid*, a novel and highly elaborate production in which the Theater itself figured as protagonist—the Theater which is so often reported to be dying but somehow never dies—and whose action included brief, often nostalgic, reminders of the high spots of the American stage in the first 30 years of the present century. Another surprise was the marked favor that fell to the lot of Leslie and Sewell Stokes' tactfully frank biographical play, *Oscar Wilde*.

Genuine success attended also Maurice Evans' courageous experiment of presenting *Hamlet* in unabridged form in a performance starting at

6:30 in the evening and divided by an intermission for dinner. The gain in clarity, as well as in sustained interest, was remarkable, and, strange to relate, the action gave no impression of being unduly long nor ever grew tedious. Mr. Evans himself disclosed an altogether admirable rendering of the title part, with an uncommonly ingratiating Ophelia in Katherine Locke, an excellent King and Queen in Henry Edwards and Mady Christians, and with Whitford Kane as First Gravedigger and Augustin Duncan as the Ghost. But the reverse fortune befell the American presentation of J. B. Priestley's second dramatic venture into the new theories of time in the abstract, *I Have Been Here Before*, which fared even worse than his *Time and the Conways* of the preceding year. Meanwhile a new producing firm consisting of five of the best-known American playwrights was starting life under the happiest of auspices with a truly notable biographical drama by one of its own members, Robert E. Sherwood, staged by another, Elmer Rice. *Abe Lincoln in Illinois* was its title and, graced by a realistic and spiritually beautiful portrayal of Lincoln through his formative years by Raymond Massey, it promptly was accorded the rank of most outstanding new dramatic work of the fall. Of its expertly chosen cast, special credit goes also to Adele Longmire for her brief but charming bit as Ann Rutledge, and to Muriel Kirkland for her acting of the unsympathetic role of Mary Todd, later Mrs. Lincoln.

Knights of Song, a play with music, the idea of which was to convey an historical sketch of the long association of the Messrs. Gilbert and Sullivan, illustrated and punctuated by excerpts of varying length from their operettas, failed to arouse the enthusiasm that might have been expected from a public that flocks in droves to even second-rate presentations of the operettas themselves; and this despite a capital impersonation of Gilbert by the English comedian, Nigel Bruce, an excellent one of Sullivan by John Moore, and the incidental presence of Natalie Hall, who sang *The Moon and I* delightfully. But very shortly after the launching of the first production of the new Playwrights Company, another member, Maxwell Anderson, scored comparably with *Knickerbocker Holiday*, a musical comedy, the airs supplied by Kurt Weill, in which unaccustomed medium Walter Huston disported himself most engagingly in the role of Peter Stuyvesant. *Madame Capet*, on the other hand, an adaptation by George Middleton from the French of Marcelle Maurette, lasted scarcely long enough to be recorded here, notwithstanding a very charming portrayal of the title part, otherwise Queen Marie Antoinette, by Eva LeGallienne; and a strikingly similar fate befell another work on a related subject, a resuscitation by the Mercury Theatre of Georg Buchner's musty old *Danton's Death* in an English translation.

With November came one of those sure-fire musicals about whose popularity there is never any question provided the cast is right. And for *Leave It to Me*, fashioned by Samuel and Bella Spewack from one of their own comedies of reasonably recent vintage entitled *Clear All Wires* and equipped with a Cole Porter score, the cast was all that could be desired, comprising in its upper register William Gaxton, Victor Moore, Sophie Tucker, and Tamara. Plays by French authors, however, continued to fare ill, even though Jacques Deval was writing, in *Lorelei*, in comparatively unfamiliar English, and even despite the strongly anti-Nazi motive and the presence of Philip Merivale in the

chief role. In November, also, Shakespeare figured once more, though indirectly and merely as the source of the plot of a work for which George Abbott, Richard Rodgers, and Lorenz Hart assumed most of the responsibility and received most of the credit—*The Boys from Syracuse*, a ribald and outrageously funny musical version of *The Comedy of Errors*, with Jimmy Savo as its headliner, playing one of the twin Dromios. For its initial offering of the fall season the Group Theatre turned again to its principal dramatist-member, Clifford Odets, winning high praise for its staging of his comedy of contemporary local life, *Rocket to the Moon*. Then another musical, *Great Lady*, by Earle Crooker and Lowell Brentano, after glowing advance publicity, proved to be nothing more than an exceptionally meretricious and utterly unimportant item exploiting the amorous tendencies of the famous Madame Jumel, impersonated for the very brief duration of the piece by Norma Terris. The month closed with the third production of the Playwrights Company, Elmer Rice's *American Landscape*, a dramatic plea for the maintenance of Yankee enterprise and traditions against all assaults from beyond the seas, for which the author developed a new theatrical convention, that of introducing figures of the past as incidental characters in substantial as opposed to ghostly form.

In December Philip Barry disclosed what was eventually conceded to be his most radiant play thus far, albeit a somewhat obscure and baffling one, introspective, slightly allegorical, and concerned with spiritual values. *Here Come the Clowns* was its title, and the same theme in novel form was presently issued as *War in Heaven*. Eddie Dowling not only sponsored the presentation but also enacted its central character, with commendable support from Russell Collins, Leo Chalzel, Madge Evans, Hortense Alden, and several others. *Spring Meeting*, by M. J. Farrell and John Perry, a pleasantly diverting new English comedy in an Irish setting which had been delighting London since spring, was brought to New York with a cast headed by Gladys Cooper, A. E. Matthews, and Jean Cadell, and including, from the Irish Players, Arthur Shields, Shelah Richards, and Aideen O'Connor. The piece bore transplanting exceedingly well. Just before Christmas another new producing combination brought forth a welcome revival of Sutton Vane's beautiful, reassuring play about death, *Outward Bound*, first seen some 14 years back with a cast nearly all the members of which not already famous have since attained high distinction. The cast of the revival was scarcely less imposing, including Laurette Taylor, returning to the stage after a considerable absence, Florence Reed, Alexander Kirkland, Helen Chandler, Bramwell Fletcher, Morgan Farley, Vincent Price, Louis Hector, and Thomas Chalmers. And to the holiday gaiety Thornton Wilder, whose *Our Town* had in the spring been awarded the Pulitzer Prize, contributed a colorful prankish farce, *The Merchant of Yonkers*, which he claimed was based on an old Viennese work in turn derived from a still older English comedy, conceivably of Restoration vintage, though in its new form both clean and hilarious. Jane Cowl galloped delightfully through the leading role of this piece, with spirited support from Percy Waram, June Walker, Tom Ewell, John Call, and Nydia Westman. The year closed with an echo, if only a fleeting one, from the summer theaters, a regular professional offering of Arnold Sundgaard's *Everywhere I Roam* with finishing touches by Marc Connelly.

In Great Britain, or, more specifically, London and its environs, where the practice of offering test presentations of promising plays in the experimental theaters, followed by regular productions if their reception warrants, tends toward fewer expensive casualties, the year showed activity comparable with that recorded for New York. Its first outstanding feature was a distinguished performance of Chekhov's *Three Sisters* by John Gielgud and the permanent acting company established by him for revivals of the classics on a definitely limited run basis. Mr. Gielgud himself played Vershinin and the sisters were portrayed by Gwen Ffrangcon-Davies, Peggy Ashcroft, and Carol Goodner. *The Innocent Party*, by H. M. Harwood and Laurence Kirk, won rather more praise on the score of its brilliant dialogue than for the work of Mary Ellis in the chief role. Early in February there was public recognition of the centenary of the birth of Henry Irving. Shortly thereafter, *Othello* was staged at the Old Vic with Ralph Richardson, Laurence Olivier, and Curigwen Lewis in the principal parts, and Marie Tempest appeared in a characteristic role in *Mary Goes to See*, by Rosemary Casey and B. Iden Payne. Geoffrey Kerr disclosed another new comedy of the quiet "family" type in *Black Swans*. The dramatic version of Sinclair Lewis' *Dodsworth*, so successful in America in its native idiom, suffered in London from being done by strictly English players, even though they included Philip Merivale and Gladys Cooper.

March brought an insufficiently interesting two-character piece, *Duet by Accident*, in which Beatrix Thomson figured as author as well as half of the cast; also Thomas Browne's *Plan for a Hostess*, whose notably clever lines were spoken mainly by Yvonne Arnaud, Adrienne Allen, and Ronald Squire. Noel Coward's *Operette*, though much heralded, proved to be a half-hearted romance of the Edwardian period (circa 1906) and such popularity as it achieved was due largely to the performances of Peggy Wood, Griffith Jones, Fritz Massary, and the experienced Irene Vanbrugh. James Bridie's *The King of Nowhere* at the Old Vic presented Laurence Olivier and Marda Vanne in an interesting character study with a double motive. Robert E. Sherwood's *Idiot's Delight*, with Raymond Massey and Tamara Geva in the parts taken in the United States by Alfred Lunt and Lynn Fontanne, enjoyed marked favor and a run eventually interrupted by the autumn war scare. Distinct success fell also to the lot of *Nine Sharp*, an acutely satirical revue by Herbert Farjeon. An English adaptation of Karel Capek's *Power and Glory* disclosed a powerful study of a physician (played by Homolke) whose extraordinary and unique skill enables him to dictate to a dictator. Maxwell Anderson's debut in London as a playwright occurred when his *Masque of Kings* was produced with Eric Portman as Crown Prince Rudolph and met with pronounced approval. *The Painted Smile*, a drama of the circus, introduced a promising new writer for the stage in William P. Templeton. John Gielgud and company closed their season with an uncommonly intelligent and satisfying presentation of *The Merchant of Venice* in which Mr. Gielgud was a modestly subordinated Shylock, Miss Ashcroft a charming Portia, and Richard Ainley the Bassanio.

Late spring displayed Sir Seymour Hicks in a skilful though unconventional rendering of a character resembling, to some extent, the amazing Coster-Musica personality who was, within a few months, to astound America. The play, from the

French of Paul Armont and Leopold Marchand, was entitled *Money Talks*. At about the same time the aforementioned Alfred Lunt and Lynn Fontanne invaded, and delighted, London with the Behrman adaptation of Jean Giraudoux' *Amphitryon 38*, Richard Whorf as Mercury likewise participating in the resulting acclaim. And a serious, passionate drama on the topic of the totalitarian state, *Glorious Morning* by Norman Macowan, with Jessica Tandy figuring as a kind of modern Joan of Arc, was cordially received though destined to summary failure later when produced in New York. *Spring Meeting*, a new comedy by M. S. Farrell and John Perry with an Irish setting, though lacking any particular distinction, proved sprightly, amusing, and genuinely successful as staged by John Gielgud with Arthur Sinclair in an important butler role. *The Sun Never Sets*, a spectacular Drury Lane melodrama fashioned from the late Edgar Wallace's West African Sanders tales, while characteristically engrossing, was nevertheless regarded as wasteful of the special talents of Leslie Banks and Edna Best. The season virtually ended with Ivor Novello's entertaining study of a temperamental actress, *Comedienne*, played by Lilian Braithwaite, and another American importation, Clifford Odets' *Golden Boy*, which succeeded despite its highly localized idiom.

The annual Summer Drama Festival at Malvern exhibited five new works of note:—Bernard Shaw's *Geneva*, a satire of dictators on trial, conceded, however, to contain little that its author had not previously said in other works and usually in more pungent fashion; *Music at Night* by J. B. Priestley, an interesting venture in a new and original form of dramatic expression; C. K. Munro's *The Coronation at Mrs. Beam's*, clearly a sequel of a timely sort to his earlier *At Mrs. Beam's*; Lord Dunsany's quietly ironic *Alexander*; and James Bridie's thoughts on Judgment Day, *The Last Trump*. A creditable record for any festival.

Midsummer contributed also a moderately entertaining comedy about a resourceful orphan damsel, *Little Stranger*, by Katharine Hilliker and H. M. Caldwell, not the play of the same title done in America some years back; besides a series of open-air performances of classic dramas ranging from Aristophanes to Shakespeare with Gladys Cooper and Philip Merivale as the stars. August brought *She, Too, Was Young*, an agreeable and popular, though leisurely, study of the mother and daughter relationship in three generations of the Victorian era, by Hilda Vaughan (Mrs. Charles Morgan) and Laurier Lister, while in the very next month Charles Morgan himself made his bow as a playwright with *The Flashing Stream*, a serious drama akin to the Ibsen school, in which the chief roles were enacted by Godfrey Tearle and Margaret Rawlings. But, meanwhile, J. B. Priestley had also been making a debut—as producer, in association with Basil Dean, of R. C. Hutchinson's *Last Train South*, a melodrama in a Russian setting, engaging the talents of Flora Robson and Peter Murray Hill.

September remained active until threatening war cast its shadow over the theaters as over everything else. Its offerings included *Thou Shalt Not* —, an English version of Zola's *Thérèse Raquin*, in which Cathleen Nesbitt figured as Thérèse and Nancy Price as her Nemesis, old Mme. Raquin; Dodie Smith's placidly uneventful *Dear Octopus*, depicting the inter-reactions of a family group of four generations when assembled to celebrate the golden wedding of the senior couple, with Marie

Tempest, John Gielgud, Angela Baddeley, and Valerie Taylor setting off the author's excellent characterizations and dialogue to the best possible advantage; Emylyn Williams' honestly appealing Welsh tale, *The Corn Is Green*, in which he himself and Dame Sybil Thorndike portrayed the principal roles; Mr. Gore-Browne's *Can We Tell?*, a long, episodic account of a couple's progress through the marriage state, Jack Hawkins and Edna Best appearing as the protagonists; and *Official Secrets*, an ingenious spy play by Jeffrey Dell.

But with the war scare allayed, at least temporarily, the autumn and early winter season went on to increasing activity. With Mr. Gielgud occupied in *Dear Octopus*, a new "permanent" acting company under the direction of Michel Saint-Denis, erstwhile of the French organization known as Les Quinze, inaugurated its efforts with *The White Guard*, an anglicized version of Bulgakov's *The Days of the Turbins*, a drama of realistic character drawing but of meager action, once banned in its native Russia but later a popular item in the repertory of the Moscow Art Theatre. Peggy Ashcroft figured in the London representation as the only woman in the cast. The prolific Mr. Priestley abandoned, for a time anyway, all theorizing and pioneering and contributed a farce-comedy, *When We Are Married*, with a Yorkshire setting of the period of his own early life in that region. *Goodness, How Sad!*, by the same Robert Morley who was even at the moment being acclaimed in New York for his acting in the title role of *Oscar Wilde* as well as for his Louis XVI in the screen play, *Marie Antoinette*, proved a skilfully unhackneyed comedy of stage life as depicted by the cousins, Jill and Judith Furse and Hugh Sinclair. But London, unlike her sister metropolis across the Atlantic, failed utterly to take to her heart the fantasy on old age and death, *On Borrowed Time*. Richard Bird won credit for his acting in a psychological study of a murderer, *They Fly by Twilight*, the work of Paul Dornhorst, based on the notorious Crippen case. *Elisabeth of Austria*, a biographical drama by two sisters-in-law, Katriona and Elisabeth Sprigge, was regarded as best when its authors relied upon imagination instead of merely recounting historical occurrences. The Viennese Wanda Rotha portrayed the Empress, Gyles Isham was the Franz Josef, and Richard Ainley appeared as Elisabeth's cousin, Ludwig of Bavaria. A. A. Milne, long quiescent, disclosed a new and characteristically whimsical item, *Gentlemen Unknown*, charming in its dialogue but not over-convincing in other respects. Basil Sydney figured to fine advantage as Sir Thomas More, Chancellor of Henry VIII and famed for his *Utopia*, in Morna Stuart's *Traitor's Gate*, which dealt with the circumstances leading up to his tragic fate. James Laver contributed a clever, if disappointing, speculative drama on the personalities of Byron, Shelley, and Keats, based on the assumption that none of them actually died as and when history records. It was called *The Heart Was Not Burned*. Michel Saint-Denis' organization offered a most creditable revival of *Twelfth Night* with Miss Ashcroft a notable Viola, while a stage version of the mystifying tale of the Vanishing Lady, Hans Rothe's *Night Arrival*, as translated by Marguerite Wolff, was classed as an interesting failure. *Paradise Lost*, by America's Clifford Odets, was unable to duplicate the favor accorded his *Golden Boy*, yet another importation from the United States, Eugene O'Neill's *Marco Millions*, was greeted at the close of the year as a

welcome change from Christmas pantomime and plays designed for the rising generation.

In the French capital the outstanding new plays of the early part of the year in addition to Bernstein's *Cap des Tempêtes*, produced in 1937 and recorded in the last YEAR BOOK, were Sacha Guitry's *Quadrille* and François Mauriac's *Asmodée*, the first drama from the pen of this novelist and an exceptionally competent and subtle character study of middle-class rural society, for which a place was promptly found in the repertory of the Comédie Française. *La Sauvage*, by Jean Anouilh, scored a success though lacking something of the distinction of his last two previous works. High favor was also the lot of *Frénésie*, by a new young playwright of extraordinary promise, Charles du Perrey-Chappuis. Late spring disclosed Maurice Rostand's *Catherine Empereur*, a biographical item combining prose and verse. And as the season progressed it was marked by an apparent falling off in the quality of the output of even such well-liked writers as Denys Amiel, who contributed *Famille*, Jean Cocteau, whose *Chevaliers de la Table Ronde* was found not only confused but weak on the poetic side, and André Birabeau, who proved less amusing in his new comedy, *La Chaleur du Sein*, than he had been in his delicate *Dame Nature*. Moreover, *Les Borgias*, by the less-known André Josset, presented a disappointingly familiar picture of Lucrezia and her infamous brother. Yet another newcomer, Alfred Ghéris, fared rather well with an entertaining if not especially novel drama of apartment-house life, *Sixième Étage*.

Berlin and other drama centers of Germany early in the year celebrated the 75th anniversary of the birth of Gerhart Hauptmann by staging a series of his plays, of which the most notable offering was that of *Michael Kramer* with Werner Krauss and Bernhard Minetti appearing as father and son. With the arrival of spring the Berlin theater in particular, apparently despairing of any new native works of merit under Nazi-imposed restrictions, suddenly turned to the drama of other nations for material, and especially to England. Among the items of British origin used were Laurence Housman's *Victoria Regina* but in a version composed, for German consumption, of a different selection of episodes than the one arranged for the English-speaking countries, and in a production wherein the title role was divided between two actresses for the youthful and aged phases; also Oscar Wilde's *Lady Windermere's Fan* with Hilde Hildebrand featured in the part of Mrs. Erlynne, and Bernard Shaw's *The Apple Cart* performed in comic mood in the same house where it had been presented more seriously eight years earlier.

In Sweden, Stockholm particularly, a similar condition persisted although such native products as a refreshingly light-hearted revue, *Autumn Maneuvers*, by, and with, the popular Karl-Gerhard, scored a brilliant success, and a musical folk comedy, *The Kitchen Cavaliers*, appealed strongly to the public taste. Moreover, Selma Lagerlöf's *Dunungen* was given a presentation in honor of its author's 80th birthday. Among the foreign works done in Swedish translations were Maxwell Anderson's *Masque of Kings* (*Mayerlingdramat*) and Clare Boothe's *The Women* from America and, from the Danish, Axel Frische and Flemming Lyngé's pronounced Copenhagen triumph of the preceding season, *Herr Husassistenten*.

In the Norwegian capital *The Women* proved comparably popular though Keith Winter's *The Shining Hour*, from England, was unfavorably re-

ceived. *Axel's Seventh Heaven*, a musical piece, was well liked, and *Abraham's Offering*, a mature, tragic psychological study by the distinguished native writer and critic, Finn Halvorsen, was accepted as the most significant and artistic event of the Oslo theater in many years.

DROUGHT. See AGRICULTURE.

DUKE UNIVERSITY. An institution of higher education in Durham, N. C., which, having its origin as York Academy in 1838, was expanded in 1858 into Trinity College and in 1924, through the benefactions from James B. Duke, into Duke University. The enrollment for the autumn of 1938 was 3376. The 1938 summer school enrollment was 2739. The regular faculty numbered 386. The endowment funds amounted to over \$34,000,000. The library contained 500,000 volumes. President, William Preston Few, Ph.D., LL.D., Litt.D. See FORESTRY.

DURYEA, CHARLES E. An American inventor and manufacturer, died in Philadelphia, Sept. 28, 1938. Born in Canton, Ill., Dec. 15, 1861, he was educated in the local schools and at Gitting's Seminary at La Harpe, Ill. His mechanical ability was manifested early and at the age of 17 he built his own bicycle. Subsequently he devised several improvements for bicycles and in 1884 began to be interested in motor-carriages.

He was consultant in the building of a steam buggy in 1888 and in 1891 began the construction of his first automobile. This was successfully tested on Apr. 19, 1892, at Springfield, Mass., and is credited with being the first American automobile, although this honor was claimed also for Elwood Haynes, whose model was accepted by the Smithsonian Museum, and in 1921 the Duryea machine was placed beside it. His third car, begun in October, 1893, was the first to be fitted with pneumatic tires, and it was described by Mr. Duryea as "the world's first real automobile" because it embodied "all the essentials of the modern automobile." With it he won the first American automobile race sponsored by the *Chicago Times-Herald* and in 1896 all the prizes in a New York contest.

Duryea, with his brother Frank, who was associated with him from 1892 to 1898, organized the Duryea Motor Wagon Co., for the manufacture of automobiles. In 1900 he organized the Duryea Power Co., of Reading, Pa., to introduce an improved car. These vehicles were built from 1892 to 1914 when Mr. Duryea retired from the manufacture of automobiles to become a consulting and patent engineer and an authority on automobile history.

Mr. Duryea also was credited with having organized the country's first automobile corporation, having been the first advertiser in that field, and having taken out patents ahead of other manufacturers. Also, it was his claim that a Duryea car was a victor in the world's first track race at Providence, R. I., in 1896 and the first Eagle Rock Hill climb, Nov. 5, 1901.

Editor of the mechanical and technical department of *The Auto Trade Journal* for almost 15 years, he was also president of the American Motor League (1895-1902), for which he wrote *Roadside Troubles* and, with James E. Homan, *Self-Propelled Vehicles*.

DUST STORMS. While dust blowing was less extensive and less frequent than during several preceding years there were some sections of the country, particularly in the Dust Bowl itself and northward, where occasional storms were as severe as any reported in recent years. There were

dust storms during every month of the year though the most severe storms generally came early in the year, particularly during the early spring when winter wheat was most susceptible to damage from drifting soil.

As in previous years dust blowing was confined chiefly to the region between the Mississippi River and the Rocky Mountains but there were a few reports of dust being observed in eastern sections of the country especially during March and May.

Throughout the latter half of January noteworthy dust storms occurred, affecting chiefly Wyoming, Colorado, Kansas, and Oklahoma, causing, among other difficulties, flying schedules to be canceled, street lighting during daytime, and numerous automobile accidents due to decreased visibility. Dust storms were more extensive in March than in any other month of the year and were generally reported from the Rocky Mountain States eastward to the Ohio Valley and Tennessee and from Texas and Mississippi northward to the Canadian border. At places near the Atlantic Seaboard the presence of dust in the upper atmosphere coming from the Great Plains States was shown only by colored sunsets or sunrises and by a high dust content in rain and snow, but in portions of Mississippi, Tennessee, Kentucky, Illinois, and Wisconsin the dust was thick enough materially to limit visibility. At Dodge City, Kansas, light dust was present on 13 days, thick dust on 9 days, and dense dust with visibility $\frac{1}{4}$ mile or less on three days. On March 27-28 a rain was general throughout the State of Kansas and the average depth of rainfall exceeded an inch, yet the following day dust was observed throughout the State.

Again in May, despite the heavy, beneficial rains, dusty conditions were prevalent east of the Mississippi. Dust originating in the Great Plains States was noted as far east as South Carolina on several dates and from the 15th to 18th dusty conditions were reported from the eastern Gulf States northward to the Lake Region; visibility was as low as only 100 feet in portions of Indiana on the 16th. At this same time there were extensive dust storms west of the Mississippi.

The summer months brought a reduction in the frequency and severity of dust storms, partly due to the lower wind velocities at this season of the year. With the coming of fall there was a slight increase in the dust storms.

During the year reports of weeds and vegetation growing where dust has drifted during the past few years were encouraging. It is from loose drifts of soil having no vegetation of any kind that most dust originates. Until rainfall returns to normal, permitting a permanent vegetative cover to establish itself, dust storms may be expected from time to time throughout the Great Plains.

EARTH DAMS. See DAMS.

EARTHQUAKES. Estimates as to the actual number of earthquakes which are felt in some part of the world each year differ widely, partly because seismological observatories are not regularly distributed over the earth's surface. A. Sieberg has estimated that 9000 earthquakes take place each year and his estimate is considered reliable by

many seismologists. Fortunately, the vast majority of quakes are either feeble and harmless or else occur under the sea or in thinly populated regions. It is also difficult to determine the mean annual loss of life caused by earthquakes. Some years ago C. Davidson estimated that in an average year 14,000 persons are killed by earthquakes; later he revised this estimate and now reckons that the average number of lives lost each year in the earthquakes of the whole world is about 28,000. Heavy quakes often occur in remote regions, and are known to have happened only from the records made by seismographs over the globe; even from some populated regions, direct news is sometimes weeks or months in reaching the rest of the world. In the United States alone more than 200 earthquakes are usually reported annually.

The year 1938 was a remarkable one for earthquakes in that there was a more than average number of very severe earthquakes, but the loss of life was very small.

On January 22, at 10:05 p.m., a series of strong earthquakes shook every major island in the Hawaiian group, causing crowds to scurry from houses and theaters. Telephone service was partly disrupted in Honolulu. At the University plaster walls were cracked and the seismograph dismantled. The earthquake was the most severe to affect the Hawaiian Islands in 20 years.

On February 4, shortly after 9 p.m., an earthquake shook the whole country of Colombia. Despite the severity of this earthquake, only two lives were lost. Numerous buildings and other structures were damaged and debris thrown into the streets, and in general property damage was extensive.

On April 19, severe earthquakes accompanied by terrific underground rumbling occurred over an extensive region of central Asia Minor from the Black to the Mediterranean Sea. After-shocks lasted for 48 hours. Immediately around Kirsehir, Turkey, 10 villages were destroyed, and over the entire region at least 40 villages were destroyed. It was estimated that 50,000 persons were left homeless and 800 were dead. The relatively large number of people left homeless compared to those killed was due to the fact that the initial and severe shock took place at 2:30 p.m., local time, when most of the inhabitants were at work in the fields. The destruction of crops was also great. This region has been subject to many earthquakes in the past.

At two minutes before noon on June 11, an earthquake of unusual severity was felt all over Belgium and Holland and in the southwest of Germany, the northeast of France, and the southeast of England. It was the most severe earthquake in Western Europe in many years and the shock was accompanied by a rumbling noise. It was most severe in northern France and Belgium, where three persons were killed and 20 injured. The disturbed area was at least 380 miles long from east to west and 330 miles wide, embracing not less than 100,000 square miles. Considering the intensity of the quake and the area involved, the property damage was quite small, being estimated at about \$1,000,000. This earthquake was of less intensity than that of Apr. 6, 1580, which disturbed this same region; the epicenter of the present quake was a small distance to the east of the one of 1580.

Suddenly, and without any premonitory tremors, in the early morning of July 20, a very large area centered in northern Attica, Greece, was disturbed by a violent earthquake, which did much damage to property and caused the deaths of 20 people and injuries to a hundred others. The first pulses of this

earthquake to reach the seismological observatory at Athens did so six seconds after the initial time of the shock. The pulses immediately succeeding these were of such violence that both seismographs at the observatory were forced from their bearings and damaged. The 1000-kg. Weichert horizontal pendulum was so seriously damaged that it took several days to repair, but the 1200-kg. Weichert vertical instrument was put right almost immediately and was recording again in about one and a half hours. The very long tremors were felt by people in Athens to last 8-10 seconds, and were preceded and accompanied by quite loud deep-toned underground rumblings. The epicentral region was elongated in a northeast-southwest direction. The villages in which most damage was done were Scala Oropos, Chalcoutis, Oropos, and Sycaminon. Although Greece as a whole is liable to earthquakes, the region near and to the north of Athens has not been considered as being seismically active on a destructive scale in recent times. It was probably a seismically active region during the 7th and 8th centuries A.D., and this activity appears to have been renewed in the present instance. The damage done in the present earthquake was serious, chiefly to old and badly constructed buildings. Eight thousand people were left homeless.

A severe earthquake was experienced in the Miyagi Prefecture in the northeast of the main island of Japan (Honshu) on November 5. The focus was at some considerable depth and the shock was felt also in the Prefectures of Iwate, Fukushima, and Ibaragi, and even as far away as Tokyo, although no damage was reported in Tokyo. This earthquake was recorded on seismographs throughout the world, although no loss of life was reported.

On November 10 a very violent earthquake took place in the North Pacific Ocean. The epicenter was deep under the ocean at latitude 50° North and longitude 158° West. A seismograph located in West Bromwich, England, was reported to have had the largest amplitudes recorded in 30 years, indicating a quake of greater violence than the Quetta earthquake of 1935 or the Tokyo earthquake of 1923. This earthquake was recorded on seismographs throughout the world. The shock was felt by people in Alaska, though no damage was done there. The epicenter was 2200 miles from Honolulu. The tidal wave that reached Honolulu five hours after the shock thus traveled with a speed of 440 m.p.h. This is a record speed for tidal waves; the highest speed hitherto recorded for a tidal wave was 286 m.p.h.

It is rare to find a beneficial earthquake, but one such was reported on July 29 near the village of Réotier in the Hautes Alpes. It removed an obstruction to the water supply which experts had been trying to locate for many years. The village fountain, dry for many generations, is now gushing forth water and the acute water shortage is at an end.

EAST PRUSSIA. A province of Prussia from which it is separated by the Polish Corridor. Area, 15,061 square miles; population (June 16, 1933), 2,333,301.

ECONOMIC ASSOCIATION, AMERICAN. An organization founded at Saratoga, N. Y., in 1885, to encourage economic research, especially the historical and statistical study of the actual conditions of industrial life, to issue publications on economic subjects, and to encourage perfect freedom of thought and discussion upon current problems from an economic point of view. The mem-

bership in 1938 totaled approximately 4200. The annual meeting of the association was held in Detroit, Mich., Dec. 28-30, 1938. Among the topics discussed were: "Changing Character of Real Investment Outlets," "Expansion and Contraction in the American Economy," "Effect of Industrial and Technological Developments upon the Demand for Capital," "Role of Public Investment and Consumer Capital Formation," "Income and Capital Formation," "Attributes and Market Tactics of Large-Scale Enterprise," "Price and Production Policies of Large-Scale Enterprise," "Changing Distribution Channels," "Financial Control of Large-Scale Enterprise," "Pure Theory of Production," "Labor Policy and Wage Theory," "Lessons of the Current Decade with Respect to Recovery Policy," "Divergencies in the Development of Recovery in Various Countries," "Factors Making for Change in the Character of the Business Cycle," "Workability of Compensatory Devices," "Industrial Relations," "Wages and Hours in Relation to Innovations and Capital Formation," and "Relation of Wage Policies and Price Policies." The officers in 1938 were: President, Alvin H. Hansen, Harvard University; vice-presidents, Frederic B. Garver, University of Minnesota, and Frederick C. Mills, Columbia University; counsel, John E. Walker, Washington, D. C.; and secretary and treasurer, James Washington Bell, Northwestern University.

ECONOMICS. See BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; LITERATURE, ENGLISH AND AMERICAN; PUBLIC FINANCE.

ECUADOR. A South American republic. Capital, Quito.

Area and Population. Ecuador's boundary with Peru remains unsettled (see *History*). The area claimed by Ecuador was officially estimated at 276,007 square miles, including the Galapagos Islands (2868 sq. mi.). The government estimate of the population as of Dec. 31, 1937, was 2,807,969. Births during 1937 were reported at 110,304 and deaths at 60,291, the increase of population during the year being 50,013. The urban population on Dec. 31, 1936, was about 475,000; rural, 2,281,000. Whites comprise about 10 per cent of the total population, Indians 39 per cent, mixed races 41 per cent, and Negroes and Orientals 10 per cent. Estimated populations of the chief cities in 1937 were: Guayaquil, 139,886; Quito, 118,350; Cuenca, 45,497; Riobamba, 23,942; Ambato, 18,939.

Education and Religion. The Indian and mixed races are largely illiterate. In 1937 there were 2580 primary schools of all kinds, with 209,649 pupils; 27 secondary schools with 5936 pupils; 3552 students in special training colleges, and 1476 at the universities. Most of the inhabitants profess the Roman Catholic faith but there is no state religion.

Production. Agriculture supports about 90 per cent of the population, but mining is important, especially from the export standpoint. The quantity and value of the principal agricultural exports in 1937 was: Cacao, 48,013,000 lb. (49,985,000 sucres); coffee, 31,010,000 lb. (24,613,000 sucres); rice, 2,718,000 lb. (610,000 sucres); bananas, 1,875,000 stems (5,691,000 sucres). Other leading crops are cereals, fruits, vegetables, sugar, and cotton. The forests yield tagua nuts, rubber, balsa wood, and kapok. Livestock estimates for 1936 were 1,280,000 cattle, 700,000 sheep and goats, 150,000 swine, and 85,000 horses. Mineral production in 1937 was: Gold, 59,500 fine oz.; silver, 98,500 fine

oz.; petroleum, 2,161,000 bbl. (1,951,000 in 1936). The chief manufactures are straw hats and small quantities of cotton textiles, paper manufactures, wool textiles, sole leather, banana flakes, and flour.

Foreign Trade. Imports in 1938 were valued at 148,314,911 sucres (131,642,818 in 1937) and exports at 169,095,627 sucres (164,045,398 in 1937). The increased values in 1938 were due in large measure to depreciation of the sucre, which exchanged at an average of 10.99 to the dollar in 1937 and 13.40 to the dollar in 1938. The United States supplied 34.6 per cent of the value of all imports in 1938 (39.6 per cent in 1937); Germany, 24.1 (24.1); United Kingdom, 7.7 (10.1); Japan, 7.4 (3.2). Of the 1938 exports, the United States took 37.5 per cent (33.2 in 1937); Germany, 17.5 (21.9); France, 8.0 (12.2); United Kingdom, 4.6 (2.7); Japan, 2.4 (3.8). The value of petroleum exports in 1937 was \$2,001,000; tagua nuts, \$1,660,000; cyanide precipitates, \$1,700,000 (also see *Production*).

Finance. According to preliminary estimates, actual budget receipts in 1938 were 120,374,000 sucres and expenditures 127,315,000 sucres. The 1939 budget estimates were expected to balance at about 127,000,000 sucres. A surplus of several million sucres was reported in 1937, but no interest was paid on certain old obligations. According to the Minister of Finance the public debt on Dec. 31, 1936, was 287,772,000 sucres (external, 270,887,000; internal, 16,885,000). The cost of servicing the debt in 1939 was placed at 6,773,000 sucres (external, 5,064,000; internal, 1,709,000). The average exchange rates of the sucre in U.S. currency in 1937 were: Official, \$0.095; curb, \$0.077; free, \$0.074.

Transportation. In 1937 Ecuador had 773 miles of railway line and 2025 miles of roads (3429 automobiles). The German-controlled Seda Co. opened a tri-weekly air mail and passenger service between Quito and Guayaquil on July 11, 1938. On Nov. 19, 1938, the Pan American-Grace Airways linked Quito with the other American capitals by making it a stopping point on the Guayaquil-Cali (Colombia) route. During 1936, 465 vessels entered the chief port, Guayaquil.

Government. The military government established by the coup d'état of 1925 was ended with the adoption of a new Constitution on Mar. 26, 1929. Government under the 1929 Constitution was marked by continual friction between the executive and legislative branches, with Congress forcing the resignation of successive Presidents. When a split among members of the dominant Liberal party forecast the election of a Conservative President in the 1935 elections, the army, on Sept. 26, 1935, again intervened and established a dictatorship under Federico Páez. The Páez Government held elections for a Constituent Assembly on July 12, 1937, and this body convened on Aug. 10, 1937, to consider a new Constitution submitted to it in draft form. Friction between the Provisional President and the Constituent Assembly developed and when the Assembly, supported by the army, defied Páez in repealing the controversial Social Security Law, the Provisional President resigned on Oct. 23, 1937 (see 1937 YEAR BOOK, pp. 222-223). He was succeeded by Gen. G. Alberto Enriquez, Minister of War in the Páez Cabinet, who dissolved the Constituent Assembly as unrepresentative of the national will, restored the Constitution of 1906, and announced that he would rule "until the convocation of a genuine assembly elected with the collaboration of all parties." For developments in 1938, see *History*.

HISTORY

Political Developments. Provisional President Enriquez lost little time in carrying out his pledge to resign as soon as he had convened a Constituent Assembly elected with the collaboration of all parties. A newly elected Constituent Assembly, representing Liberals, Conservatives, and Socialists, was convened at Quito on Aug. 10, 1938. On the same day General Enriquez resigned. He was succeeded as Provisional President by Dr. Manuel Maria Borrero, a Liberal, who was elected by the Assembly. Dr. Borrero immediately announced that he would form a cabinet including representatives of all three parties.

The understanding was that Dr. Borrero's tenure of office was to last only until the Constituent Assembly promulgated a new Constitution and proceeded to the election of a Constitutional President, tentatively set for October 9. However, this program was delayed by factional struggles within the Assembly over the choice of a new President and other matters. The Assembly's first act after electing a Provisional President was to adopt a general amnesty for all political exiles and to appropriate funds for their return. On November 9 it sought to end the struggle over the Presidency by voting 28 to 24 in favor of a motion declaring both Provisional President Borrero and his chief rival, Dr. Francisco Arizaga Luque, the president of the Assembly, ineligible for election as Constitutional President.

Meanwhile, on November 8 the force of some 700 carabineers in the capital threatened to revolt against a measure voted by the Leftist majority of the Assembly dissolving the carabineers as an independent body and incorporating them with the unarmed police forces. A session of the Assembly on November 8 was interrupted by violent attacks upon radical members, attributed to disguised carabineers. The resulting storm in the Assembly led the President and cabinet to threaten to resign on November 10, but soldiers restored order in the capital and the provisional government continued in office.

A new struggle immediately developed in Congress over former Provisional President Luis Larrea Alba. The latter was a political exile in Chile when Congress voted the amnesty measure. His partisans demanded that he be permitted to return and secured the enactment of a bill restoring him to active service and promoting him from the rank of colonel to general. A group of army officers was reported on November 20 to have attempted to proclaim Larrea Alba head of the government, but the bulk of the army remained loyal to the Constituent Assembly. Conservatives in the Assembly then succeeded in revoking the bill elevating Larrea Alba to a generalship. When they emerged from the Assembly, the Conservatives were attacked in the streets by radical adherents of Larrea Alba and the army was again forced to restore order. On December 1 Provisional President Borrero resigned and on the following day the Constituent Assembly elected Dr. Aurelio Mosquera Narvaez as President in accordance with the new Constitution that had been approved at midnight. Many Conservatives abstained from voting for Dr. Mosquera Narvaez, who was president of the Liberal party.

The new President immediately found himself engaged in a struggle with Larrea Alba's supporters, who again enacted the measure restoring the latter to active service as a general. Dr. Mosquera Narvaez advised the Assembly that this action was

unconstitutional. When the Assembly declared his message disrespectful and returned it, the President on December 13 dissolved the Assembly, arrested several Socialist members and Dr. Arizaga Luque, and ordered immediate elections for new Senators and Representatives. Three battalions of the Quito garrison then rose in revolt in support of the dissolved Assembly but major hostilities were averted when Dr. Mosquera Narvaez agreed on December 15 to certain conditions for the election of a new Congress on Jan. 15, 1939. Congress was to convene February 1 and elect a new President. This concession won Dr. Mosquera Narvaez sufficient military support to terminate the disorders in Quito and restore the government's full authority.

The Enriquez Reforms. The difficulties faced by the Borrero Government were due in part to the tension between conservative and liberal-radical elements of the population provoked by the radical reforms carried out by Provisional President Enriquez during his short rule. The flood of decrees issued by Enriquez in 1937 (see 1937 YEAR BOOK, p. 223) continued during 1938 up to the time of his resignation. On January 12 he demanded the revision of all contracts and concessions held by foreign companies in Ecuador. He forced compliance with his demands by brushing aside legal and diplomatic obstacles. Mining properties of the American-owned South American Development Co. were seized by government troops and their gold production impounded when the company sought legal adjudication or arbitration of the government's demands. Representations made by the State Department at Washington on behalf of American companies were bluntly rejected. All American Cables, the British-owned Anglo-Ecuadorean Oil Co., the Ecuadorean subsidiary of the United Fruit Co., and many other foreign corporations were obliged to sign new agreements which substantially increased their payments to the government. The tariff exemptions granted many foreign concerns on imports of machinery and equipment used in their operations were cancelled. In some instances foreign companies were induced to advance their taxes for as many as 15 years.

On February 16 the government issued a decree providing that contracts for the exploitation of natural resources might be revised unilaterally by the state if they "injured national interests." Another decree of the same date required all foreigners domiciled in Ecuador to invest \$1000 in U.S. currency in Ecuadorean agriculture or industry. A decree of May 18 required all foreigners except diplomatic and consular officials to acquire residence permits at 20 sucres each. President Enriquez denied that these financial measures were taken in response to the pressing necessities of the budgetary situation (see *Finance*). Nevertheless, the result was a substantial improvement in the government's financial situation.

Other decrees reorganized the Central Bank; re-established complete control of imports; called for pre-nuptial medical certificates; required employers to teach all their employees between the ages of 8 and 21 to read and write; ordered a 10 to 15 per cent increase in wages of all private employees receiving 500 sucres a month or less; reorganized the secondary educational system; dissolved existing teachers' unions and transferred their assets to a new government-sponsored National Union of Educators; reduced the military conscription term from one year to 11 months to permit the transfer of conscripts to labor on highways and irrigation projects for one month; lent aid to the co-operative

movement; abolished a state control of tobacco cultivation and provided for construction of a national factory for the manufacture of cigars and cigarettes. Expulsion of all alien Jews except those engaged in farming was ordered January 18. A company of troops was sent to the Galapagos Islands on January 25 to supervise foreign activities on the islands.

While the dictator's vigorous measures against foreigners were widely acclaimed, his efforts to improve the lot of the laboring masses and his purge of allegedly corrupt and subversive opposition elements within the country aroused strong criticism. His arbitrary and often ill-advised economic measures antagonized other groups. An attempt to assassinate the dictator was made in January and thereafter it was only by frequent arrests and deportations of political opponents and conspirators that he managed to retain control. His proposals for reform of the Supreme Court led to the resignation of five cabinet members on April 10. He appointed another cabinet composed of army officers with one exception, but was obliged to replace this with a civilian ministry on June 6 due to growing criticism of military government. This cabinet remained in office until the resignation of General Enriquez in August.

Late in May the government ordered the arrest of ex-President Páez, four former cabinet members and two government engineers on charges of misapplying funds for railway construction. Two Swiss contractors, Edwin and Eugen Scotoni, had been imprisoned earlier in the year for allegedly misappropriating funds advanced to them by the government for railway building purposes. Páez took refuge in the Chilean Legation in Quito and a few days later escaped to Colombia.

The Dispute with Peru. Direct negotiations between Ecuadorean and Peruvian delegations in Washington for a settlement of their 117-year-old boundary dispute (see 1937 YEAR BOOK, p. 223) were interrupted in 1938. On June 1 there was another of the periodical clashes between troops in the disputed frontier zone. Both Ecuador and Peru charged one another with responsibility for the incident. Troops along the Napo River were reinforced by both sides and a brief war scare developed. There were demonstrations in Quito against Peru and subscriptions were collected for the purchase of military aircraft. In some circles in Ecuador Provisional President Enriquez was charged with deliberately provoking the war scare in order to divert attention from internal difficulties. He formally denied this charge on June 7. The United States and other neutral governments aided in calming the tempers of the two nations and on June 17 Ecuador and Peru signed an agreement for simultaneous release of prisoners and withdrawal of reinforcements from the Napo River district.

The boundary negotiations were resumed at Washington but in September an impasse developed and on September 29 the Peruvian Foreign Minister announced at Lima that Peru felt obliged to discontinue the Washington discussions. No agreement appeared possible either on the fundamental issue or on the scope of the questions to be submitted to arbitration. Both countries had previously agreed that the President of the United States was to arbitrate the question if no direct settlement was possible.

Ecuador on October 4 telegraphed all of the American governments expressing the hope that Peru would reconsider its decision to terminate the Washington negotiations. On October 12 Ecuador

invited the Presidents of Argentina, Brazil, Chile, the United States, and Uruguay to mediate the Ecuadorean-Peruvian dispute. The same governments, with Peru, had negotiated a settlement of the Chaco dispute in July. After consultation with the other governments mentioned, President Roosevelt replied on October 17 that the United States would join in attempting to mediate the dispute provided Peru was agreeable to Ecuador's proposal. Peru declined and no agreement for resumption of the negotiations was reached by the year end.

Other Foreign Relations. A reciprocal trade agreement between Ecuador and the United States was signed Aug. 6, 1938, and went into effect October 23. Both governments reduced import duties on various articles and bound themselves not to raise existing duties on other commodities. While President Roosevelt was vacationing and fishing in the vicinity of the Galapagos Islands late in July, an Ecuadorean mission was sent there to greet him. The Ecuadorean legations in Bolivia, Argentina, and Mexico were closed in January as an economy measure.

EDUCATIONAL PSYCHOLOGY. See PSYCHOLOGY.

EDUCATION IN THE UNITED STATES. Enrollments. The U.S. Office of Education estimated the enrollment in the elementary schools was 22,400,000 in September, and that there were 6,750,000 students in the high schools. About 2,000,000 children entered the first grade and a like number entered high schools for the first time.

There continues to be a decrease in the number of pupils in the elementary schools. Until 1934 there were increases in the high-school enrollments sufficient to make the total enrollments in public schools show an annual increase. Since then there has been a steady decrease. The effect of this decrease is manifest in many cities. In many places fewer teachers are employed in the elementary schools. There are idle elementary school buildings in some places, and frequently cities are finding it necessary to relocate school buildings in order to meet changing population trends.

Educational Conditions. Much effort has been devoted during the year to the improvement of the curriculum of the elementary school. In general this has involved the attempt to bring the learning that is expected in school into closer relationship with the conditions that are found outside the school. This, it is believed, will result in better and more effective citizens.

The sixteenth *Yearbook* of the American Association of School Administrators was devoted to "a school curriculum organized around the problems of life which the youth face instead of around a core of mathematics, languages, history, and formal literature." Five "core areas" were proposed. They are: Social relations, the home, vocations, creative arts, and recreative arts.

The third and several following *Yearbooks* of this same organization were concerned with the curricula of the schools. During the dozen years that have elapsed since the earlier reports, there have been constant attempts to revise and improve the work of the schools. Thousands of new curricula have been developed and printed. Great numbers of teachers and school administrators have spent their summers in schools and colleges where the major emphasis was upon "curriculum construction." Curriculum specialists have appeared and been employed by cities and by states. This recent *Yearbook* makes very drastic criticisms

against the results of all this expenditure of money, time, and energy. The authors state:

Instead of vitalizing school life by tying it up directly with the things pupils see and do outside of school, the school persists in maintaining an academic atmosphere so remote from actual life that the student usually thinks of his home and community activities as one type of life and his school activities as entirely another.

In the discussion that accompanied the adoption of the *Yearbook*, the following criticisms were urged against the existing curriculum:

It is remote from the student's daily life; it is not adjusted to modern needs; it does not reflect the aspirations of youth; it takes little account of individual differences among students; it has not kept pace with developments of psychology, and it gives too little attention to emotional and social attitudes which often play a larger part in human behavior than intellectual pursuits.

As matters now stand there is substantial agreement as to what the schools should achieve. This is usually stated in the broad and indefinite term, "better citizens." There are, however, two antagonistic views as to how the school may attain the desired end. According to one there is a definite body of knowledge, the possession of which is basic to good citizenship. It is the function of the school to select this knowledge and then to encourage, and if necessary to compel, pupils to learn it. For the sake of convenience this prescribed subject-matter is divided into sections that form the work of each of the school years. The school makes careful efforts to determine what portion of the work assigned to each year is achieved by the pupils in that year. If it appears that the individual has done 75 per cent or more, he is "passed" to the next year or grade. If he does not show the necessary 75 per cent achievement, he may be kept in the same grade for an extra year or he may be placed in a special class of dull or backward pupils.

Schools in which this view of the way to produce good citizens is in effect, do often take up "extra-curricular" activities when time permits. Even these are carefully planned by the school. Often they are of such a nature that pupils must be stimulated to follow them by credits and rewards. It is expected that the learner will become a good citizen by constantly fitting into a fixed scheme that he has had no part in determining.

The other view holds that the good citizen is developed by having him participate in all the affairs that concern him. This means that there can be no fixed subject-matter that all must learn. The more radical advocates of this view oppose daily assignments of lessons. They insist that the program for the day must be determined as the need for action arises. Least of all do they desire a time schedule such that a fixed number of minutes may be devoted to each subject. They hold that children learn effectively only as they are able to make use of what they are learning.

The name most commonly used to designate this group is "progressive educators." They make use of an "activity program" and frequently employ "units of subject-matter." All elementary education has been greatly influenced by the theories of progressive education, but there have been few places in which the plan could be completely adopted. Adults, who received their education under the older plan, usually are suspicious of any scheme that lacks the prescriptions and supposed disciplinary aspects that characterized education in their school days. Such people are not satisfied with the results that schools are now obtaining. There is evident a strong desire to know more about educational matters.

Dr. Frederick P. Keppel, in his report as presi-

dent of the Carnegie Corporation, states that there is "a growing desire on the part of the thoughtful public for some understanding of fundamental educational problems." Dr. Keppel criticizes educational technicians "who, like all technicians, tend to think first of influencing one another, and easily slip into the use of a technical jargon which is confusing and exasperating not only to the layman but also to the educator of broader interests. The educational evangelists are also responsible for much confusion and misunderstanding. Particularly in view of what is going on before our eyes elsewhere in the world today, every American must welcome the fullest discussion of the relations between our education and our social order. He must wish to hear and to understand both those who would assign to education and to educators a much more active part in influencing that order, as well as those of opposite opinion. Unfortunately the utterances of the educational evangelists are today often just as cryptic as those of the educational technicians." This criticism exposes the cause of the school people's failure to make significant changes more rapidly.

Report of the Advisory Committee on Education. This committee was appointed by the President on Sept. 19, 1936. Its purpose was then to make a study of the experiences of the existing program of Federal aid for vocational education. Later, Apr. 19, 1937, the President requested the committee to consider the broader subject of Federal relationship to state and local conduct of education, and to prepare a report. A report was submitted to the President, Feb. 18, 1938, and 10 days later transmitted by him to the Congress.

The committee studied the abilities of the different states to raise funds by taxation for education. It applied, in modified form, the model state and local tax system proposed by a committee of the National Tax Association. The report shows that, when this system is applied, the revenue available in the United States as a whole is \$51.77 per child. More than 60 per cent of the children of school age in the United States live in states that on a state-wide basis could not provide \$50 per child for public education without more-than-average effort. About 20 per cent of the children live in states where not more than \$25 per child could be provided without heavier-than-average taxes. As regards actual expenditures 35 of the states are spending more per child for education than the proposed plan of taxation would produce.

The committee, taking into consideration the inability of states and localities to raise by approved rates of taxation the sums needed for adequate educational programs, offers its proposals for Federal aid. The report deals with a six-year period beginning July 1, 1939, and ending June 30, 1945. Eight different aspects of public education are considered. The proposals are as follows:

General aid for elementary and secondary education \$40,000,000 for the fiscal year 1939-40, this to be annually increased by \$20,000,000 until the total becomes \$140,000,000 for the year 1944-45. These grants would be available to the States for all types of current and maintenance expenses of the public schools. The committee believes that the Federal grants should also be available for such activities as library service, health welfare, and recreational activities; preprimary training; services for handicapped pupils; educational and vocational guidance; vocational education; provision for books and other reading and instructional materials; the transportation of pupils; and scholarships. It is suggested that many of the services of the public schools might be available to children who may be enrolled in private or parochial schools. Such services would include transportation of pupils, purchase of books, and health and welfare services. Such services, however, would be optional with the individual States.

The improvement of teacher preparation \$2,000,000 for

the year 1939-40, this to be increased by \$2,000,000 annually to a maximum of \$6,000,000.

Construction of school buildings to facilitate district reorganization \$20,000,000, this to be increased after the first year to \$30,000,000.

Administration of state departments of Education \$1,000,000, for 1939-40, this to be increased by \$500,000 annually to \$2,000,000.

Educational services for adults \$5,000,000 for 1939-40, this to be increased by \$5,000,000 annually to \$15,000,000.

Library service for rural areas \$2,000,000 for 1939-40, this to be increased by \$2,000,000 annually to \$6,000,000.

Co-operative educational research, planning, and demonstrations \$2,000,000 for 1939-40, this to be \$3,000,000 each year thereafter.

Vocational education is also considered, but owing to the fact that the Federal aid for this purpose now is \$21,785,000 annually, no recommendation is made for added grants. The total of all the Federal grants exclusive of that for vocational education would be \$72,000,000 for 1939-40, increasing to \$202,000,000 in 1944-45.

Survey of the Public Schools of New York State. An Inquiry into the Character and Cost of Public Education in the State of New York was authorized by the Board of Regents in 1935. With a gift of \$500,000 from the General Education Board, a committee of the Regents, with Owen D. Young as chairman, employed a group of outstanding educators to conduct the survey and to report to the Regents. Their report was submitted in November. It will receive wide attention because the findings are significant outside the boundaries of New York State. Major consideration is given to the school systems outside of New York City.

Those who conducted the survey first determined what the state wanted and needed from its schools. These objectives are stated as follows:

On the basis of the evidence, these are the things that the State of New York wants and needs from its educational system, stated in the simplest terms. It wants and needs universal educational opportunity, a democratic not a class plan of education, character-building education, good teachers, useful and up-to-date schooling, the removal of obstacles to adult education, and at all times efficiency and economy. These together represent the educational objectives toward which the State should now direct its undivided energies.

The report states that "not all communities are getting their money's worth for the taxes which they pay for schools." It asserts:

Waste and extravagance arise from (1) the great number of small elementary and high schools due to the antiquated district system, (2) the unnecessarily small size of classes throughout the State except in New York City, (3) badly planned and over-luxurious school buildings with big debts and high interest payments over long years and too much semi-idle plant, (4) inattention to possible economies in ordinary business administration, and (5) certain elements of the State aid formula which encourages spending and discourages economy.

As remedies for waste and extravagance the following proposals are offered:

Greatly reduce the number of small schools through home rule plan of district modernization (presented in the report) and through the elimination of unnecessarily small classes in all school districts, plan school buildings better with reference to future needs and economies of administration and maintenance, and substitute approval by the Commissioner for the existing unnecessary and expensive legal requirement of forced ventilation.

Add a business manager to the staff of all large school systems under the direction of the superintendent, strengthen financial and business advisory service in the State Department and introduce more co-operative services, modernize the budgeting accounting and purchasing system of all schools.

Reduce interest costs on local school buildings by using the pay-as-you-go policy where possible or by borrowing for fewer years, and permitting school districts to borrow direct from the State at the low rate of interest that the State pays.

There is a summary of possible economies which would be sufficient to pay for such improvements

as are proposed, and not increase the aid that the state must furnish. The economies are as follows:

By eliminating unduly small classes	\$ 6,500,000 to \$24,900,000	
By improving purchases and reducing insurance rates	2,000,000	2,000,000
By improving debt management and reducing future interest rates	13,000,000	13,000,000
By revising school ventilation laws	150,000	150,000
By reducing costs in line with decreasing elementary enrollments	16,500,000	16,500,000
Totals	\$38,150,000	\$56,550,000

The report asserts that the school system of the state is failing in many particulars. The plan proposed for improving conditions is outlined as follows:

(1) Revision of the secondary school program by incorporating the seventh and eighth grades and adding two extra years beyond the twelfth grade. Other more minor changes include discontinuance of regents' examinations, increasing the compulsory school age from 16 to 18, except for children able to find jobs; abolition of continuation schools and greater provision for education of the gifted and the handicapped.

(2) Alteration of the elementary school program by the addition of free kindergartens, limitation of size to from 180 to 600 pupils, and the providing of free textbooks for all children.

(3) Consolidation of the 7000 school districts of the state into fewer and larger units to eliminate duplication of services and eliminate waste of money.

(4) Introduction of more economic administration of schools by eliminating small buildings and small classes, ceasing to erect ill-planned and over-luxurious schools, and altering the state-aid formula which now encourages spending.

(5) Change in the basis of State aid so that local schools will receive state funds according to the number of children enrolled instead of average daily attendance. Also a provision to check extravagance by requiring state approval for any school system which spends more than \$160 a year a child or in which State aid equals half the budget.

(6) A series of new policies to insure the improvement of the training and ability of teachers. These include competition for appointment and promotion for all teachers, addition of a fourth year to teacher training colleges, improvement of facilities and personnel of normal schools at a cost of \$8,000,000, appointment of an advisory committee to redraft courses now offered in these colleges, and increases in scholarships offered to student teachers. Also, to attract children of ability to teaching, extension of tenure rights to all teachers, raising of minimum salaries in rural schools from \$800 to \$1200, and the establishment of compulsory retirement with pension rights at the age of 65.

(7) Increases in the number and amount of State scholarships for colleges and universities to compensate for the lack of free higher education in the State. The inquiry suggested that the present number, 3000, be doubled and that the stipend be raised from \$100 to \$300. It also urged the addition of 100 graduate fellowships of \$400 each.

(8) Encouragement but no State aid for the extension of various independent adult education projects.

New York has the reputation of having a highly state-centered public school system. There are few matters that are of concern to the local schools that do not require approval by the State Department of Education. It is interesting to note the recommendations that the survey staff has made in respect to the Department itself. The term "home rule" is frequently used in the report. It urges that the Board of Regents act as follows:

Adopt *leadership based on research* as the central objective of the State Education Department and in conformity with this policy reduce service and regulatory actions to the minimum, and eliminate dictatorial administrative policies completely, particularly in dealing with local educational problems, teachers, teacher education, and the colleges.

Discontinue all standing committees of the Board of Regents so that the Regents may act as a whole, and devote their entire attention to major matters of policy.

EGYPT. A kingdom of northeastern Africa. Capital, Cairo. Ruler in 1938, Farouk I, who succeeded to the throne Apr. 28, 1936.

Area and Population. Excluding the Anglo-Egyptian Sudan (q.v.), Egypt has an area of about 386,000 square miles, of which only about 13,600 square miles along the Nile are occupied. The estimated population on June 30, 1937, was 15,904,525 (preliminary). The 1927 census showed a population of 14,217,864. Populations of the chief cities at the 1937 census (preliminary) were: Cairo, 1,307,422; Alexandria, 682,101; Port Said, 126,907; Tanta, 94,421; Mansûra, 68,637; Asyût, 59,925; Damanhûr, 61,791.

Religion and Education. Of the 1927 population, 91 per cent were Moslems, 8.34 per cent Christians, and 0.45 per cent Jews. Arabic is the official language and is used by most Egyptians. About 88 per cent of the adult inhabitants were illiterate in 1927. The school attendance in 1937 was 1,308,252.

Production. Agriculture supports about 62 per cent of the population directly. The area devoted to crops and orchards in 1935-36 was 8,408,909 acres. The yields of the chief cereals in 1938 were (in metric tons): Wheat, 1,250,000; barley, 232,700; corn (1937) 1,645,400. Production of other crops in 1937 was: Rough rice, 18,181,000 bu.; onions, 618,156,000 lb.; sugarcane (1936), 1,127,000 metric tons; cane sugar (1937-38), 138,000 metric tons; cotton (1937-38), 494,700 metric tons. Livestock statistics for 1936 include 995,000 cattle, 932,000 buffaloes, 1,496,000 sheep, 14,000 swine, 754,000 goats, 155,000 camels, and 794,000 asses. Mineral production in 1937 was (in metric tons): Phosphate rock, 517,002; petroleum, 170,860; manganese iron ore, 186,320; talc, 2266; pumice stone, 2811; carbonate and sulphate of soda, 2300; nitrate shale, 11,305; fine gold (ounces), 1226. The fishing industry in 1936 employed 49,104 persons and comprised 9535 boats. Tourists visiting Egypt during 1937 numbered 48,480.

Foreign Trade. In 1937 imports for consumption were valued at £E38,016,000 (£E31,496,000 in 1936) and exports of Egyptian products at £E38,665,000 (£E32,971,000 in 1936). The respective figures in United States gold dollars were \$113,819,000 (\$94,813,000 in 1936) and \$115,763,000 (\$99,252,000 in 1936). The chief imports in order of value in 1937 were cotton, fertilizer, coal, coke and briquets, machinery, and other textiles. Raw cotton exports (1937) were \$147,019,000 (paper); cottonseed, \$9,378,000; onions, \$6,823,000. Of the 1937 imports, the United Kingdom supplied 21.8 per cent; Germany, 11 per cent; Italy, 8.6 per cent; United States, 5.6 per cent; France, 4.5 per cent. The United Kingdom took 32.2 per cent of the exports; France, 11 per cent; Germany, 8.6 per cent; Japan, 6.4 per cent; Italy, 6.2 per cent, and the United States, 4 per cent.

Total imports for 1938 were £E36,934,000; total exports, £E29,342,000 of which cotton accounted for £E21,189,500.

Finance. For the fiscal year ending Apr. 30, 1939, the budget estimates placed receipts at £E38,843,000 and expenditures at £E40,932,000. For 1937-38 actual receipts amounted to £E37,148,111 and expenditures to £E36,332,328. Actual receipts for 1936-37 were £E35,502,850; expenditures, £E34,193,038. The consolidated public debt was £E88,139,000 on Dec. 31, 1937. After the devaluation of the pound sterling in 1931, the Egyptian pound (£E) was pegged at approximately 102½ per cent of the pound sterling and fluctuated in constant ratio with the latter currency.

Transportation. In April, 1937, there were 2764 miles of government-owned railway lines (excluding sidings) and 976 miles of private lines. In

1936-37 the government railways carried 36,515,459 passengers and 1,034,632,155 ton-miles of freight. Gross receipts were £E5,196,832. Highways in 1937 extended 5013 miles; number of automobiles on Jan. 1, 1938, 31,212. An extensive highway-construction program was under way in 1938. Cairo is an important aviation center with airlines radiating to South Africa, Europe, and Asia. During 1937, 10,097 ships of 35,318,511 net registered tons entered Egyptian ports, landing 4,620,855 tons of cargo.

Government. The Constitution of Apr. 19, 1923, abrogated on Oct. 22, 1930, was restored on Dec. 12, 1935. It provided for a Parliament of two houses—a Senate with 132 members in 1938, two-fifths nominated by the Crown and three-fifths elected by universal male suffrage, half for five and half for 10 years, and a Chamber of Deputies with 232 members elected for five years. At the beginning of 1938, the Wafd (Nationalist party) held 186 seats in the Chamber and 99 seats in the Senate. For developments in 1938, see *History*.

HISTORY

Internal Politics. The year 1938 was marked by a sensational shift of political power from Mustafa Nahas Pasha and his majority faction of the Wafd to opposition elements led by Premier Mohammed Mahmoud Pasha and working in close cooperation with King Farouk. The basis for this change was laid during 1937 by the repudiation of Nahas Pasha's leadership by Mahmoud Nokrashi Pasha and a minority of the Wafd members of Parliament. A subsequent clash between Nahas Pasha and the King led to the former's dismissal as Premier on Dec. 30, 1937, and the formation of a ministry under Mohammed Mahmoud Pasha representing all political parties except the Wafd (see 1937 YEAR BOOK, p. 227).

The Wafd, however, retained its overwhelming majority in both houses of Parliament and denounced the Mahmoud Ministry as unconstitutional. To avoid the Wafd's parliamentary obstruction, Premier Mahmoud obtained from the King a rescript adjourning Parliament for 30 days. This was read in the Chamber on the night of Jan. 3, 1938, by the Wafdist Speaker, Dr. Ahmed Maher, a brother of the King's chief adviser, Ali Maher Pasha. The Wafdist Deputies drowned out the Speaker's words by a riotous tumult and the Chamber then proceeded to vote a resolution of non-confidence in the Mahmoud Government by 180 to 17 votes. The Senate voted 83 to 4 in favor of a similar resolution.

Despite Wafdist protests, Parliament was adjourned and when the month's time limit was about to expire, the Chamber of Deputies was dissolved (February 2) and new elections were called for early in April. Premier Mahmoud had hoped during the month's adjournment to win over enough Wafdist to obtain a majority in the Chamber. A group of about 50 Deputies deserted Nahas Pasha and went over to the government along with Ahmed Maher, who was expelled from the Wafd on January 4 for reading the King's rescript adjourning Parliament. Ahmed Maher joined with Nokrashi Pasha and other dissident Wafdist to form a new party called the Saadist Wafd after Saad Zaghlul Pasha, leader of the Egyptian nationalist revival. But the loss of this group left Nahas Pasha still with a substantial majority in the Chamber.

Fearing the result of the voting with Premier Mahmoud Pasha in control of the election machinery, Nahas Pasha petitioned the King to appoint a

non-partisan ministry to supervise the elections. Farouk refused, with the result that manipulation of the electoral machinery and official pressure produced a sweeping victory for the supporters of Mahmoud Pasha's government. The government parties won 99 seats in the Chamber, the Saadists 84, the Independents 68, and the Wafdists, under Nahas Pasha, only 12. A correspondent of the *London Times* reported that the elections "were not conducted with the promised freedom and impartiality." The campaign was exceptionally bitter and about 12 persons were killed in election day clashes. Nevertheless it was indicated that Nahas Pasha and the Wafd had lost ground rapidly among the voters as a result of his conflict with the popular young King and his refusal to work with other experienced Wafdist leaders. The Wafd had also been left without effective campaign issues following the achievement of its independence program through the Anglo-Egyptian treaty of 1936.

The new Parliament was opened on April 12. The speech from the throne, read by Mahmoud Pasha, promised constitutional government, adequate national defense, and extensive internal reforms. It also affirmed Egypt's loyalty to the British alliance. Mahmoud's Cabinet was reorganized on April 27 following extended discussions with the King's advisers. Another reorganization took place on June 24 when Mahmoud Pasha formed a new ministry including for the first time representatives of the Saadists.

Farouk's Popularity. The waning influence of Nahas Pasha and his previously all-powerful Wafd was due in no small measure to the great popularity of Egypt's young King and to the quarrel between the two arising from the Wafd leader's attempt to curb the royal prerogatives. The ceremonial investiture of the King on his 18th birthday on July 29, 1937, was followed by another round of festivities in celebration of Farouk's marriage to Miss Sasi Naz Zulficar, 16-year-old daughter of a judge of the Alexandria Mixed Court of Appeals, on Jan. 20, 1938. Another celebration took place on November 17 upon the birth of a daughter to the royal couple. These events and the democratic tendencies evidenced by the King combined to enhance his influence.

The Defense Program. In accordance with the Anglo-Egyptian alliance of 1936, a British military mission arrived in Egypt in 1937 to train and supervise the re-equipment of Egyptian military forces in order that they might assume a greater share of responsibility for the defense of Egypt and the Suez Canal. During 1938 the mission reported good progress in the reorganization of the army along modern lines. Substantial supplies of artillery and machine guns were received from Great Britain, thus removing the Egyptians' suspicion that Britain was unwilling to trust them with modern weapons. The scope of the mission was expanded to permit commencement of work on coast defenses at Alexandria and Mersa Matruh. The mission also assumed responsibility for organizing and training a Frontiers Administration force.

In his speech to the new session of Parliament on November 19 King Farouk made known the government's decision to strengthen the air force, create an Egyptian fleet, construct factories for making munitions, light arms and airplanes, and take further steps to develop an effective armed force. A bill establishing three-year military conscription of all Egyptian youths was introduced. On November 29 the government voted to spend

£1,023,000 on six mine-sweepers, six torpedo boats and a coast guard vessel as the first step in a two-year program for the construction of 36 fleet units at a cost of £3,500,000.

Premier Mahmoud Pasha and a delegation went to London in July to iron out differences that had arisen over application of the Anglo-Egyptian alliance. An agreement initialed early in August revised the alliance in several minor details. The principal change was Britain's agreement to pay one-half of the cost of the barracks to be erected in the Suez Canal Zone for British troops. The cost was estimated at £E5,000,000. The barracks agreement was signed at Alexandria September 22. While in England the Egyptian Premier also sought to reach an agreement with Lancashire cotton manufacturers on Egyptian cotton tariffs. As no immediate accord was possible, a Lancashire delegation arrived in Cairo in September to continue negotiations with the Minister of Finance. Meanwhile on Dec. 29, 1937, Egyptian troops returned to the Anglo-Egyptian Sudan to resume joint control of that territory with the British administration and early in 1938 the Egyptian Government announced that it would terminate its annual payment of £E750,000 for the defense of the Sudan now that it was sharing the defense burden directly with Britain.

Foreign Relations. Mahmoud Pasha's government worked in close co-operation with the British in strengthening the national defense. On March 24 Prime Minister Chamberlain reiterated Britain's pledge to defend Egypt against aggression from any source. This was reciprocated by the Egyptian Government during the crisis over Czecho-Slovakia in September. Mahmoud Pasha asserted before Parliament on September 26 that Egypt would fulfill its obligations under the Anglo-Egyptian alliance if Chamberlain's peace efforts failed.

Wafdist Deputies strongly attacked the Anglo-Italian agreement of April 16 (see GREAT BRITAIN and ITALY under *History*) and the action of the Egyptian Government in signing it. They charged that Egypt had been again treated like a colony and asked to sign on the dotted line after the two European powers had reached agreement on the Suez Canal regime, Lake Tsana, and the frontiers between the Anglo-Egyptian Sudan and Italian East Africa. Mahmoud Pasha replied that the Egyptian Government had been kept fully informed of the negotiations by the British. Ratification of the Anglo-Italian agreement late in the year greatly relieved Egypt's fear that a war in which Britain and Italy might become involved would find her unable to defend her territory.

The treaty of friendship signed with Turkey in 1937 was ratified April 11. On August 29 the United States formally renounced the extra-territorial rights that its citizens had enjoyed in Egypt for over 100 years, the United States Senate having ratified the Montreux Convention of 1937 on June 13, 1938. Despite the Egyptian alliance with Britain, Egyptians took a growing interest in supporting the Arab cause in Palestine during the year. In May the growth of anti-Jewish propaganda among Arab political refugees from Palestine and among the Palestinian and Syrian students at the great Al Azhar (Moslem theological) University at Cairo led the government to warn these groups to cease their activities on pain of deportation. Egyptian students, however, continued anti-Jewish and pro-Arab demonstrations. An Egyptian Parliamentary Committee for the Defense of Palestine

was organized and on October 7 it convoked a congress in Cairo in furtherance of its aim.

EIRE. See *IRELAND*.

ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF. A national organization founded in 1884 for the purpose of advancing the theory and practice of electrical engineering and the allied arts and sciences and of maintaining a high professional standing among its members. There are three grades of members: Associate, member, and fellow. The membership on Nov. 1, 1938, was 16,564.

In September, 1938, there were 65 sections of the Institute located in various cities throughout the United States and 120 student branches in colleges giving courses in electrical engineering. In addition to district, section, and student branch meetings, there were held an annual winter convention in New York City, Jan. 24-28, 1938, and an annual summer convention in Washington, D. C., June 20-24, 1938. Much of the Institute's work is accomplished through its general and technical committees, of which there were 39 in 1938. Its principal publications are the monthly *Electrical Engineering*, the *Standards* of the A.I.E.E., and the *Year Book*.

The officers elected for 1938-39 were: President, J. C. Parker; vice-presidents, C. L. Dawes, F. M. Farmer, A. H. Lovell, F. C. Bolton, L. R. Gamble; directors, L. R. Mapes, H. S. Osborne, D. C. Prince; national treasurer, W. I. Slichter; national secretary, H. H. Henline. Five other vice-presidents and nine other directors were held over from previous elections. Headquarters are in the Engineering Societies Building, 33 West 39th St., New York City.

ELECTRICAL ILLUMINATION. The fluorescent Mazda lamps that became commercially available early in 1938 were hailed as the greatest contribution to light production since the introduction of the tungsten filament for incandescent lamps. Although similar in size and appearance to the familiar lumiline lamps, these new lamps utilize an entirely different principle, that of an electric discharge through an atmosphere of ionized mercury vapor between electrodes at the ends of the tubes. The ultraviolet radiations of this typical mercury arc activate the chemical salts, or "phosphors" with which the *insides* of the tubes are coated. Available colors range from the truest artificial daylight so far produced, through a variety of previously unavailable pastel tints, to solid colors. Efficiencies are notable: White, more than double that of the best incandescent; red, about 5 times; blue, 60 times; green, 210 times. Colors are produced by the "additive" principle of converting the invisible ultraviolet radiations directly into luminous colors by the phosphor coatings in the tubes, which coatings become the actual sources of visible light. Hence the contrast in efficiency with the incandescent lamps where colors are producible only by using subtractive filters to absorb the unwanted colors constituting the normal "white" light of the lamp. Other characteristics of the fluorescent lamps: Low intrinsic brightness and low temperature of tubes; small ballast or starting transformer required because the initial voltage required is higher than the operating voltage. Technically, they are classified as the preheated-cathode low-voltage type. Within but a few months these new lamps have found many applications.

A "midget sun," a 1000-watt, 840-volt mercury lamp, has an arc about an inch long and approx-

imately the thickness of a toothpick that attains a brightness of about 30,000 candles per square centimeter. This tiny arc light operates with an efficiency of some 65 lumens per watt and requires about three quarts of water per minute to keep it cool. Important uses in the photoengraving and blueprinting fields now are apparent, and others no doubt will develop. The 65,000-lumen lamp complete with its water jacket is only some 6 in. long and 1 in. in diameter. Other mercury-lamp developments include the improvement of units to be used in combination with incandescent lamps for "daylight" effects; "sunlamp" improvements; "black light" radiators of ultraviolet for decorative, commercial, theatrical, and photographic uses in connection with fluorescent inks, paints, etc.; ultraviolet sources for the irradiation of foods and for certain germicidal purposes such as sterilizing the air in a hospital room.

The limit for incandescent lamps available with the medium (ordinary) screw base has been increased from 200 watts to 300, thus enabling the use of higher levels of commercial and industrial lighting without costly fixture replacements. Similarly, reductions in the physical size of lamps of lower wattages have been made. New in construction is a 150-watt lamp which embodies as integral parts a reflector and lens that produce a 25-deg. beam of light suitable for commercial spot-lighting indoors or out. A similar lamp suitable for indoor flood lighting embodies only a reflector. Bi-post lamps, formerly available only in sizes of 750 watts and larger, now are available in 500-watt size. For 16-mm. motion picture projection, an increase of 50 per cent in screen illumination has been attained with a new 1000-watt lamp designed to have a shorter life but greater efficiency. A new 250-watt, 125-volt "lamp" is designed to radiate heat for paint and other drying purposes.

Lighting for highways and streets is gaining wider recognition as an important factor in the safe operation of motor vehicles at night. In New Jersey alone some 200 miles of highway were illuminated, including what is now the longest continuous stretch (more than 50 miles) of such highway, between Camden and Atlantic City. Other States officially active include Illinois, California, and Minnesota. Detroit, still holding No. 1 place among cities, has installed more than 250 miles of new arterial street lighting since late in 1936. Other cities active in improving the levels of street illumination include Cleveland, Boston, Hartford, Portland (Ore.), and Los Angeles. In Greensburg, Pa., each street and alley throughout the city was surveyed and relighted, in keeping with actual traffic requirements. Tunnels lighted during the year with sodium-vapor luminaires include the twin Liberty Tubes in Pittsburgh, Stockton Street tunnel in San Francisco, and the McCallie Avenue tunnel in Chattanooga.

Sport, industrial, and decorative lighting have kept pace with the general advancement. A rayon plant in Painesville, Ohio, uses some 55 kilowatts in luminaires to produce an illumination level of 13 ft.-candles throughout its working area. Ebbets Field (baseball), Brooklyn, N. Y., has a nighttime illumination level of some 100 ft.-candles provided by 615 1500-watt Mazda floodlights. At Laidley Stadium (football), Charleston, W. Va., average intensity on the playing field is some 59 ft.-candles, obtained from 150 1500-watt units. Decorative lighting is showing the effects of the imaginative stimulus provided by the Golden Gate Exposition at San Francisco and the 1939 World's

Fair at New York. Airway illumination developments are typified by the 11,000,000-candle-power beacon that will reach 85 miles out to sea to greet transatlantic fliers at the new 4000-acre Newfoundland airport.

The trend in electronic tubes for the generation of high-frequency radiations for X-ray, industrial radiography, beam transmission for radio, and experimental work has been toward greater powers and relatively smaller sizes. The newest ultra-high-frequency tube can deliver 200 watts at 200 megacycles (115 meters), about double the output available previously from an air-cooled tube. This is significant for directive-beam transmission and for scientific studies. A compact shock-proof portable X-ray unit no larger than a traveling bag may be carried about by a doctor for emergency use at a patient's home.

The American Recommended Practice of School Lighting was published early in 1938 under the joint sponsorship of the Illuminating Engineering Society and the American Institute of Architects and approved by the American Standards Association.

The first practical application of the 50-kw lamp previously announced was reported during the year in a motor-car manufacturer's research laboratory to permit inspection of full-scale models under high-intensity single-source illumination. For the photographer, several new and smaller photoflash lamps of improved synchronizing characteristics, and a new line of enlarger lamps ranging from 75 to 500 watts in size, have been announced.

The sale of incandescent lamps for 1938 is reported as 485,000,000 large lamps and 315,000,000 miniature lamps. The 1937 figures were 515,000,000 and 440,000,000 respectively.

ELECTRICAL INDUSTRIES. Production in the electrical manufacturing industry (about \$1,600,000,000) was off by about 33 per cent from the level of 1937 (but above the 1935 level) as compared to a drop of 23 per cent in general business for the same period. Using production for the year 1925 as 100 per cent, statistical reports for 1938 show the Federal Reserve Board general production index at 80, population at 113, electrical manufacturing production at 97, and employment at 90. On the same basis, 1938 production of small appliances stood at 91, refrigerators at 786, industrial apparatus at 98, power-generating apparatus at 81, power transmission and distribution equipment at 96, insulated wire and cable at 66, and electrical material at 77. The 60th anniversary of one of the large electrical manufacturing companies was celebrated in 1938. This inspires pause for a realization of the fact that the electrical devices upon which the world now depends so widely were largely unknown within the life span of many people now living.

With the avowed objective of expediting the provision of increased power facilities as a war-time measure and in anticipation of increasing peace-time requirements, the Subcommittee on Standardization of the National Defense Power Committee has for the first time in the history of the electrical industry established "preferred standards" for condensing steam turbine-generators in nine sizes ranging from 10,000 to 100,000 kilowatts, and for eight sizes for superposition ranging from 10,000 to 60,000 kw. It is the committee's expressed intention that these standards, agreed upon by representatives of government, manufacturers, and utilities, will be followed in the building of all machines for new stations and for all possible

machines to be added to existing stations, anticipating that the cost of installation throughout the industry as a whole will be reduced sufficiently to compensate for any economic or other advantages that might accrue to any one installation from the individual or "tailor made" installations that have prevailed in the past.

Steel-mill electrification has continued, 1938 being a year of consolidation of progress and the completion of several important projects. A new slabbing mill, having a pair of horizontal rolls and a set of vertical edging rolls built into one stand, sets a record for a single mill by its 13,000 h.p. in three d-c motors. The largest d-c motor in Canada is a new 7000-h.p. unit driving a 46-in. blooming mill. A new hot-strip mill has turned out long runs at 2000 ft. per min., and a new cold-strip mill is capable of cold-rolling strips up to 94 in. in width at speeds up to 800 ft. per min. Electrical "tensiometers" now control the tension of strips during rolling. For the necessarily close inspection of the paper-thin steel sheets used for "tin" cans, photo-electric tubes ("electric eyes") now are used to detect minute holes at a speed the equivalent of some 5000 milk, beer, or soup cans per minute. A new continuous-catenary electric strip-annealing furnace is capable of handling as many as seven strips at once, and of maintaining temperatures as high as 2000 deg. F. New electric furnaces have controlled internal atmosphere to obviate undesirable chemical changes in such products as tool steels, high-grade silicon iron, or copper of high density and purity. Ball-mill (ore-crusher) bearings of moulded plastic, lubricated with water, have been found to reduce required mill-power by as much as 30 per cent because of lower friction, and to last longer than traditional metal bearings. The first use of ignitron-type rectifiers in the electrochemical industry occurred in 1938.

Air conditioning, largely dependent upon electrical devices for control and operation, is continuing its rapid growth. Many new buildings have been designed to provide air-conditioned office and public areas. More air-conditioned trains and buses made their appearance in 1938, and air-conditioned travel is beginning to be taken for granted by the public. For commercial and domestic installation, air-conditioning units have become "packaged" items ranging in capacities from 1 to 15 or 20 tons, self contained in every respect and requiring only power, air, and water connections for operation. Some of these provide also a supply of cooled drinking water. Domestic refrigerators have been improved in operating efficiency, utilitarian arrangement, and appearance; special units to serve farmers' needs have been developed. Electric sub-soil heaters have been used for sweet potato curing, effecting a closer and consequently more profitable control of temperature, and obviating fire hazard. Domestic electric ranges have been improved by such features as one-piece porcelain bodies, more durable and more easily cleanable heating units, and automatically controlled "cooker pot" units.

The \$220,000,000 Colorado River aqueduct of the Metropolitan Water District of Southern California in its sixth year of construction in 1938 was brought to approximately 95 per cent completion. Its five pumping plants are designed to be capable of raising 1500 cu. ft. (11,220 gal.) of water per second, a total of more than 1600 ft. The initial installation, expected to be in operation in 1939, includes two 82,500-kw generators at the Boulder power plant, six 12,500-h.p., three 9000-h.p., and

three 4300-h.p., 6900-volt synchronous motors, comprising a third of the ultimate capacity of motors and half the District's ultimate assignment of generating capacity at Boulder Dam. Statistics on farm electrification vary according to source, but it seems probable that approximately 30 per cent of the nation's 1,250,000 farms having dwellings valued in excess of \$500 were wired for electric service by the close of 1938. A 200-acre "typical farm" in northwestern New York State was turned into a "farm laboratory" equipped with a full complement of electrical devices in house and barns for the handling of farm operations ranging from milking to concrete mixing. Full operating records will be kept to determine the efficiency and economy of broad power utilization on a farm.

New laboratory tools developed for the conduct of research in the field of nuclear physics include an enormous belt-type electrostatic generator or "atom smasher" (previously reported), the main part of which was completed during the year. A "mass spectrograph" picks ions formed in a gas by electronic bombardment and passes them through a combination of electrostatic and electromagnetic fields in a large vacuum tube in such a way as to sort out the ions according to their ratio of charge to mass. Small crystals of alloys about the size of a pencil will be developed in a new laboratory vacuum furnace so that the elastic properties of single crystals of these alloys may be studied electrically. The study of three-dimensional stress distribution by the method of photo-elasticity is made possible by a device in which a model made of a transparent plastic is studied under stress conditions by means of polarized light which forms visible patterns representing the lines of stress.

A gas-filled electric power cable was introduced in 1938. Inert gas also was applied to certain totally enclosed induction motors intended for operation in the explosive atmospheres encountered in oil-refinery service, the gas under pressure preventing the infiltration of the explosive atmosphere. Fiberglass fabric, a new insulating material for electrical apparatus, found its way into broader applications, especially in motor windings subject to high temperatures and in equipment subject to heavy duties such as railway and industrial crane motors. An accelerated trend toward a wider use of carrier current for communication, power-line protective relaying, remote control, and remote metering purposes was apparent in 1938. The new Thomas A. Edison Memorial Tower at Menlo Park, N. J., was dedicated in February.

ELECTRICAL MACHINERY. With the pioneer hydrogen-cooled turbine-generator, little more than a year old, 1938 closed with some 750,000 kilowatts of such generators in service, ranging from 25,000 to 150,000 kw in size. Such machines are totally enclosed, and advantage of this feature was taken with a 75,000-kilovolt-ampere unit in Pittsburgh which may be placed under gas pressure to exclude water from its windings in the event of a flood such as occurred in 1936, thus expediting the restoration of the machines to service. Improvements in materials and technique since 1929 have made possible the ever-increasing size of high-speed machines and have resulted in some striking economies. For example, for each 1000 kw of capacity, a 25,000-kw 1800-r.p.m. machine weighs some 16,000 lb. and requires 21.5 sq. ft. of floor space whereas a 3600-r.p.m. machine of the same capacity weighs but 7300 lb. and occupies but 10.9 sq. ft. per 1000 kw. Significance of these developments is indicated by the fact that of 17 major machines

placed in operation in 1938, 13 operate at 3600 r.p.m. Largest 3600-r.p.m. machine reported was rated at 58,825 kv-a. Hydrogen cooling is of particular advantage in high-speed machines because hydrogen reduces friction and windage losses to one tenth of the values encountered with air.

New features on a 25,000-kv-a hydrogen-cooled synchronous condenser include turbo-type construction common to high-speed generators, operation at 3600 r.p.m. instead of the more usual 720 or 900 r.p.m., excitation supplied by an ignitron rectifier instead of the usual rotating d-c generator.

Water-wheel generators also made news during 1938. At Boulder Dam the fifth and sixth 82,500-kw units were placed in service and the building of two more similar units was begun. At Bonneville Dam two 48,000-kv-a 75-r.p.m. vertical units were ready for operation. At Guntersville Dam three 27,000-kv-a 69.2-r.p.m. units were under construction. Two 40,000-kv-a 81.3-r.p.m. generators were ready for service at Pickwick Dam about the same time that the 64,000-kv-a 120-r.p.m. machines for the Hiwassee Dam were being designed on the drafting tables. Among those being built for export are three 70,000-kv-a 125-r.p.m. 50-cycle units for Manchoukuo.

Under development for the Government's Grand Coulee project are units expected to deliver 108,000 kw. Ultimate design of the projected twin-power houses will accommodate 18 such units. Bids were requested by the U.S. Bureau of Reclamation covering four 75,000-kw units for installation at the Shasta Dam on the Sacramento River in northern California.

Matching the increasing popularity of the Diesel engine, a line of generators ranging in size from 30 to 60 kw at 1200 r.p.m. has been designed especially for direct connection to such engines, for small isolated installations. Several power transformers of the order of 40,000-kv-a capacity were placed in operation. A previously announced development in distribution transformers made available commercially during 1938 permits the core to be machine-wound around the transformer coils from a continuous strip of cold-rolled steel in a fraction of the time required for the conventional hand assembly of laminated cores.

A 2500-h.p. induction motor placed in operation during the year on a large mine hoist rates as the largest induction motor in such service in America. Other unique features of the installation include d-c control, 3600-ft.-per-min. hoisting and 3300-ft.-per-min. lowering speed, and dynamic d-c braking. Three 1250-h.p. 13,200-volt synchronous motors with magnetic forward, reverse, and dynamic-braking controls are rated as the largest and highest voltage motors and controls to be used so far to drive automobile-tire manufacturing machinery. These motors are completely enclosed and each has its own closed-circuit ventilating system equipped with air coolers. What is reputed to be the largest 4-speed squirrel-cage induction motor was built to deliver 2000 h.p. to drive a propeller capable of producing a 400-m.p.h. wind in a college aerodynamics laboratory. This motor requires 12,000 cu. ft. per min. of air from a 40-h.p. blower just to keep it cool.

Many improvements were effected in protective and control devices of importance to electric power systems. A new design of induction voltage regulator with control devices, completely self contained and 20 per cent smaller, may be installed either indoors or outdoors. The number of Petersen Coils (for neutralizing transmission-line

ground faults) in service by the end of 1938 was half again the number in service at the beginning of the year. Advances made in heavy-duty oil circuit breakers include greater interrupting capacities and increased operating speeds that will help to reduce service interruptions. Metal-clad switchgear has been improved in operating characteristics, reduced in bulk and weight by welded steel construction. A safety-type switchboard for power-plant or industrial applications resembles a multiple tier of small lockers, a circuit breaker in each locker with the operating handle protruding through the door. As a unit is withdrawn from its compartment, it automatically is electrically isolated and ready for safe service work. A small but important development is a non-bouncing contact for electrical protective relays. To the eye, this contact looks like any other silver contact, but in actuality it is hollow and partially filled with grains of tungsten, the interfriction between which absorbs the energy of impact. This important little development is of especial significance in carrier-current relaying, where positive contact action is particularly important. A mathematical concept led to a drastic simplification of pilot-wire protective relaying schemes that extended the range of their application.

A motor-driven multiple-commutator device has been developed, the purpose of which is to simulate repetitively such transient conditions as exist on a power system under fault or switching conditions. This device in conjunction with an alternating current network calculator greatly facilitates the analytical study of power-system problems.

Steel-enclosed mercury-arc rectifiers during 1938 were improved in design and simplified as to auxiliary equipment. Typical units placed in operation during the year include a 26,000-ampere 515-volt installation in an electrochemical plant; additional units for underground service in a coal mine; a 3000-kw 625-volt unit for a New York subway system, one of the first installations of the ignitron-type for transportation service, and the largest of this type installed to date. For the San Francisco-Oakland Bay Bridge railway electrification, mercury-arc rectifiers totaling some 20,000 kw of capacity were installed to serve trolley voltages at both 1300 and 625 volts.

The trend of development in electric meters and instruments for 1938 continued in the direction of more accurate measurements and control with greater precision, and of extending measurements and control into new fields. The measurement of current at high frequencies was simplified by a new thermocouple ammeter. A new electric gauge measures the thickness of nonmagnetic coatings of a few thousands of an inch, such as enamel, over steel parts. At the other limit in electrical measuring devices is a new eddy-current inductor-type dynamometer capable of measuring accurately the thousands of horsepower developed by large engines.

Electrical instruments have played their full part in the rapid development of aviation. A new gasoline gauge transmits magnetically the indications of a float arm within the gasoline tank, thus obviating the possibility of leakage. By the use of the d-c Selsyn principle as many as eight different indications may be obtained on one instrument of only 3/4-in. diameter. An automatic engine-speed synchronizer developed for use on multi-engine planes, holds several engines very closely to identical speed by varying the pitch of the propellers.

ELECTRICAL MARINE ENGINEERING. Setting a new record in the American mer-

chant marine for high steam pressure, two new turbine-electric tankers have boilers delivering 625-lb. steam at 825 deg. F to 4500-kilowatt turbine-generators. A third similar ship is under construction to operate with 900-deg. steam. Geared Diesel-electric propulsion, a new type of drive, was introduced on tugboats operating in and out of New York harbor. On each vessel two 400-kw engine-generator sets serve two geared propulsion motors which deliver 1000 horsepower to the propeller shaft to drive the vessel at 13 knots. Late in the year work was started on additional Diesel-electric tugboats to be of 3000 h.p. each. To measure the horsepower or the horsepower-hours being delivered through a ship's propeller shaft, a new electric device accurately detects and translates the twist in a measured length of the propeller shaft.

A new 2220-kw Diesel-electric fireboat for the city of New York has two 1500-h.p. engine-generator units, two 1000-h.p. propulsion motors, and four 600-h.p. motor-driven firepumps each having a capacity of 5000 gal. per min. at 150-lb. pressure. An elaborate electrical-control system provides complete flexibility for operating equipment in various combinations as required. Construction of the Diesel-electric propelling equipment was completed during the year for four U.S. Coast Guard cutters intended for ice breaking and harbor work. An electromagnetic air-gap coupling or clutch capable of transmitting 3000 h.p. at 400 revolutions per minute was completed during the year and will be used to advantage for marine propulsion where Diesel engines and reduction gearing are used instead of electric drives. New steam-turbine gear-driven tankers will have a complete alternating-current electric-power system for the operation of pumps, winches, and other auxiliary equipment. On a U.S. Army Engineer Corps construction dredge 3000-h.p. 300-r.p.m. induction motors operating directly from 13,200-volt shore lines were installed to drive the dredging pumps. General marine electrical trends noted for 1938 in addition to those already noted include the use of centralized group control for auxiliary motors on large vessels, a trend toward the use of Class B insulation on propelling motors and generators because of the resultant higher permissible operating temperature and corresponding lower weight and saving in space, a trend toward "dead-front" switchboard construction using deionizing or other enclosed types of circuit-breakers instead of exposed fuses or knife switches.

ELECTRICAL TRANSMISSION AND DISTRIBUTION. More than 5100 miles of new transmission lines were constructed in 1938, almost exactly the same as actually constructed for 1937 and nearly three times the total constructed during 1936. New substation capacity amounted to 2,749,000 kilovolt-amperes as against 2,611,000 for 1937 and 926,000 for 1936. Another 237-mile 230-kilovolt transmission line was completed from Boulder Dam into southern California for initial service to the five pumping stations along the Colorado River Aqueduct of the Metropolitan Water District of Southern California. Extensive flood damage to transmission and distribution facilities was suffered by southern California power companies in March, 1938. Similarly, power lines in the eastern portion of Long Island and through New England suffered severe damage in the hurricane of September, 1938. Reconstruction work dramatically demonstrated the great advantages of standardized equipment and practices. Engineers at a meeting of the Edison Electric Institute in May undertook

to define the rating of all power-system equipment.

Studies of natural lightning, and portable facilities for imposing artificial lightning impulses on transmission systems and the study of the effects thereof, have contributed toward a better understanding of the subject and more effective means for protecting lines and equipment from lightning damage. The growing importance of Petersen Coils (fault "neutralizers") as an economical and reliable method of protection is evidenced by the fact that one manufacturing company alone reports the production during 1938 of seven new units, about 50 per cent of the total number in operation at the beginning of the year. A new line of capacitors of water-proof construction was developed for circuits up to 15 kv, such units being an essential part of the impulse protective equipment for a-c motors and generators on systems exposed to lightning. A new outdoor fuse for service up to 600 volts for the protection of individual distribution transformers, etc., gives a visual indication when it has operated.

With the installation of expulsion-type protector tubes on a 220-kv transmission line, a new circuit voltage record was established. These units protect the insulators against impulse flashovers. New 230-kv high-speed oil-circuit breakers under test on a 220-kv 50-cycle system demonstrated their ability to interrupt as much as 1,800,000 kv-a in intervals of time ranging from 1.37 to a maximum of 4.2 cycles. To reduce contact resistance, silver-to-silver line-pressure contacts were incorporated at all joints in a new metal-clad switchgear. Improvements in network protectors and other protective relays enable them to give more certain and dependable operation in shorter time intervals when trouble conditions occur on lines or in equipment. Gas-filled power cables have been installed in New York City, representing an outstanding development of the year in this field. This cable is expected to show advantages in installation and maintenance.

ELECTRICAL TRANSPORTATION. The Pennsylvania R.R. early in 1938 completed its electrification of main-line passenger and freight routes east of Harrisburg to Washington, Philadelphia, and New York. All passenger and freight trains east of Harrisburg now are operated electrically, and the railroad had under construction at the close of 1938 some 20 more passenger locomotives to augment its motive power on these divisions. The electric locomotives developed for handling freight trains at speeds as high as 70 miles per hour used the same single-phase 11,000-volt series commutator-type motors as used for passenger service, with design improvements that enable them to deliver more power at greater speed for given sizes and to withstand heavier overloads for starting duty than previous motors; under test a freight locomotive rated at 5000 continuous horsepower produced the equivalent of 10,000 rail h.p.; with a load of 140 tons on its driving axles it had a starting tractive effort of 70,000 lb.

Tests made on new electric passenger locomotives for the New York, New Haven and Hartford R.R. placed in service during 1938 demonstrated their ability to maintain fast schedules with heavy trains of 16 standard cars. Normally rated at 3600 h.p., these locomotives are capable of heavy overloads for short periods. A new 1000-h.p. Diesel-electric Burlington "Zephyr" under construction will have a small Diesel-electric power plant on each car to provide independent air-conditioning. For the San Francisco-Oakland Bay

Bridge, new lightweight trains were developed for both the Southern Pacific (1200-volt trolley) and for the key system (600-volt trolley and third rail).

Quite aside from the matter of motive-power requirements for modern high-speed trains is the matter of electric power required in the passenger cars. Whereas the conventional passenger car has required only from 2 to 4 kilowatts per car, the requirements of electrical energy for heat, air-conditioning, light, ventilation, water cooling, and other apparatus now amount to about 50 kw per car on a modern streamlined train—a total requirement of some 600 kw in auxiliary power for a 12-car train. This seems likely to lead to alternating-current train-lines of perhaps as high as 2300 volts.

Something new in railroad locomotives is represented by the 5000-h.p. twin-unit steam turbine-electric locomotive completed late in 1938 for the Union Pacific R.R. A specially designed high-pressure oil-burning boiler furnishes steam at 1500 lb. pressure to twin condensing turbine-generators which supply power for the traction motors. In appearance this new locomotive is not unlike the new Diesel-electrics. Foreign railroad developments included manufacture in the United States of new 185-ton electric passenger locomotives for 3000-volt d-c service on the Paulista Rwy. in Brazil, rated at 4200-h.p. and capable of 90 miles per hour maximum speed. For industrial service, small Diesel-electric locomotives ranging in size from 20 to 45 tons provide the ease and control of operation typified in the larger units on main-line roads.

Records for 1938 show the increasing popularity of the new type of street car known as "President's Conference Committee" car (see 1935 YEAR BOOK). Since the first fleet was placed in operation in Brooklyn, N. Y., two years ago, nearly 800 cars of this type have gone into service in 10 of the larger cities. Another important vehicle for mass transportation is the modern trolley coach, first used in Salt Lake City ten years ago and now spread to 40 other localities with an aggregate of more than 2000 such vehicles in operation. A new bus for heavy-duty service has a 2-unit articulated body with 8 wheels on 4 axles and with 2 driving motors served by a single engine-generator set. A new bus motor uses a compound instead of a series winding, facilitating the use of automatic regenerative control and electric braking for service as well as emergency stops. A 1938 development for New York subway-elevated service is a 3-car 4-truck unit about 80 ft. long, weighing 70,000 lb., and providing seats for 84 passengers and aisle space for 234 persons to stand. This unit adapts motors, control, and braking equipment successfully demonstrated on the P.C.C. car, is intended for high acceleration and rapid retardation, and is designed for operation with as many as seven 3-car units in a single train.

Other phases of transportation deserve mention in passing. One is the further improvement of floor selectors and automatic leveling equipment to improve the safety and facility of the modern high-speed elevators required for modern skyscrapers. Another is the installation in New Hampshire of North America's first aerial tramway, up the 6000-ft. slope of a peak popular with mountain climbers and winter-sports enthusiasts.

ELECTRIC LIGHT AND POWER. In the United States the total electric energy generated by the electric light and power industry during 1938 was some 109 billion kilowatt-hours (on the basis of 10 months' records and two months' esti-

mates). This compares with 115 billion in 1937, 106.5 in 1936, and 90 in 1929. Another 4.85 billion kw-hr from the aluminum and paper industries, from government hydroelectric plants, or from across the Canadian border brought the total power handled on private and municipal utility systems to nearly 114 billion kw-hr for 1938. Of this amount about 2 per cent was required for company uses, and 16 per cent was absorbed in carrying the remaining 82 per cent through the transmission and distribution systems to the ultimate consumers. Of the total energy generated for electric power systems in 1938, some 62 per cent was produced in steam-electric generating plants and 38 per cent in hydroelectric plants; in 1937 these percentages were respectively about 65 and 35.

Of the 93.4 billion kw-hr delivered to ultimate consumers, 67 per cent went to commercial-industrial customers, 18 per cent to residential customers, and 2.6 to farm users. Utilization in all divisions represented a substantial increase over that of 1937 with the exception of industrial usage where a drop of more than 17 per cent accounted for the industry as a whole showing 5 per cent under 1937. The 1938 sales of electrical energy represented a billed value of \$2,172,750,000, essentially the same as that of 1937, and compares with \$1,938,520,000 in 1929. The average consumption per residential customer in 1938 was 850 kw-hr at an average rate of 4.2 cents per kw-hr as compared to 499 kw-hr at a rate of 6.3 cents in 1929. The number of electric-power customers increased during 1938 by approximately 601,500, bringing the total to a new high of 27,765,480, classified as follows: 1,410,000 farm; 22,010,000 residential; 4,242,000 commercial-industrial; and 103,480 municipal, railroad, and miscellaneous.

Federal power projects now under development are scheduled to have an ultimate capacity of some 6,400,000 kw, equivalent to approximately 18 per cent of the present rating of private electric light and power plants, and for the most part competitive with them. The 455,400 kw in such projects brought into operation during the year brings the total in Government projects now in operation up to about 1,175,000 kw. As of November, 1938, a total of 480-odd Government rural electrification projects had been allotted a total in excess of \$160,500,000. Of these, 315 have been placed in service. By the end of 1938 more than 150,000 rural customers were being served with electric power from some 70,000 miles of lines constructed with funds provided by the Rural Electrification Administration. For 161 municipal power projects involving a total estimated cost of nearly \$46,000,000 the PWA during 1938 authorized loans totaling nearly \$6,000,000 and grants in excess of \$20,000,000. Fifty of the projects are competitive with existing private utilities, 104 already were municipal plants, six communities had not previously been served. During the year several private utilities under threat of direct government competition sold properties to local governments which in most instances were fortified with Federal funds. The most notable case was the consummation of a sale by Wendell Wilkie of the Commonwealth and Southern property in TVA territory to the Government for a sum adequate to liquidate the interests of investors.

Rate reductions during 1938 represent savings to consumers of \$16,100,000. An ever-increasing tax bill against utility properties, amounting to \$338,000,000 in 1938, some 16.7 per cent of estimated gross revenue, sent the over-all operating ratio to

a new high of 53 per cent, although the net operating ratio exclusive of taxes was by skillful utility management kept for 1938 at the 37.7 per cent figure of 1937.

Expenditure of capital for new utility construction in 1938 amounted to \$433,035,000 as compared to \$455,480,000 for 1937, \$133,519,000 for steam-electric generating capacity, \$14,467,000 for hydroelectric generating capacity, \$39,070,000 for transmission-line construction, \$217,162,000 for distribution construction, and \$28,817,000 for miscellaneous items. Financing required during the year amounted to some \$962,000,000, approximately 90 per cent of which was for refunding purposes.

A total of 1,695,908 kw in new electric generating capacity was reported for 1938, more than for any year since 1930. In steam-electric generating stations, 50 private companies reported 9 new plants totaling 143,000 kw and additional capacities totaling 1,085,735 developed in existing plants; 19 municipalities reported 2 new plants totaling 7000 kw and additions totaling 91,500 kw in 17 existing plants. In hydroelectric plants, 14 private companies reported 5 new plants totaling 80,685 kw in capacity and additions totaling 17,120 kw in 9 existing plants; 2 municipalities reported 2 new plants totaling 10,800 kw; the Tennessee Valley Authority reported a capacity of 72,000 kw in new plants; the U.S. Bureau of Reclamation added 165,000 kw in generating capacity at the Boulder Dam power plant. In internal-combustion-engine plants, 10 private companies reported additions totaling 13,154 kw to existing plants; 4 publicly owned systems reported 1 new plant of 5000 kw capacity and additions totaling 4910 kw to 3 existing plants.

Of especial interest in the foregoing figures is the fact that nearly 90 per cent of the new steam-electric generating capacity was provided in existing plants. This development represents two trends: First the replacement of obsolete and inefficient equipment, and second the decided trend toward the superposition of high-pressure "topping" units. Seven installations of topping turbines operating at high temperatures and pressures accounted for a total new capacity of more than 300,000 kilovolt-amperes. Power-plant capacities can be increased from 40 to 100 per cent, with paralleling improvements of from 35 to 50 per cent in heat rate, by the superposition of such machines. Total fuel-power production in 1938 from all plants (industrial and railroad as well as central station) producing energy for public use amounted to 71,584,000,000 kw-hr and accounted for the consumption of 40.2 million tons of coal and gas and oil the equivalent of another 10 million tons. Average thermal economy continued its unbroken trend, only 1.42 lb. of coal being required per kw-hr as compared to 1.43 for 1937 and a progressively higher rate to 1.69 for 1929 and 3.2 for 1919.

Freak weather conditions in various parts of the United States during 1938 caused severe flood and other damage to electric generating plants and power distributing systems in mid-continent, New England, New York, and California, demonstrating at once on the one hand the vital nature of electric power in modern life and on the other hand the effectiveness with which power service was restored in affected areas. This latter was greatly enhanced by system interconnections whereby supplies of power from unaffected areas could be brought into areas the local sources of which had been destroyed or disabled. The effectiveness of broadly standardized equipment and methods in the

matter of quick restoration of service was most strikingly demonstrated in the restoration of utility services in the New England hurricane area. Men and materials were mobilized from the whole eastern portion of the country.

Tentative plans for the integration of power system properties in voluntary compliance with section 11(B) of the Holding Company Act were received in great numbers toward the close of 1938 by the SEC in recognition of its tentative deadline of December 1. These plans contemplate the coordination of properties into sectional units (east, west, south, or midwest) regardless of the intermediate holding companies, and the sale or intertrading of small holdings not logically related to major sectional groups. Holding companies are starting out slowly, preferring to rearrange their systems piece by piece rather than by means of one general upheaval. The Commission's official attitude toward these interpretations and procedures is still to be determined. To explain what is meant by "integration," one company's plan contemplates re-grouping its far-flung properties into three reasonably well unified geographical systems, one in the Northwest, one in the South, and one in the East, most of the properties in these groups being either already interconnected or susceptible of interconnection for operating purposes. With the filing of these plans in 1938 with the SEC, the 1935 Public Utility Holding Company Act entered its third stage. The first stage ended in January, 1938, with the Supreme Court ruling upholding the constitutionality of the registration provision of the act. The second stage came to a close with the filing of tentative plans as mentioned. The third stage may see the actual beginnings of integration of the various systems and certainly will see many commission rulings and judicial decisions.

ELMIRA COLLEGE. An institution for the higher education of women in Elmira, N. Y., founded in 1855. The enrollment for the autumn of 1938 was 362. There were 51 members on the faculty. The endowment of the college amounted to \$1,063,731, and the income for the year, exclusive of gifts, was \$288,386. During the session of 1937-38 gifts amounting to \$4969 were received. There were 46,500 volumes in the library. President, William S. A. Pott, M.A., Ph.D.

EMIGRATION. See IMMIGRATION.

EMORY UNIVERSITY. An institution for higher learning in Atlanta, Ga., coeducational only in the upper division of the college and in the graduate and professional schools (except the school of medicine), founded in 1836. The enrollment for the autumn of 1938 was 1538. The 1938 summer session had an attendance of 797. The faculty numbered 254. The endowment amounted to \$5,480,736, and the income for the year was \$755,156. There were 159,124 volumes in the library. The university operates Emory junior colleges at Oxford, Ga., and Valdosta, Ga., duplicating the work of the first two undergraduate years on the Atlanta campus. President, Harvey W. Cox, Ph.D., LL.D.

EMPLOYMENT. See UNEMPLOYMENT.

ENDERBURY ISLAND. An island $2\frac{1}{2}$ miles long and 1 mile wide, located in the Pacific Ocean approximately in latitude $3^{\circ} 7' N.$, and longitude $171^{\circ} 3' W.$ from Greenwich, claimed by both Great Britain and the United States. Offering a

flat surface suitable for the development of an airfield, the island came into prominence in 1937 as a prospective base for airlines between Canada, the United States, and Australasia. Great Britain, by an Order-in-Council of Mar. 18, 1937, incorporated the Phoenix group (including Enderbury) in the Gilbert and Ellice Islands colony. The United States claimed that the island had been discovered by American whaling ships a hundred years ago. On Mar. 3, 1938, President Roosevelt signed an executive order which laid formal claim to Enderbury and Canton Islands of the Phoenix group. An understanding was reached between the United States and Great Britain in the pact of Aug. 10, 1938, in which they agreed to leave the question of title in abeyance for a protracted period of time. The islands are to be controlled by a joint Anglo-United States regime, each party being assured of equal rights in the use of the islands for aviation and communications.

ENGINEERING. See BOILERS; BRIDGES; CANALS; DAMS; ELECTRICAL MACHINERY; GARBAGE AND REFUSE DISPOSAL; PORTS AND HARBORS; TUNNELS, ETC.

ENGINES. INTERNAL COMBUSTION. The bulk of Diesel engines produced in the United States during the past two years has been in sizes under 150 h.p. For certain kinds of service these have been marked by lighter weight and higher speeds. Two large automobile manufacturing groups have entered the Diesel field with a standardized design in several capacities for application to trucks, tractors, and buses. The railway field is also employing a number of Diesels of large capacity for fast Diesel-electric trains and for switching locomotives.

A limited number of heavy-duty Diesels of medium capacity have gone into stationary service. To date the largest Diesel engines that have been built in this country are the 7000-h.p., eight-cylinder, two-stroke cycle, double-acting units installed several years ago at Vernon, Calif., and more recently at Salt River, Ariz. These are greatly exceeded in size by a number of engines abroad, the largest of which is a 22,500-h.p. unit in Copenhagen, Denmark. About 20 engines, from 1000 to 3000 h.p., were built or ordered in the United States during 1938, including both stationary and marine service.

The majority of engines between 1000 and 4000 h.p. are of the two-stroke-cycle type and above this capacity practically all operate on this cycle. Double-acting engines are confined to the two-stroke cycle, although many large two-stroke-cycle engines are single-acting. In most of the smaller sizes the four-stroke cycle predominates whereas for intermediate capacities both the two- and the four-stroke cycle are employed. Engine speeds of 120 to 150 r.p.m. prevail among the larger units while 1500 to 2000 r.p.m. are usual among the small high-speed engines.

During the past year further progress has been made in the simplification of designs and a greater degree of standardization has been carried out. Alloys and welding have been employed to a greater extent than heretofore, and controls have been perfected. Combustion chamber designs and fuel injection have been improved to better the performance of high-speed engines, vibration and noise have been lessened, and supercharging has received wider application, as has also the use of heat recovery equipment. Improvement in the refining and compounding of lubricating oils has been an important factor in operation and reduced maintenance.

Progress in the application of Diesel engines to the aviation field has been slow in this country, but

abroad, particularly in Germany, the Junkers opposed-piston type is being used extensively in fast passenger planes. These employ twin engines of 600 to 800 h.p. each. The German hydroplane which last year established a long-distance non-stop flight of 5000 miles to Brazil was propelled by four Junkers engines.

The distribution of natural gas to various sections of the country has been responsible for increased use of gas engines during the past few years. These are principally in small- or medium-size units for industrial applications, pumping, driving compressors, and to a lesser degree for driving electric generators. The widest use of such engines is in the Southwest and in California, the latter, according to figures compiled by the American Gas Association, having about 500,000 installed horsepower.

ENGLAND. See GREAT BRITAIN.

ENGLAND, CHURCH OF. In England, that church which is established and endowed by law as the national church. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). (For details of church government, see the *NEW INTERNATIONAL YEAR BOOK*, 1932.) In 1937 there were 2,372,079 Easter communicants in the 43 English dioceses. Incumbents numbered 12,645 and assistant curacies, 4527. The total voluntary parochial contributions amounted to £1,219,-872.

The year 1938 was notable as Bible Year and as the year in which the Doctrinal Report was published. In spite of grave difficulties created by the Tithe Act, it was a year of steady consolidation. The year was observed as Bible Year in commemoration of the Royal Injunctions issued in 1538 to all the parochial clergy that they should each "provide one book of the whole Bible of the largest volume in English and the same set up in some convenient place within the said church that you have cure of, whereas your parishioners may most commodiously resort to the same and read it." The celebrations culminated in a great National Service of Thanksgiving for the English Bible held in St. Paul's Cathedral on June 17. World-wide interest was roused by the publication on January 14 of "Doctrine in the Church of England," being the Report of the Commission on Christian Doctrine appointed by the Archbishops of Canterbury and York in 1922. In November, 1938, the Church Assembly instructed the Central Board of Finance "to initiate and carry out a scheme for raising at least £50,000 for the help of Christian refugees."

The Royal Assent was given during the year to the following Measures passed by the Church Assembly: The Guildford Cathedral Measure, 1938, which transferred the dignity and status of the Cathedral of the Diocese from the Church of the Holy Trinity to the Church of the Holy Spirit in course of erection; The Marriage (Licensing of Chapels) Measure, 1938, which removed a doubt which arose as to the extent of the powers conferred upon a bishop in connection with the licensing of chapels in Conventional districts; The Parsonages Measure, 1938, which consolidated and amended the law in respect to the sale and acquisition of Parsonages. It repealed the Parsonages Measure, 1930; The Ecclesiastical Commissioners (Powers) Measure, 1938, which conferred further powers, mainly of an administrative character, upon the Ecclesiastical Commissioners; The Liverpool City Churches Act, 1897 (Amendment) Measure, 1938, which amended the Liverpool City Churches

Act, 1897, and enabled the Ecclesiastical Commissioners to make grants from the "Building and Endowment Capital Fund" for the building or endowment of churches or for the purchase of sites near to as well as actually within the boundaries of the City of Liverpool; The Faculty Jurisdiction Measure, 1938, which, without altering the essential character of the faculty jurisdiction, made that jurisdiction more effective in those cases where it is now disregarded, and afforded greater protection to ancient churches, associated the archdeacons with the work of the Consistory Court and gave them some independent authority, especially in the matter of repairs, and gave statutory recognition and statutory functions to the Diocesan Advisory Committees. Final approval was given to the Premunire (Appointment of Bishops) Abolition Measure; Diocesan Officers Remuneration Measure, and Queen Anne's Bounty (Powers) Measure.

At the summer session the budget of the Church Assembly was introduced by Earl Grey, the Chairman of the Central Board of Finance, and was approved. It provided for the expenditure of £145,000 and included the following items: Contributions to the Clergy Pensions Scheme; Grants for Religious Education, including Church Training Colleges; Training for the Ministry, Ordination Candidates; Maintenance of Assistant Clergy in understaffed Parishes; Contribution to the Fund for Pensions for Widows and Dependents of the Clergy; Central Loan Fund; Expenses of the Church Assembly and its Committees, Boards, and Commissions; and the expense of the two Convocations. The whole of the £500,000 forming the Central Loan Fund was applied for, and advances amounting to £198,000 were made to 30 dioceses during the year. The largest applications came from the dioceses of Liverpool and Sheffield.

The subjects before the Convocations of Canterbury and York included the Doctrinal Report; an important scheme for declaration of the meaning of "Lawful Authority" in the Declaration of Assent; the Appointment of Bishops; Deaconesses; Church and Marriage; Church and Youth; the Church in Germany; Reunion; Road Dangers; the Status of the Clergy; Exchange of Benefices; Cremation; Preparation for Confirmation; Chaplains in Public Institutions; Education; the Status and Work of Lay Readers; a Guild of Vergers Benevolent Society; Baptism, Godparents, and the Report on Youth; the Ministry of Women; Co-operation between Doctors and Clergy; the Contraceptives (Regulation) Bill.

The Coal Act, which was passed in July, placed important responsibilities on the Ecclesiastical Commissioners for the protection of coal-interests belonging to the Church. Under the terms of the compulsory acquisition of coal presented by the Act the Commissioners will experience a substantial reduction of income when their present rights cease in 1942. In October, the first and major portion of the 15th Rehousing Scheme undertaken in London by the Commissioners was completed and the block (at Maida Vale) was opened by the Bishop of London. Queen Anne's Bounty were engaged throughout 1938 in settling with the Tithe Redemption Commission the amount of tithe, benefice by benefice, for which they were entitled to compensation under the Tithe Act, 1936. The total capital loss which the Church faced as a result of this act was approximately £17,750,000.

The officers of the Church Assembly in 1938 were: Chairman, the Archbishop of Canterbury;

vice-chairman, the Archbishop of York; secretary, Sir Philip W. Baker-Wilbraham; assistant secretary, Guy H. Guillum Scott; chairman of the house of bishops, the Archbishop of Canterbury; chairman of the house of clergy, the Dean of Norwich; chairman of the house of laity, the Earl of Selborne. Temporary headquarters are at Parliament Mansions, Orchard Street, Westminster, S.W.1, London, England.

ENGLISH LITERATURE. See **LITERATURE, ENGLISH AND AMERICAN.**

ENTOMOLOGY, ECONOMIC. The year 1938 was marked by a continued spread of some of the insects introduced in recent years against which every means of control warfare has been marshaled by Federal and State agencies co-operating. The pink bollworm of cotton, held in check along the Rio Grande for many years following its spread from Mexico, has moved from the lower valley to the north in Texas and has extended its invasion westward in Arizona. The destructive bark-beetle-transmitted Dutch elm disease continued to spread and threatens destruction of the country's majestic shade tree. The injury to forest and shade trees that survived the West Indian hurricane which swept a large part of New England on September 21 was of far-reaching importance. Not only was the direct loss from that storm staggering but by breaking and exposing many new points in the bark and wood to invasion the storm increased their susceptibility to insect attack. This was of special importance as related to the possibility of further spread of the Dutch elm disease. The breakage in roots and branches weakened trees of many species and made it much easier for the various insect borers to attack them. The grasshopper plague and the Mormon cricket continued to cause great losses in the central and far western States. War against the ravenous white-fringed beetle was further organized and pressed in the four infested Gulf States.

Codling Moth Control. In the work with insecticides most favorable results have been obtained from the use of nicotine-bentonite in the Middle West as a substitute for lead arsenate in combating the codling moth. The tank-mix nicotine-bentonite was found to be equal to or better than lead arsenate in preventing worm entrance, was much better in controlling the sting type of blemish, and gave much less difficulty in residue removal. The increase in cost of this material appeared to be more than offset by the improvement in codling moth control and in the condition of the trees. Practical field experiments with orchard sanitation and banding have given reductions in infestation ranging from 20 to 60 per cent, demonstrating conclusively the value of these practices, especially under conditions of severe infestation. The use of bait traps reduced infestations from 20 to 50 per cent. The winter was passed by the pest with small loss over most of the country. Its development early in the spring portended a heavy infestation but cool weather late in May and early in June in most areas in the East and Middle West checked its activity and the infestation was about normal.

Corn Earworm Control. That this cosmopolitan pest which, through its attack upon the ears of sweet corn, is the bane of the housewife throughout the land may be held in check to a considerable extent was shown in preliminary experiments reported. By clipping off the tips of the ears about six days after pollination a maximum number of the earworm eggs will be removed from the silks at a time when few newly hatched worms have had time to penetrate the ears. This clipping method is

considered to afford the large commercial grower a chance to eliminate most of the worms at the rate of at least an acre per day per man and is much less costly than dusting. In cage experiments in Kansas it was found to survive the winter for the first time in the four years that cage observations have been under way and it also survived in Utah. It was reported as more generally distributed in Maine than for many years but otherwise was about normally abundant throughout the greater part of the country.

Dutch Elm Disease Control. Control work with the destructive bark-beetle-transmitted Dutch elm disease (see 1937 YEAR BOOK, p. 235) was pressed with great vigor. Inspections in 1937 had revealed some 25 per cent fewer trees infected than in the preceding year but in 1938 there was an extension of the infected area west into Eastern Pennsylvania and northward in New York State. More diseased trees were found than in any previous year due in part to the moisture and temperature conditions favorable to its spread. Upon discovery diseased trees were quickly removed and the causative fungus and bark-beetle vector present destroyed.

European Corn Borer. The spread of this pest continued and commercial damage was caused in Indiana for the first time. There was a tremendous increase in its infestation in southwestern Ontario in September, with indications of a greater abundance than at any time in a decade. Serious damage to sweet corn was reported from New England, New York, New Jersey, Ohio, and Indiana. A practical method of control on early market sweet corn was found after years of work by State and Federal entomologists. This consists in the application of one of the several promising insecticides, of which nicotine tannate solutions are most dependable, during the comparatively brief period the caterpillar spends on the outside of the plant. The application of the spray or dust must cover the leaves, emerging tassel, developing ear, junction of the leaf blades with stem, and tiller growth. Whether or not these insecticides can ever be recommended for borer control on canning corn and field corn depends on the results of tests in progress.

European Spruce Sawfly. There was a noticeable increase in the number of dead spruce resulting from the attack of the European spruce sawfly in the Gaspé peninsula of Quebec, where it was first discovered in North America in 1930 (see 1937 YEAR BOOK, p. 235). Its known distribution was greatly extended. An intense infestation was observed in New Hampshire with concentrated infestations throughout Maine, Vermont, and eastern New York.

Grasshopper Menace. The campaign against grasshopper devastation in the great grain-producing and grazing areas of the West, for which an appropriation of \$2,000,000 had been made by Congress, was continued. It was the first time since Federal-State co-operative control work to protect crops from grasshopper attack was begun that control forces were ready to halt the migrating bands before they could spread into fields and do crop damage. Every possible provision was made for maximum crop protection with a minimum amount of material. By the end of July effective poison baiting gave a very high degree of control throughout most of the infested area, especially where idle lands did not breed tremendous populations. In some sections of North Dakota, South Dakota, Wyoming, and Montana enormous populations of

the migratory grasshoppers developed in idle lands on which effective baiting was not accomplished. The general migration of adults began about July 4 and was observed at different times until the latter part of the month. Severe damage was done during August in a number of places in the Plains States with heavy migration into the Red River Valley of North Dakota.

In the 1938 campaign about 155,000 tons of mixed bait was used by 400,000 farmers on some 30 million acres of land and this furnished protection for more than 55 million acres of crops. The total crop saving was \$176,000,000 as estimated by State officials. Each of the participating States had a grasshopper control committee and a State leader who co-operated with the Federal Bureau of Entomology and Plant Quarantine and directed the work in the State. Participating counties were organized on both a county and a township basis, with county committeemen and leaders, as well as township or community committeemen and leaders. The co-operating States were responsible for mixing the bait materials and for the application of the bait. In several States WPA labor was available for mixing the bait. Thousands of mechanical spreaders were used for placing the bait in thin layers that were effective against grasshoppers but not dangerous to livestock or wildlife. The States participating were Arizona, Arkansas, California, Colorado, Idaho, Illinois, Iowa, Kansas, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, Wisconsin, and Wyoming.

That the pest will not be less troublesome in 1939 was predicted after the completion of the annual grasshopper-egg survey in the grain and range areas of the country. A study of the many species of grasshoppers occurring in nine western States during the preceding three years reported upon, revealed that their relative abundance is dependent upon changes in weather, food plants, and plant cover from year to year. Drought has a tendency to reduce populations of some species, whereas others are better able to withstand such conditions because they can survive on dryer native grasses. That a permanent reduction of the infestation by this pest is dependent upon a change in weather conditions was pointed out by the Chief of the Federal Bureau of Entomology and Plant Quarantine.

Gypsy Moth Control. In the New England area infestations of the gypsy moth were generally less severe than in the preceding year. A few egg clusters were found and destroyed by Canadian officials in the Province of New Brunswick across the international border from the infestation in Washington County, Maine. In New York the infestation discovered in 1937 in Putnam County was greatly reduced and only small isolated infestations were found in nine townships in the barrier-zone area. Scouting and treatment of the six infested counties of Pennsylvania was continued, with an improvement of conditions in the area of the State infested longest, although a few large colonies were found. No evidence was obtained of the presence of the gypsy moth in New Jersey. The regular funds appropriated for control were supplemented by allotments from emergency appropriations and provided for Federal WPA work with this pest in Vermont, Massachusetts, Connecticut, New York, New Jersey, and Pennsylvania.

Insect Control by the Giant Toad. The giant toad (*Bufo marinus*) first introduced into Puerto

Rico from Barbados in 1920 to combat the native white grubs and later into Hawaii and elsewhere, has been so effective that in Puerto Rico the grubs, which were the most serious and generally destructive insect pest of agricultural crops in the island, have practically disappeared from the lowlands and are only found in abundance in the mountainous section of the island to which the toad is not readily adapted.

Insecticides and Insect Control. Progress was made in the work of improving materials and methods employed in combating insects by chemical means. In addition to the improvement of commonly used insecticides attention was given to the development of new insecticides and particularly the determination and development of toxic compounds by synthesis. The development of a method of determining minute quantities of nicotine has greatly facilitated investigations to extend the use of insecticides made from tobacco. This method enables the specialist accurately to determine the amount of nicotine deposited on a single apple and makes it possible to ascertain any health hazard from such residues as well as to determine exactly the amount of deposit required to protect the fruit from insect pests. Nicotine bentonite, one of the compounds that have been developed, gives promise as a substitute for lead arsenate for control of the codling moth, especially in the Middle West, where it is being used rather extensively. Insecticides containing rotenone have been shown to be effective in the control of many insects. A 95 per cent reduction in infestation by the pea weevil in the Northwestern United States, where peas are grown for canning, has been obtained through the application of a rotenone-bearing dust mixture recently developed. Tests made of phenothiazine have shown it to possess outstanding insecticidal properties when used against the grape berry moth. The addition of nicotine insecticides to the last four cover sprays for the codling moth was found to control the unspecked tentiform leafminer (*Ornix prunivorella*) which has infested as high as 90 to 95 per cent of the leaves of the apple in the apple-producing region of northeastern Kansas. Experiments in California have shown that the grape leafhopper, a serious vineyard pest, is attracted by a pale blue light and may thus be lured and destroyed by flying against suspended high-tension wires.

Japanese Beetle. There was a general increase in the numbers of the Japanese beetle in the northern part of the infested area in New England and in much of the area south to the eastern shore of Maryland and Virginia. It was excessively abundant at points in the regions that had become infested within the last few years.

Mormon Cricket. The eggs of the Mormon cricket had largely hatched and in Colorado and Utah control operations commenced in May. During June it occurred in great abundance in Montana, Idaho, Utah, Colorado, Wyoming, Nevada, and Oregon and was extending its depredations farther eastward than before, injuring crops in Nebraska. Conducted as a crop-protection measure, the control work resulted in a greatly reduced population in a large number of large areas. It was estimated by State leaders that crop losses of approximately \$898,000 were caused by it in 1937. The control campaign against the pest in that year cost the co-operating stations and the Federal government slightly more than \$776,000 and saved crops with an estimated value of over \$7,500,000.

Peach Borer Control. In experiments with

ethylene dichloride emulsion as a control measure for the peach borer, the results were outstanding both as to borer control and safety for use on trees. It is effective at a much lower soil temperature than is paradichlorobenzene in crystal form or as an emulsion in cottonseed oil, and this greatly increases the length of the season for fall treatments in the Northern States.

Pink Bollworm of Cotton. The spread of the pink bollworm in the Lower Rio Grande Valley of Texas, where it was discovered in gin trash in 1936, continued, it having been discovered in the adjoining counties of Kleberg, Nueces, and San Patricio outside the valley despite the precautions taken to eradicate it. As one of the most destructive of crop pests it now seriously threatens the economic production of cotton. A slight infestation in the Santa Cruz Valley in Arizona near the Salt River Valley, where a heavier infestation had been eradicated, necessitated an extension of the Federal plant quarantine. Six entire counties and part of a seventh are now under quarantine for this pest in Arizona, 12 counties in New Mexico, and 37 in Texas. The importance of its continued spread is emphasized by the fact that in infested areas damage from its attack may reach from 30 to 100 per cent of the crop.

Psyllids and Psyllid Yellows. For some years a disease resulting from the introduction of a toxin by a psyllid or jumping plant louse (*Paratrioza cockerelli*) and known as psyllid yellows has caused a large loss to potato and tomato growers in Colorado, New Mexico, Wyoming, and other States. In Colorado it has caused a reduction in yield of 8,000,000 bu. of potatoes in a single year. Experiments conducted with a large number of varieties have led to the conclusion that there are inherent differences between potato varieties in their tolerance to this affection. The application of lime-sulphur mixture has been found to be an effective means of preventing the injury to potatoes. Dusting and wettable sulphurs applied against the psyllid gave an increase in tomato yield over that of untreated fields and were shown to be satisfactory insecticides for use in controlling it and preventing psyllid yellows.

White-Fringed Beetle. This South American pest first found in the United States in Florida in 1936 (see 1937 YEAR BOOK, p. 236), which cannot fly but is capable of causing tremendous damage in the grub stage, has been found to attack more than 160 varieties of plants. Cotton fields that were planted three times in an area where the pest was abundant produced only one half of a full crop. Surveys made during the year disclosed its presence in some new areas but the known infested districts are comparatively small. Every means for its control is being taken in the campaign against it being pressed by the Federal and State agencies co-operating.

Bibliography. The works of the year include: C. S. Brimley, *The Insects of North Carolina* (Raleigh, N. C., 1938); M. Colcord, *Index V to the Literature of American Economic Entomology* (College Park, Md., 1938); M. Neveu-Lemaire, *Traité d'Entomologie Médicale et Vétérinaire* (Paris, 1938); F. C. Pellett, *History of American Beekeeping* (Ames, Iowa, 1938); H. J. Quayle, *Insects of Citrus and Other Subtropical Fruits* (Ithaca, N. Y., 1938); and W. A. Riley and O. A. Johannsen, *Medical Entomology: A Survey of Insects and Allied Forms Which Affect the Health of Man and Animals* (New York and London, 1938, 2d ed.).

ERITREA, er'è-trā'ā. A former Italian colony in East Africa, incorporated with Ethiopia and Italian Somaliland into a single colony known as Italian East Africa by the decree law of June 1, 1936. See ITALIAN EAST AFRICA.

ESPIONAGE. See DENMARK, GERMANY, PANAMA, PANAMA CANAL ZONE, SPAIN, ETC., under History.

ESTONIA. A Baltic republic, established Feb. 24, 1918. Capital, Tallinn (Reval).

Area and Population. Estonia has an area of 18,359 square miles, including internal lakes, and a population estimated on Jan. 1, 1938, at 1,131,125 (1,126,413 at the 1934 census). The urban population in 1938 was 345,408 (323,007 in 1934). Living births in 1937 numbered 18,190 (16.1 per 1000 inhabitants); deaths, 16,650 (14.7 per 1000); marriages, 9585 (8.5 per 1000). Estimated populations of the chief cities on Jan. 1, 1938, with 1934 census figures in parentheses, were: Tallinn, 146,388 (137,792); Tartu, 60,104 (58,876); Narva, 24,183 (23,512); Pärnu, 21,468 (20,334).

Religion and Education. About five-sixths of the people are Lutherans and the rest Greek Orthodox, Roman Catholics, etc. At the 1934 census 3.9 per cent of the population 10 years of age and over were illiterate. School attendance in 1937-38 was: Primary, 106,859; grammar, 12,992; high, 3650; universities and other institutions for higher education (excluding military), 4077; professional, 9866.

Production. Agriculture and dairying support nearly 70 per cent of the population. Yields of the chief cereal crops in 1938 were (in metric tons): Wheat, 81,600; barley, 93,000; rye, 179,000; oats, 159,600. The potato crop in 1938 was 997,620 metric tons; linseed (1937), 396,000 bu.; flax fiber (1937), 22,643,000 lb. Livestock statistics for June 15, 1938, were: Cattle, 661,000; sheep, 650,000; swine, 385,000; horses, 219,000; poultry (over six months old), 1,991,000. The net value of industrial production was estimated at 113,000,000 crowns in 1938 (109,000,000 in 1937). The leading industrial products, with the amounts produced in 1937 where available, were: Cotton fabrics, cotton yarn, wood pulp (12,892 metric tons), cellulose (73,088 metric tons), paper (44,346,000 lb.), timber sawn in large-scale industries (9,894,000 cu. ft.), matches (56,000,000 boxes), oilshale (1,126,000 metric tons), electric current (133,000,000 kilowatt-hours in 1937; 150,000,000 in 1938).

Foreign Trade. Imports for consumption were 107,198,000 crowns in 1938 (111,062,000 in 1937) and exports of Estonian products were 103,923,000 crowns (106,012,000). The principal 1937 imports were, in order of value: Iron and steel and their manufactures, raw cotton, automobiles and chassis, textiles, electric apparatus, leaf tobacco. The principal exports were butter, pine lumber, chemical wood pulp, shale oils, cotton yarn, and flax. Of the 1937 imports, Germany supplied 26.1 per cent by value, United Kingdom 16.6, United States 8.2, and the Soviet Union 5.6 per cent. Of the 1937 exports, the United Kingdom took 33.9 per cent, Germany 30.5, Russia 4.1, and the United States 2.8.

Finance. For the fiscal year ending Mar. 31, 1938, actual budget returns were: Revenue, 99,703,253 crowns; expenditure, 99,576,810 crowns. For 1936-37 current receipts were 89,910,000 crowns; current expenditures, 74,090,000; capital receipts,

454,000; and capital expenditures, 16,002,000. Combined ordinary and extraordinary budget estimates for 1938-39 balanced at 99,300,000 crowns, excluding some state undertakings. The public debt on Jan. 1, 1938, was divided as follows: External, \$19,939,000, £1,669,000, and 7,380,000 Swedish crowns; internal, 12,329,000 Estonian crowns (estimated). The Estonian crown exchanged at an average rate of \$0.2703 in 1936 and \$0.2695 in 1937.

Transportation. In 1937 Estonia had about 891 miles of state-owned railways, excluding tramways; 13,359 miles of roads and highways; 4509 automobiles; and air lines connecting Tallinn with Helsingfors, Leningrad, Berlin, Warsaw, and other cities. For the 1937-38 fiscal year the state railways carried 11,500,000 passengers and earned revenues of 15,451,000 crowns. The gross tonnage of the Estonian merchant marine on June 30, 1938, was 177,100 (168,500 on June 30, 1937). During 1937 the merchant fleet earned estimated revenue of 7,000,000 crowns (about \$1,867,000).

Government. The Constitution proclaimed Sept. 3, 1937 (see 1937 YEAR BOOK, p. 238), vested extensive powers in a President elected for six years by universal secret suffrage from three candidates proposed respectively by the Chamber of Deputies, the National Council, and representatives of local self-government bodies. If only one candidate is proposed by the three nominating organs, then all three bodies vote as one group on the candidate and if he receives a three-fifths majority he becomes President without the submission of his name to the electorate. The Constitution provided for a bicameral National Assembly comprising a Chamber of 80 Deputies elected by universal suffrage and a National Council of 40 elective, appointive, and ex-officio members. A new National Assembly must be appointed and elected at least every four years. The President appoints a cabinet (government) which must resign or the President must call new elections to the Chamber if a motion of no confidence in the ministry is sustained by a majority vote in the Chamber. The President may call plebiscites on issues of major importance. For the application of this Constitution in 1938, see *History*.

History. With the entrance into force on Jan. 1, 1938, of Estonia's new Constitution, the country took a partial step toward restoration of democratic government. But events of the year demonstrated that the dictatorial regime established by President Constantin Päts in 1934 retained quasi-dictatorial powers. The first general election under the new fundamental law was held Feb. 24, 1938, at which the 80 members of the Chamber of Deputies were chosen. The National Front supported by acting President Päts' government captured 63 seats as against 17 obtained by the Liberals and Laborites of the opposition. The National Council, subsequently appointed, and the assembly of local governmental representatives were likewise controlled by the Acting President, with the result that he was elected President under the new Constitution on April 24 by 219 votes against 19 without submitting his candidacy to the voters at large (see *Government* for the constitutional provision covering this procedure).

The newly selected National Assembly convened for the first time on April 21. Following the election of Päts as President, he was reappointed as Premier Karl Einbund (Kaarel Eenpalu). Päts, Einbund, and Gen. Johan Laidoner, commander-in-chief of Estonia's armed forces, had constituted the governing triumvirate since their 1934 coup forestalled the establishment of a frankly Fascist regime. The

"state of emergency" under which the Päts regime had governed was not restored with the enactment of the new Constitution but was extended on September 13 (during the European crisis over Czecho-Slovakia) for another 12 months. However, some 1200 prisoners, including 73 Fascists and 106 Communists charged with political offenses, were granted amnesty in celebration of Päts' election as President.

The government invoked the critical European situation as necessitating further delay in granting the civil liberties and minority rights guaranteed in the new Constitution. The ban on political parties was continued and censorship of the press was tightened. The small group of Liberals and Laborites in the Chamber of Deputies protested vigorously against this policy, asserting that the government had broken its promise to restore democratic rights.

Developments during the year emphasized the threat to Estonia's independence from both the Soviet Union and Germany. The Soviet Government protested on January 24 against the slaying of two Russian soldiers in a clash with Estonian border guards a few days earlier. It was Estonia's turn to protest on February 10 when Russian guards killed four Estonian soldiers, apparently in retaliation for the preceding incident. Estonia again protested at alleged repeated violations of her territorial waters by Russian warships and submarines during the large-scale Soviet naval maneuvers in the Gulf of Finland in July.

Meanwhile, the German-speaking minority in Estonia had fallen increasingly under the sway of Nazi propaganda. During the Czecho-Slovak crisis in September the German-speaking Estonian Youth organization donned costumes similar to those worn by the Sudeten Germans. The Hitler salute also came into general use and when Estonian newspapers criticized it as inconsistent with Estonian customs, the German Minister was reported to have informed the Estonian Foreign Minister that the German-speaking Estonians were "Reich Germans" and as such were obliged to give the salute.

In a speech before the National Assembly on October 15, the Foreign Minister announced that Estonia had no obligations to assist any country except Latvia in case of aggression by a third power. The ties binding Estonia and Latvia with Lithuania in the Baltic Entente proved largely ineffective when Poland delivered her ultimatum to Lithuania in March (see LITHUANIA and POLAND under *History*). Foreign Minister Beck of Poland spent several days in Tallinn in June seeking to win Estonian support for his efforts to create a neutral bloc between Germany and the Soviet Union. While seeking to reinforce its independence by every possible recourse of diplomacy, Estonia continued to place major reliance upon strengthening its armed forces and frontier fortifications.

See BALTIC ENTENTE; LATVIA under *History*.

ETHIOPIA. A former native empire in East Africa, formally annexed by Italy on May 9, 1936, following its conquest by force of arms (see 1935 and 1936 YEAR BOOKS under ETHIOPIA). Area, about 347,500 square miles; population, roughly estimated at over 4,000,000. By the decree law of June 1, 1936, Ethiopia was incorporated with Eritrea and Italian Somaliland in the new colony of Italian East Africa. For statistics and developments in 1938, see ITALIAN EAST AFRICA.

ETHNOLOGY. See ANTHROPOLOGY.

EUGENICS SOCIETY, AMERICAN. A society incorporated in 1926 as successor to Eugenics Committee of the U.S.A., and Eugenics Society of the U.S.A. The major purpose of the American Eugenics Society is to develop to their utmost all those influences which may help to bring about a more eugenic distribution of births so that those parents, regardless of economic, racial, or regional grouping, who best provide the essentials necessary for the development of character and intelligence, being also those who on the whole pass on to their children a biological inheritance superior to the average of the nation, will have the major portion of the country's children. To this end the Society co-operates with agencies devoted to education, recreation, public health, religion, social service, and social readjustment in order to discover and promote measures by which each can make it easier for responsible parents in every class of society to have families of reasonable size without undue financial and social sacrifice.

The membership and regular mailing list of the Society in 1938 was 1500, including individuals and organizations. In 1938 the Society published a pamphlet entitled "Practical Eugenics—Aims and Methods of the American Eugenics Society," which is a new conception of eugenics, relating eugenics to other social needs. In the spring of 1939 the Society will begin its publication of an American eugenics quarterly.

The budget for 1938-39 is \$7000. Samuel J. Holmes, President; Shepard Krech, Vice-President; Frederick Osborn, Treasurer. The office address is 50 West 50th Street, New York City, Rudolf C. Bertheau, Secretary.

EVANGELICAL AND REFORMED CHURCH, THE. A denomination formed by the merger in Cleveland, Ohio, on June 26, 1934, of the Evangelical Synod of North America and the Reformed Church in the United States. The former was founded at Gravois Settlement, Mo., in 1840, by representatives of the Evangelical Churches of Germany and Switzerland. The latter traced its origin chiefly to the German, Swiss, and French Protestants, who settled in America early in the 18th century. Both churches, in doctrine and polity, were akin to the Reformed bodies.

The highest judicatory of the Evangelical and Reformed Church is the General Synod, which meets biennially. A new Constitution was declared adopted at the General Synod which met at Columbus, Ohio, in June, 1938, and it will go into effect at the next meeting of the General Synod, to be held at Lancaster, Pa., in 1940. The officers of the General Synod of the Evangelical and Reformed Church are: President, Rev. Dr. L. W. Goebel; First Vice-President, Rev. Dr. George W. Richards; Second Vice-President, Hon. D. J. Snyder; Secretary, Rev. Dr. William E. Lampe; Treasurer, Mr. F. A. Keck.

In its combined statistics for the year 1937, the Evangelical and Reformed Church reports a membership of 652,670 in 2916 congregations. A gain in membership of 7317 was made during the calendar year 1937. Total expenditures for congregational purposes amounted to \$7,796,394, and total benevolences to \$1,522,745. The Sunday School enrollment is 515,399.

The denomination supports foreign work in six fields: Japan, China, India, Iraq, Honduras, and Africa, the last-named work having been assumed following the favorable action of the General Synod in June, 1938. In the home field it supports more than 300 home mission churches and six

special projects, among foreign-language groups, underprivileged, Japanese in California, and the Indians in Wisconsin. It lists 12 educational institutions as follows: Catawba College, Salisbury, N. C., Cedar Crest College, Allentown, Pa., Elmhurst College, Elmhurst, Ill., Franklin and Marshall College, Lancaster, Pa., Heidelberg College, Tiffin, Ohio, Hood College, Frederick, Md., Ursinus College, Collegeville, Pa., Massanutten Academy, Woodstock, Va., Mercersburg Academy, Mercersburg, Pa., Eden Theological Seminary, Webster Groves, Mo., the Theological Seminary at Lancaster, Pa., and The Mission House, Plymouth, Wisconsin, which has an academy, a college, and a theological seminary. The various sections of the Church support 9 hospitals, 10 orphanages, 11 old folks' homes, and 2 homes for epileptics.

The official publications of the denomination are: *The Messenger*, of the Evangelical and Reformed Church, a weekly, and the *Year Book and Almanac*. The German constituency is served by *Der Friedensbote* and the *Kirchenzeitung*, both weeklies. The Board of Christian Education lists, among its many publications, *The Builder*, a monthly magazine for Sunday School teachers, and *Youth, Venture, Treasure, and Friends*, which are weekly Sunday School papers. *The Outlook of Missions* is a monthly magazine devoted to the home and foreign mission work of the Church.

Joint headquarters of the denomination are in the Schaff Building, 1505 Race St., Philadelphia, Pa., and Evangelical Synod Building, 1720 Chouteau Ave., St. Louis, Mo.

EVANGELICAL CHURCH. A denomination formed by the reunion in 1922 of the Evangelical Association and the United Evangelical Church. (For historical details, see the *NEW INTERNATIONAL ENCYCLOPEDIA*, vol. viii, p. 202, and vol. xxii, p. 661.) In 1938 it had 24 conferences in the United States and Canada, 1 in Japan, 3 in Germany, 1 in Switzerland, and 1 in China, its membership throughout the world totaling 276,000. The China conference was organized on Feb. 17, 1937, with a membership of 2175. In the United States and Canada there were 239,170 members, enrolled in 2016 churches. Of the 2501 churches throughout the world, 2065 were served by itinerant preachers and 436 by local preachers. The 1998 Sunday Schools had an enrollment of 291,995; 655 Young People's Missionary Circles had 15,462 members; 809 Mission Bands had 21,387 members; and 1917 Evangelical Leagues of Christian Endeavor had 42,486 members. Working under the general direction of the board of missions were 1216 women's missionary societies, with a membership of 34,951. The total value of all church property in the United States and Canada was \$33,647,896, while the amount of money raised during the year was \$5,013,669.

The chief schools of the denomination are: North Central College and the Evangelical Theological Seminary at Naperville, Ill.; Western Union College at Le Mars, Ia.; Albright College and the Evangelical School of Theology at Reading, Pa. It also maintains two orphanages and five old people's homes in the United States, as well as several hospitals. Official periodicals are the *Evangelical-Messenger*, *Der Christliche Botschafter*, *The Evangelical Crusader*, and *The Evangelical Missionary World*. A quadrennial general conference was held at Johnstown, Pa., Oct. 6-14, 1938. All questions of law in the interval between general conference sessions are decided by the board of bishops, which in 1938 consisted of Bish-

ops J. S. Stamm, G. E. Epp, E. W. Praetorius, and C. H. Stauffacher. Headquarters are at the Evangelical Press, 1900 Superior Ave., Cleveland, O., and in Harrisburg, Pa.

Africa. Several American expeditions were in Africa during the year, most of them engaged in collecting for museums. A route untraversed since Stanley blazed it in 1879 on his journey to rescue Livingston was followed by an expedition to the Teita district of Kenya Colony, sponsored by Harry Snyder for the American Museum of Natural History. W. D. Campbell collected habitat groups for the same museum in the Sahara Desert, Nile River valley, French Cameroons, French Guinea, and Northern Rhodesia. Mammal collections for the same museum were made in the Upper Zambesi region by the Vernay-Kaffarian expedition.

Asia. Mountaineering expeditions were again active in the Himalayas and adjacent ranges. A fifth assault was made on Mount Everest by a British expedition under H. W. Tilman, but it was balked by the unusually early onset of the monsoon after reaching a height of about 27,300 feet, within 2000 feet of the summit (29,002 ft.). Despite the disaster suffered by the German Nanga Parbat expedition of 1937 (see 1937 **YEAR BOOK**, p. 240) a German party under Paul Bauer made another attempt upon the mountain in 1938. The illness of the porters and extremely bad weather forced the abandonment of the advance after a height of about 23,800 feet was reached. The bodies of Willi Merkl, leader of the ill-fated 1934 German Nanga Parbat Expedition, and two of his porters were found well preserved in the cold, dry air.

A party of American mountain climbers led by C. S. Houston made the third known attempt to scale Mount Godwin Austen, a 28,280-foot peak in the Karakoram range, ranked as the world's second highest mountain. Two of the climbers advanced to the 26,000-foot level, as compared with the 22,000 feet reached by the Duke of the Abruzzi in 1909, and reported that the ascent from this point to the peak appeared to present no insurmountable difficulties. Their feat of exploring the various routes up this inaccessible and little-known peak and the ascent to within striking distance of the top was considered the outstanding development of the year in the mountaineering world. A party of British climbers led by Lieut. J. Waller and including Prof. T. Graham Brown of the University of Wales, who led the successful assault on Nanda Devi in 1935, attacked Mount Masherbrum (25,660 ft.) in the Karakoram range, but was turned back by exposure and bad weather after ascending to about the 25,000-foot level. A German expedition began a two-year exploration of the eastern Himalayas and Tibet.

Archaeological sites in the Hadramaut along the southern section of the ancient Frankincense Road through Arabia were explored by Miss Freya

Stark and two other Englishwomen. For centuries in pre-Islamic times this road was the chief traffic artery between India and the Mediterranean. Miss Stark identified Bir Ali, a village on the coast some 140 miles northeast of Aden as the ancient harbor of Cana from whence the Frankincense Road led across the Arabian Peninsula.

Australia and Oceania. It was announced before the Legislative Assembly of South Australia about mid-year that a stockman in the interior of South Australia had reported the discovery of eight human skeletons. A government expedition was dispatched to the region to find out if the skeletons were the remains of an expedition led by the German explorer, Friedrich Wilhelm Ludwig Leichhardt, which disappeared while attempting to cross the Simpson Desert in the interior of the continent in 1848. When the government party arrived at the scene, they were unable to find the skeletons due to the rapidly shifting sands. Another expedition was sent by the McCoy Society to explore Banks Islands in Spencer's Gulf, South Australia. Donald F. Thomas, Australian government anthropologist, reported during 1938 on his life and explorations among the aborigines of Arnhem Land in the Northern Territory of Australia during 1935-37. He traveled on foot across Arnhem Land from Crocodile Islands to Blue Mud Bay. He reported that depopulation of the aboriginal population of this wilderness was proceeding at a faster rate than was previously supposed and that less than 3500 natives now remained in Arnhem Land.

The exploration of the eastern interior of the island of New Guinea was continued by the Australian authorities of Papua and the Territory of New Guinea (q.v.). During 1938 a patrol of three Australian officers, 20 native constables, and 100 porters traveled from Mount Hagen to the border of Dutch New Guinea and then penetrated the mandated Territory of New Guinea from Papua by way of the Sepik River. The main objective of the expedition was to study a possible route into the interior by one of the southern tributaries of the Sepik. Meanwhile, exploration of the adjacent interior of Dutch New Guinea was being carried on by a large and well-equipped expedition of the American Museum of Natural History under Richard Archbold. The party established its base camp at Hollandia on the north coast of the island and by means of its seaplane established its advance camp in July at Lake Habbema, a large body of water in the heart of the mountainous interior lying near the source of the Idenburg River at an altitude of 11,000 feet. Another camp was established on the Idenburg River about 125 miles southwest of Hollandia. Large parties of scientists were carrying on explorations and studies of the aborigines and of animal and vegetable life at both camps at the year end. The Lake Habbema camp reported the capture of a number of giant rats measuring three feet from the nose to the tip of the tail. Tree-climbing kangaroos frequented the base camp at Hollandia.

North America. Explorations by an expedition from the Field Museum of Natural History in the Cahone Canyon in southwestern Colorado revealed the largest Indian ceremonial temple ever found on the continent. The kiva, excavated near the rim of the canyon, bore evidences of having been swept by fire an estimated 1200 years ago. Exploration of the St. Elias range in Alaska was continued by the National Geographic-Harvard University Expedition under Bradford Washburn. In August mem-

bers of the party made an airplane flight along the backbone of the range which revealed the largest glacier system in the world outside the polar ice caps. The flight demonstrated that a huge river of ice connected and formed the source of the Bering, Seward, and Malaspina Glaciers. They found a vast expanse of unbroken ice several thousand feet thick and extending from the vicinity of Cape St. Elias eastward and southward for some 235 miles.

Exploring old fur-trade routes for the American Museum of Natural History, Mrs. Mary L. Jobe Akeley followed the trail blazed by David Thompson in making the first crossing of the northern Canadian Rockies. During the year the Royal Ontario Museum at Toronto, Canada, received a sword, battle axe, and other Norse relics reported to have been found in northern Ontario. If authenticated, they would indicate that the Norsemen reached the interior of Canada as early as the 10th century.

South America. The interior of British Guiana and Venezuela again continued to attract the attention of explorers and scientists. Air flights along the Kaieteur escarpment of British Guiana during the year revealed several new falls of unusual dimensions. In May Dr. Paul Arthur Zahl of the Haskins Laboratory, Union College, and Art Williams, American aviator operating in Guiana, discovered on a tributary of the Karanang River 80 miles northeast of Mount Roraima a fall which they estimated at no less than 3000 feet. This find was made during an aerial expedition into southern British Guiana and Brazil on which Dr. Zahl made an extensive collection of large ants and other insects. Dr. Zahl left the United States in November on another expedition to the Mount Roraima region of British Guiana.

Another American aviator, James Angell, reported the discovery from the air of a waterfall with a drop of more than 5000 feet in a tributary of the Caroni River in Venezuela, a branch of the Orinoco. A third fall discovered during the year in the Misiones territory of northeastern Argentina was not so high but had unusual features. A tributary of the Acaragua River plunged downward 200 feet, disappeared underground for 200 yards, and upon emerging formed another 80-foot cascade.

The results of the exploration and scientific study of the Auyantepui tableland in the British Guiana highlands by an American Geographical Society expedition were described by G. H. H. Tate, of the American Museum of Natural History, in the July, 1938, issue of the *Geographical Review*. It was calculated that the plants and animals of the tableland had been isolated from the surrounding region for perhaps a million years; they showed distinct coloration and other variations from the flora and fauna of the surrounding lowland territory. The Roraima Plateau was visited during the year by another scientific group, consisting of A. Pinkus of Michigan State Museum, P. S. Peberdy of the British Guiana Museum, and T. Pain of England. Emmet R. Blake, assistant curator of birds of the Field Museum in Chicago, had a narrow escape from drowning when his boat upset in the rapids of the Corentyne River of British Guiana. He lost all of his equipment and about half of the 2400 bird, animal, and reptile specimens that his expedition of 17 members had collected. Richard C. Gill returned late in December from another expedition to the interior of Ecuador in search of rare drugs used by the Indians. Dr. H. B. Wright of Philadel-

phia made similar collections among the Jivaro Indians of Ecuador.

Theodore J. Waldeck, who led an expedition in search of Paul Redfern, American aviator lost in an airplane flight in 1927, announced that he had found definite proof that Redfern had been killed when his plane crashed near the Caroni River in Venezuela. The Terry-Holden expedition returned to the United States in April after six months in the jungles of British Guiana and Brazil collecting for the American Museum of Natural History.

See GEOLOGY for undersea exploration.

FALKLAND ISLANDS. A British crown colony in the South Atlantic, comprising East Falkland, West Falkland, and adjacent islands. Total area, 4618 square miles; population (Jan. 1, 1938), 2391. Stanley (capital), had 1200 inhabitants in 1936. Sheep farming is the main occupation of the people. In 1937 imports were valued at £116,752 (provisions, £23,039; hardware, £21,133; timber, £6452); exports, £204,020 (wool, £162,511; hides and skins, £17,923; livestock, £13,773; seal oil, £4200; tallow, £2618); total revenue, £85,599; total expenditure, £81,289; public debt, nil. The government is headed by a governor, advised by an executive council of 5 official and 2 unofficial members. There is a legislative council of 4 official and 4 nominated unofficial members. Governor and Commander-in-Chief, Sir Herbert H. Heaton (appointed Jan. 3, 1935).

Dependencies. The dependencies of the Falkland Islands include South Georgia (1450 sq. mi., statute; population, approximately 700 in the summer and 233 in the winter), South Shetlands, South Orkneys, South Sandwich Islands, and Graham Land. Whaling (October 16 to April 16) and sealing (March 1 to October 31) are the main occupations. In 1937 total imports (including importations for re-exportation) £371,223; total exports (including re-exports of £182,764), £406,640 (whale oil, £305,049; guano, £34,328; seal oil, £32,496; whale meat meal, £26,044); revenue, £12,942; expenditure, £12,492; public debt, nil. The dependencies are subject to the authority of the governor and to the executive and the legislative councils of the Falkland Islands. During February of 1938 it was announced that the body of water separating Graham Land from Alexander I Land had been named George VI Sound.

FAROE (fär'ö or fä'rö) **ISLANDS.** A group of 21 islands between Iceland and Scotland, forming a county of Denmark. Bordö, Kalsö, Osterö, Sandö, Strömö, Süderö, Vaagö, and Viderö are the chief islands. Total area, 540 square miles;

population (1935), 25,744. Thorshavn (capital), on the island of Strömö, had 3200 inhabitants. Fish, whale oil, woollen goods, lamb skins, and feathers are the principal exports. Administration is under a prefect named by the King of Denmark. The local parliament of 21 members elects a representative to the Danish Landsting (upper house); the people elect by vote a representative to the Danish Folketing (lower house).

FASCISM. The year 1938 was one of phenomenal gains for fascism of both the Italian and German varieties at the expense of both communism and democracy. The partition of democratic Czecho-Slovakia (q.v.) by the Munich accord of September 29-30 was a world-shaking victory for Fascist ideology and methods. It gave the Fascist powers, grouped about the Rome-Berlin axis, a dominant position in Europe, discredited the great European democracies, and greatly weakened both the strategic and diplomatic position of the Soviet Union. It proved a vast stimulus to Nazi movements in the other countries of Central and Southern Europe, and forced a Fascist regime upon Czecho-Slovakia. The growing danger of German-supported Nazi revolts in Hungary, Rumania, and Bulgaria forced the governments of those countries rapidly toward fascism in self-preservation.

The Metaxas dictatorship in Greece and the quasi-dictatorial regimes in Poland, Lithuania, and Yugoslavia were all strengthened as against democratic opposition movements by the events at Munich. The Fascist sweep was aided also by the incorporation of Austria in Germany, the steady progress of Gen. Francisco Franco—with German and Italian aid—in the Spanish civil war, the victories of Japanese armies in China, and the rapid transformation of Japan into a military-fascist state. After Munich, the Fascist bloc of Europe by threats of economic and military reprisals brought pressure upon the small democracies of Western and Northern Europe and even upon Britain and France to suppress Communist and other anti-Fascist activities and manifestations. The net result of these threats was to strengthen the faith of the remaining democracies in their existing governmental systems and to further discourage indigenous Fascist movements. On the other hand, the influx of Jewish refugees from Germany, Italy, and Czecho-Slovakia into other countries in Europe and overseas lent fuel to anti-Semitic and Fascist agitation throughout the world.

Fascism in the United States. There were three main sources of Fascist propaganda in the United States during the year—pro-Nazi German-American organizations, pro-Fascist Italian groups, and the various native Fascist organizations. Considerable light was shed on the activities of German-American and Italian-American propagandist organizations at hearings conducted during the latter half of the year by the special House Committee on Un-American Activities, headed by Representative Martin Dies of Texas.

The German-American Bund. On August 12 John C. Metcalfe, a native of Germany, a former member of the pro-Nazi German-American Bund, and an investigator for the Dies Committee, testified as did several other German-Americans. Their statements were summarized by the *New York Times* as follows:

Testimony was given that there were in the United States today probably 500,000 persons, men and women, who were members of pro-Nazi organizations or sympathetic with them. A Nazi movement was under way in this country, the real aims and purposes of which were the establishment of a smooth-working, efficient spy system, the

creation of a sabotage machine to operate in an emergency, and the bringing into the Nazi fold of as many German-Americans as possible.

The German-American Bund, of which Fritz Kuhn is the "Fuehrer," was named as the backbone of the Hitler movement. Soon after the present investigation was ordered by the House, Kuhn dispatched letters to all Bund leaders and agents in the United States ordering them "to destroy at once" all evidence in the form of correspondence or otherwise which was un-American in nature or which might directly or indirectly link the Bund in America with the Bund in Germany.

Metcalfe charged that Kuhn had a secret relationship with the Nazi Government in promoting the German-American Bund's activities. He declared the Auslands Bureau of the Nazi Government in Stuttgart, Germany, staffed largely by former German leaders of Nazi activities in the United States, was "actively engaged in directing, planning, and helping to finance under various names the activities and the programs of the German-American Bund in the United States."

During subsequent hearings Metcalfe testified that the Bund had a force of about 5000 Storm Troopers; that German consular officials in the United States helped to finance its radio broadcasts and other propaganda activities; and that Kuhn and other Bund leaders had claimed responsibility for the replacement of Dr. Hans Luther, German Ambassador to Washington, and various consular officials with Germans more sympathetic to their views. This testimony led the German Ambassador at Washington, Dr. Hans Heinrich Dieckhoff, formally to deny on September 30 that there was any "secret relationship" between the German Government and the German-American Bund. "The German Government," he said, "has always taken the point of view that the *Amerika-Deutscher Volksbund* is to be considered as a purely American affair. . . . For a long time all German nationals have been strictly prohibited to be or to become members of the Bund, in view of the fact that it is their duty to refrain from any interference in internal American affairs."

It was also charged before the committee that the German-American Bund was seeking to organize all Fascist groups in the United States into one movement under the Bund's leadership, and that the German secret police in 1937 had established a special section for espionage and Nazi propaganda in the United States. As a result of these investigations, Chairman Dies expressed the conviction that 90 per cent of the German-Americans "definitely opposed" the Bund, but that many German war veterans were active in training the Bund's Storm Troops.

The Bund's Program. Meanwhile the Bund's program had been stated in part by Kuhn at Camp Nordland near Andover, N. J., on September 4, following his re-election as national leader. He declared that the Bund stood for the Constitution, the flag, and the lofty ideals of the United States but that it demanded "a socially just, white, gentile-ruled United States and gentile-controlled American labor unions free of Jewish-Moscow-directed domination"; the exclusion of Jews from "positions of importance" in government, national defense forces, and educational institutions; and a "thorough cleaning of our most important medium of propaganda and entertainment, the Hollywood film industry."

He also called for severance of diplomatic relations with the Soviet Union, the outlawing of the Communist party in the United States, prosecution of all known Communists "for high treason," termination of all foreign entanglements, severance of

all connections with the League of Nations, immediate cessation of "all dumping of undesirable aliens disguised as political refugees on the shores of this country," and prohibition of "abuse of the freedom of the pulpit, press, radio, and stage, undermining the patriotism and the morals of the American people." Two days later the Bund's national convention in New York City voted to petition for an amendment to the United States Constitution barring Jews from election or appointment to public offices and the courts.

While assuming the role of an "American" political group, the Bund thus supported all of the policies of the Hitler regime in Germany. Its activities were described by Paul B. Taylor in *Foreign Policy Reports* (July 15, 1938) as follows:

The Bund . . . seems to have affiliations with a large number of "patriotic" and especially anti-Semitic American organizations. Its weekly paper, the *Deutscher Weckruf und Beobachter*, appears in New York, Philadelphia, Chicago, and San Francisco, and consists largely of diatribes against Jews and defenses of German policy. It seeks to instill National Socialist principles in German-American youth, and its business subsidiaries foster buying from German stores. It now has 22 camps, at some of which visitors have reported that military drill takes place and that a "Nazi" atmosphere prevails. Until May, 1937, at least, the Bund allegedly required an oath to Hitler from its members.

Split in German-American Ranks. The activities of the German-American Bund and developments in Germany during 1938 produced a split in the ranks of the German-American organizations on the Nazi issue. The German-American Conference, including 13 of the leading German-American organizations in New York City, refused to invite the Bund to join in the annual German Day celebration in Madison Square Garden on October 2. This led the German Ambassador at Washington, the Consul General in New York, the German-American Commercial League, and a large number of Bund sympathizers to withhold their support of the celebration. Theodore H. Hoffmann, national president of the Steuben Society, told the Madison Square Garden meeting that it marked "a turning point in the history of German-American movements in this country." Thereafter the Steuben Society leaders and other anti-Bund German-Americans waged open warfare upon the Bund while expressing approval of many Hitler policies in Germany. In an apparent attempt to heal the rift among German-Americans, a new movement known as the German-American Front was launched by the New Jersey section of the Bund on October 11.

Growth of Anti-Nazi Sentiment. The activities of the German-American Bund, carrying a threat to American national unity if its propaganda made headway among Americans of German origin, served to strengthen the antagonism manifested by American public opinion toward Nazi ideology and the domestic and foreign policies of the Reich (see *GERMANY under History*). This antagonism was displayed by the numerous anti-Nazi demonstrations and riots accompanying Bund meetings throughout the country and by legal efforts to restrict Bund activities.

On July 12 a Suffolk Co., N. Y., jury found the German-American Settlement League, Inc., operator of a Nazi camp at Yaphank, L. I., and the league's six incorporators guilty of violating the New York State Civil Rights Law requiring oath-bound organizations to file lists of their members, officers, and regulations with the Secretary of State. County Judge L. Barron Hill fined the league \$10,000 and the six other defendants \$500 each. How-

ever, the Appellate Court in Brooklyn on November 4 unanimously reversed the convictions, dismissed the indictment, and remitted the fines. It held that there was insufficient evidence on which to base an indictment and lack of proper jurisdiction inasmuch as the league required a pledge rather than an oath as a condition of membership.

To restrict Nazi, Fascist, and Communist propaganda, Congress passed the Propaganda Agency Act (approved June 8, 1938), requiring persons engaged in propaganda in behalf of any foreign government to register with the Secretary of State. The Bund refused to register, holding that it was a purely American organization. On November 27 Representative Dies urged the Department of Justice or some other agency to prosecute the Bund and other Fascist and Communist groups for "failure to comply with this act of Congress." Among the American Fascist groups which he suggested be investigated under the Propaganda Agency Act were the Khaki Shirts, organized in 1933 by Art J. Smith; the Silver Shirts, with headquarters at Asheville, N. C.; the Italian Fascists, the American Fascists, the American Aryan Folk Association of Portland, Ore.; American Guard, the American League of the Friends of the New Germany, Portland, Ore.; and the American National Socialist party.

Italian Fascist Propaganda. The Dies Committee also collected evidence concerning Fascist activities and propaganda among Italo-Americans. On October 4 Girolamo Valenti of New York, chairman of the Italian Anti-Fascist Committee, told the committee that a strong Fascist movement had been built up among Italo-Americans by the Italian Government acting through consular officials and other agents in the United States. He charged that Fascist propaganda was disseminated in public and parochial schools by means of lessons in the Italian language, that hundreds of Italo-American children were sent to Italy annually for Fascist indoctrination, and that nearly all Italian-American newspapers and periodicals were under the control of Fascist agents. He declared many Italian-Americans had been organized into "black shirt legions" on a military basis, that large sums were raised among Americans of Italian origin, often by intimidation, to aid the Italian Government, particularly during the war with Ethiopia; and that an Italian consular officer had threatened American citizens of Italian descent who raised funds for the Spanish Loyalists.

Homer Martin, president of the United Automobile Workers Union, testified before the committee on December 1 that Judge Paul V. Gadola of Flint, Mich., had connections with the Fascist movement. He charged that in 1934, Giacomo Ungarelli, Italian vice-consul in Detroit, had attempted to force the local Italian community to support the Italian Government and had threatened to cut off the sources of supply of importers of Italian products if they refused such support. He said the vice-consul was recalled after protests were made to the State Department.

On October 12, 35,000 Italian-Americans attending a Columbus Day ceremony in New York City booed Mayor LaGuardia, who was well known for his anti-Fascist sympathies. The *New York Times* reported that the meeting "was definitely sympathetic toward the Fascist regime in Italy." The anti-Semitic decrees of the Italian Government aroused controversies in the ranks of the American Sons of Italy and other Italian-American or-

ganizations, with some leading members denouncing and others supporting the decrees.

Symptoms of American Fascism. The growth of anti-Semitism and efforts to withhold constitutional rights from radical political and labor movements were pointed to during the year as evidence of incipient American fascism. The most notable example of this tendency was provided by the city administration of Jersey City, N. J., under Mayor Frank Hague, Democratic boss of New Jersey (see *NEW JERSEY* under *Political and Other Events*). Hague's police deported Norman Thomas, the Socialist leader, Representative Jerry O'Connell of Montana, and various others who attempted to speak in opposition to the Mayor's anti-labor policies.

Charging infringement of their civil liberties, the Committee for Industrial Organization and the Civil Liberties Union took the case to the Federal Courts. On October 27, Judge William Clark, sitting in Newark, found in favor of the plaintiffs and enjoined Jersey City officials from interfering with the plaintiffs in their right to "move freely" in Jersey City, distribute leaflets and circulars, address public meetings in the parks, "subject only to the city's right to carry out the recreational purpose of those parks," and to display placards. However, Hague continued to refuse permits for speeches by "radicals and Reds."

The candidacy of the Rev. Dr. Gerald B. Winrod, free-lance minister of Wichita, Kan., for the Republican Senatorial nomination also raised the issue of fascism versus democracy. Because of utterances construed as favoring fascism and as intolerant toward Catholics, Jews, Negroes, and the Federal Council of Churches, he was nick-named the "Kansas Nazi," and was vigorously opposed by leading Republican politicians as well as by liberal newspapers, ministers, and public figures. In the primary election, he received a few more than 50,000 votes, and finished a poor third.

Latin America. The countries of Latin America were subjected to a growing flood of Fascist propaganda from Germany, Italy, Insurgent Spain, and Japan. This propaganda took the form of radio broadcasts, free news services, lecture tours by German and Italian professors, and other propaganda agents, economic pressure, and incessant activities of German and Italian diplomatic and consular officials. Army, navy, and aviation officials of various Latin-American countries were invited to study developments in their fields in Germany and Italy at the expense of the latter countries. Scores of students went to the two great Fascist countries for study and indoctrination in Nazi-Fascist ideology, with all expenses paid. German and Italian communities in Latin America were organized by cultural attachés and other agents as centers of Nazi and Fascist propaganda in their adopted countries.

American observers agreed that the Nazi propaganda drive had back-fired, especially in Brazil where such propaganda was rigorously curbed after the failure of the pro-Fascist *Integralista* revolt on May 11 (see *BRAZIL* under *History*). In Argentina, Uruguay, and other Latin-American countries, there was resentment at the steps taken by the German Government to register the vote of their German residents in Hitler's plebiscite on the annexation of Austria. Another abortive Fascist revolt was staged by the Chilean *Nacistas* (Nazis) on September 5, but this had no apparent connection with German Nazi propaganda. The subsequent electoral victory of the Popular Front in

Chile was a set-back to pro-Fascist forces in that republic. Democratic administrations were also installed in Argentina and Uruguay. Fascist influences, however, appeared to gain ground in Peru, where Italian and German influence was strong and the Benavides dictatorship receptive to anti-democratic doctrines. The controversy between Mexico on the one hand and the United States and Great Britain on the other over Mexican appropriations of foreign oil properties afforded an opportunity for Fascist propaganda and inroads upon United States trade with Mexico which Germany was not slow to seize. The struggle between democracy and fascism for control of Latin America was waged behind the scenes at the Pan-American Conference (q.v.) at Lima in December.

FEDERAL CAPITAL TERRITORY, AUSTRALIA. An area of 940 square miles within the State of New South Wales, containing Canberra (8400 inhabitants on Dec. 31, 1937), the capital of Australia. Total population (Mar. 31, 1938, estimate), 10,499. The general control of the territory is under the Australian Minister of the Interior but certain services are still maintained by the Department of Health and the Attorney General's Department. See AUSTRALIA.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.

An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1938 it included most of the major Protestant denominations of the United States, as follows: Northern Baptist Convention; National Baptist Convention; Seventh-Day Baptists; General Council of the Congregational and Christian Churches; Disciples of Christ; Evangelical Church; Evangelical and Reformed Church; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Protestant Episcopal Church; Reformed Church in America; Reformed Episcopal Church; United Brethren in Christ; United Presbyterian Church of North America; United Lutheran Church in America. Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose national council co-operates in certain specified areas of work. Since 1932 the United Church of Canada has been affiliated with the Council.

At the biennial meeting of the Council held in Buffalo, N. Y., Dec. 6-9, 1938, the Syrian Antiochian Orthodox Church in North America was received into membership. This is the first of the Eastern Orthodox group of churches—and the first non-Protestant body—to come into the Council.

The total number of communicant members in-

cluded in the Council's constituency in 1938 was 24,991,281. Co-operating with the Council were such agencies as the Home Missions Council, the Council of Women for Home Missions, the Council of Church Boards of Education, the American Bible Society, the Foreign Missions Conference of North America, and the International Council of Religious Education.

Of the Council's eight departments, the following made a significant contribution during 1938. The department of social service conducted a series of conferences on preparation for marriage and family life; the department of evangelism directed the University Christian Mission in the interest of a spiritual awakening in educational institutions and the department of international justice and good will carried on a special relief appeal in the churches for war sufferers in China and Spain and for German refugees. The radio department sponsored 10 religious programs on the air each week. The department of relations with churches abroad participated in the movement for the creation of a World Council of Churches. The department of research and education issued a report on "Broadcasting and the Public." A commission for the study of Christian unity began its work as a part of the permanent program of the Council. The *Federal Council Bulletin*, a monthly, continued to be issued as the official organ.

Officers during 1938 were: President, the Rev. Edgar DeWitt Jones; vice-president, the Rev. Joseph R. Sizoo; treasurer, Frank H. Mann; and general secretary, the Rev. Samuel McCrea Cavert. National offices are at 297 Fourth Avenue, New York City. An office is also maintained in the Woodward Building, Washington, D. C.

FEDERATED MALAY STATES. The four States of the Malay Archipelago, shown in the accompanying table.

State	Sq. mi.	Pop. (1937)	Capital
Negri Sembilan ..	2,580	264,742	Seremban
Pahang	13,820	199,487	Pekan
Perak	7,980	879,632	Taiping
Selangor	3,160	617,536	Kuala Lumpur
Fed. Malay States	27,540	1,961,397	Kuala Lumpur

Chief towns (with 1937 populations): Kuala Lumpur, the capital (136,068), Ipoh (64,343), Taiping (38,083), Seremban (27,363), and Klang (27,030). During 1937 there were 74,196 births (37.8 per 1000) and 39,031 deaths (19.9 per 1000). The 1477 schools (English, Malay, Chinese, and Tamil) had 125,615 students enrolled (1937); in addition, there were technical and trade schools maintained by the government.

Production and Trade. Agriculture and mining form the main industries of the country. The chief products (with 1937 export figures in parentheses, in tons) were rubber (247,386), tin and tin ore (75.5 per cent basis: 75,394), copra (88,915), firewood, timber, and planks (46,825), rice and paddy (6593), pineapples, canned (15,329), palm oil (29,600), palm kernels (4867), tapioca (8166). Gold produced in 1937 totaled 33,828 oz. Livestock (1937 census): 61,859 oxen, 57,502 buffaloes, 10,-

189 sheep, 122,738 goats, 328,167 swine, and 251 horses. In 1937 imports were valued at \$8131,101,-350 (the chief items were rice, petroleum, piece goods, and cigarettes); exports, including re-exports, \$8357,247,152 (rubber, \$8171,258,400; tin and tin ore, \$8151,418,742; copra, \$89,530,347). The Straits dollar (S\$) averaged \$0.5797 for 1937.

Communications. The road system, in 1937, comprised a total of 4558 miles of which 2939 miles were paved and graveled. The government controls all of the railways (1068 route miles of meter-gauge track) south of the Siam border. In 1937, 1479 ships aggregating 3,615,833 tons cleared Port Swettenham.

Government. For 1937 revenue totaled S\$80,-864,589; expenditure, S\$71,143,471; public debt, S\$65,285,715, against which the sinking funds amounted to S\$2,719,838. The States, which are under the protection of Great Britain, are governed in matters common to them all by a Federal council comprising the Governor of the Straits Settlements (who is ex officio high commissioner) as president, 15 government officials, and 12 unofficial members nominated by the high commissioner. Each of the four States has a native ruler who is subject to the advice of a British Resident. State councils may legislate in purely local matters. High Commissioner, the Governor of the Straits Settlements—Sir Shenton Thomas (appointed, 1934).

History. The Sultan of Selangor, Sir Ala'idin Suleiman Shah, died in Klang on Mar. 31, 1938, and was succeeded by his third son, the new Sultan, Sir Alam Shah. On Oct. 14, 1938, the Sultan of Perak, Sir Iskandar Shar, died and was succeeded by the new Sultan, Sir Abdul Aziz.

FENCING. See SPORTS.

FERTILIZERS. There was steady advance during 1938 in improving the quality of fertilizers and increasing their efficient use. The fertilizer industry of the United States appears to have had a fairly prosperous year, the estimated sales being 7,371,000 tons as compared with 8,172,000 tons the previous year, which, however, represented the all-time peak for fertilizer sales. It should also be borne in mind that with constant improvement in quality of fertilizers, gross tonnage is not an entirely dependable measure of plant food supplied and used in form of fertilizer.

The steady improvement in grades of fertilizers and in methods of application is beginning to have far-reaching effects on efficiency and economy of use. The plant food content of fertilizer increased from 1880 to 1936 as follows: Nitrogen from 2.3 to 3.8 per cent; phosphoric acid (P_2O_5), 8.9 to 9.3 per cent; potash (K_2O), 2.2 to 5.5 per cent; total, 13.4 to 18.5 per cent.

A committee representing the U.S. Department of Agriculture, many of the State experiment stations, and the National Fertilizer Association on the basis of an exhaustive study of fertilizer placement has formulated explicit directions for most effective placement of fertilizers for various soils and crops, and these are becoming widely known and used with great advantage. It appears from the investigations of the committee that the best method of application for nearly all row crops is in bands an inch or two away from the seed and at its level or just below. This method of placement practically insures against injury to seed or roots and tends to lessen the fixation which occurs when fertilizers are intimately mixed throughout the soil. Farm machinery manufacturers now supply efficient machines for applying fertilizers in this way.

The superiority of localized application is now generally recognized, especially with concentrated fertilizers and heavy applications. For example, the North Carolina Agricultural Experiment Station (Bulletin 318) found that "side placement of fertilizer at 400, 800, and 1200 lbs. per acre of 4-8-4 mixture and at equivalent rates of 8-16-8 fertilizer on the average gave more rapid germination and a higher yield than did under-seed placements. The yield differences between fertilizer placements were much more pronounced at the higher fertilizer rates than at the low rate." Similar results have been obtained with vegetables at the Virginia Truck Station.

It is known that certain fertilizers leave acid residues in the soil which must be neutralized by lime or other alkaline agents if the highest productivity of the soil is to be maintained. The Vermont Agricultural Experiment Station has estimated that it would require an application to Vermont soils of 883 tons of limestone to neutralize the acidity developed by the 10,252 tons of complete fertilizer which were sold in that State in 1936. Dolomitic limestone has been found to be especially effective for neutralizing the residual acidity of fertilizers, and its use for this purpose is increasing.

The U.S. Department of Agriculture reports that the equivalent acidity of mixed fertilizers increased from 115 lb. of CaCO_3 per ton in 1929 to 152 lb. in 1933 and then decreased rapidly to 19 lb. per ton in 1936. The recent drop in acidity is attributed to the increased use of dolomite and of relatively less acid-forming materials in commercial fertilizers.

Efforts to find simple methods of determining the fertilizer needs of plants and soil deficiencies continued during the year with some especially noteworthy results. For example, the New Jersey Agricultural Experiment Station (Bulletin 626) published, with striking illustrations, the results of its studies of the ocular evidence of soil deficiencies in apple culture which furnishes a simple guide to fertilizer use with that fruit.

The U.S. Department of Agriculture published a review of investigations relating to plant symptoms of fertilizer deficiencies covering both major nutrients such as lime, magnesium, phosphoric acid, and potash, and such minor soil constituents as boron, copper, iron, manganese, sulphur, and zinc.

Phosphates. Much interest was aroused during the year in the conservation and more efficient use of the phosphorus resources of the United States by President Roosevelt's declaration that it is "high time for the Nation to adopt a national policy for the production and conservation of phosphate for the benefit of this and coming generations," and by his recommendation to Congress that a comprehensive study be made of the supply, domestic consumption, and exports of phosphate. In view of the almost universal need of phosphate fertilizer, the conservation and proper use of phosphate resources is a matter of prime importance.

The world's known supply of phosphates is estimated to be 17,200,000,000 tons, of which 7,200,000,000 is in the United States. Of the present phosphate situation, Charles J. Brand of the National Fertilizer Association says:

The United States, with 15 per cent of the productive agricultural land of the world, has 40 per cent of the known high-grade deposits of phosphate rock.

Mining of rock in the past 10 years has averaged about 3,000,000 tons a year—2,000,000 tons representing domestic consumption and 1,000,000 tons representing exports.

At the present rate of use the high-grade deposits of rock in our eastern field will last 200 years and those in the western field 2000 years more.

International trade in phosphate, the principal fertilizer item in such trade, increased to 13,500,000 short tons in 1937, an all-time high, with 92 per cent under control of France, the United States, Russia, and Great Britain. The almost universal need of soils for phosphatic fertilizers and their indispensability for normal plant growth is constantly, and in some cases rapidly, increasing the use of such fertilizers.

J. W. Wizeman of the Bureau of Foreign and Domestic Commerce, U.S. Department of Commerce, says:

Some phenomenal changes have occurred during recent years in world consumption of phosphate rock. Russian consumption of domestic supplies has advanced from 25,000 short tons in 1926 to an estimated volume of 1,100,000 tons in 1937. In the United States, the only country other than Russia mining phosphate largely for domestic use, consumption has grown from 2,800,000 tons to 3,400,000 tons. Spectacular gains were made also by Germany, with deliveries showing a gain from 450,000 tons in 1926 to 1,000,000 tons in 1937. Combined Australian and New Zealand deliveries show an increase from 650,000 to 1,150,000 tons. While deliveries to Japan have increased steadily from 600,000 tons in 1926, the trade anticipates that 1938 deliveries will be far below the record of 1,375,000 tons established in 1937 when the trade was free of import control regulations.

France is the only leading world consumer of phosphate rock where consumption lags. Deliveries to France during 1937 of 1,250,000 short tons showed an increase over immediately preceding years but were one-third less than the annual average for five years ended 1930.

An important development of the past year was improved methods and increased production of concentrated phosphatic fertilizer, as, for example, potassium metaphosphate, proposed by the Bureau of Chemistry and Soils of the U.S. Department of Agriculture, which contains 60 per cent of phosphoric acid (P_2O_5) and 40 per cent of potash (K_2O), and calcium metaphosphate, prepared by a method perfected by the TVA, which contains 65 per cent of P_2O_5 and 35 per cent of CaO . Progress was made in the process of preparing pure phosphoric acid for fertilizer use.

It has been found that so-called aluminum toxicity of soils, which in some cases seriously impairs the productiveness of soils, is accentuated by lack of available phosphoric acid due to fixation in the soil by aluminum and can be corrected by application of superphosphate, which not only adds available phosphoric acid but tends to free the fixed phosphoric acid of the soil.

In view of the fact that soluble phosphates applied to the soil are quickly absorbed and fixed in the upper layers of the soil and hence do not reach the lower and more active root zone of plants, the Nevada Agricultural Experiment Station has undertaken to prepare an organic form of phosphate fertilizer which is not so quickly and firmly fixed in the soil and so is capable of penetrating more deeply into the plant-feeding zone. Progress was reported by that station during the year in developing a practical commercial method of preparing such an organo-phosphate by fermenting insoluble phosphates in glucose, and the efficiency of the product is being widely tested under various conditions.

Potash. Both foreign and domestic production and consumption of potash increased during the year. The closing of the Spanish mines has stimulated activity in this respect in other countries. The Soviet Republic has been especially active in developing its potash resources. The world's potash production is estimated to have been 2,950,000 short tons K_2O in 1937.

Domestic production of potash was 270,000 short tons of pure potash (K_2O) in 1937. Imports were about 350,000 tons, exports 62,000 tons, represent-

ing a substantial increase over 1936. Complete figures for 1938 are not yet available. However, an abundant and increasing supply and use of fertilizer-potash for many years to come seems assured.

Nitrogen. There was continued improvement of methods of manufacture and increased use of synthetic nitrogen compounds, assuring an adequate supply of this essential fertilizer constituent, independent of natural deposits. The available Chilean nitrate supply is, however, estimated to be 250,000,000 tons, enough to meet the world's needs for 100 years. In general, the use of nitrogen fertilizers is increasing. The present consumption of different products is estimated to be distributed about as follows: Ammonium sulphate, 47-49 per cent; cyanamid, 11-13 per cent; Chilean nitrate, 9-10 per cent; lime ammonium nitrate, 8-9 per cent; calcium nitrate, 7-8 per cent; synthetic sodium nitrate, 3-4 per cent; other synthetic nitrogen compounds, 9-12 per cent.

The United States is now an exporter as well as an importer of synthetic nitrogen fertilizer and is self-sufficient with regard to nitrogen, as well as phosphates and potash.

Bibliography. Fertilizers as a means of maintaining and increasing soil productivity and scientific research relating thereto are exhaustively treated, with a detailed bibliography, in the *Yearbook of the U.S. Department of Agriculture for 1938*, entitled "Soils and Men."

A book, *Theory and Practice in the Use of Fertilizers*, by F. E. Bear, New York, 1938, serves well its announced purpose of "bringing together in one volume the various points of view concerning fertilizer practice that have been developed by the many workers in this field since the time of Liebig and of Lawes and Gilbert."

Current progress in the production and use of fertilizers and the fertilizer industry and sources of supply in general was as heretofore recorded in *Fertilizer Review*, Washington, D. C.; *American Fertilizer*, Philadelphia, Pa.; *Commercial Fertilizer*, Atlanta, Ga.; *Experiment Station Record*, published monthly by the Office of Experiment Stations of the U.S. Department of Agriculture, with semi-annual indexes; and reports of the U.S. Department of Commerce.

FEY, MAJOR EMIL. An Austrian soldier and politician, committed suicide in Vienna, Mar. 16, 1938, where he was born on Mar. 17, 1888. Educated in the local schools, he saw service with the Austro-Hungarian Army during the World War. After his resignation from the army in 1919 he for a time edited the *Vaterlaendische Abend Zeitung*. Thereafter, he occupied himself with the organization and leadership of ex-service men's associations, and in 1930 he became active in the organization of the Vienna units of the Heimwehr, a private anti-Socialist military force.

On Oct. 17, 1932, Fey was appointed Minister for Security and with the establishment of the authoritarian state, he became vice-chancellor in the Dollfuss Cabinet on Sept. 11, 1933. Active in the fight against Nazis and Socialists, he was given supreme control over the police with the title of Minister of Police. In February, 1934, he was in command of the government and Heimwehr forces that crushed the Socialist movement in a brief civil war. In June he was transferred from the vice-chancellorship to the Ministry of Public Security, and on July 11 was named Commissioner of Emergency Measures for the Defense of the State. His role in the abortive Nazi putsch of July 25, 1934, in which Chancellor Dollfuss was

assassinated, was never fully explained, although he was completely cleared by the Austrian Military Court of Honor in March, 1937.

In the cabinet formed by Dr. Kurt Schuschnigg on July 30, 1934, he became Minister of the Interior, but with the reorganization of the government in October, 1935, he was dropped from this post. After repeated differences with Prince Starhemberg, leader of the Heimwehr, he was ousted from that organization on Oct. 2, 1936, for "subversive activities," but assumed active command of the Vienna Heimwehr, which seceded from the Starhemberg camp. After the annexation of Austria by Germany on Mar. 13, 1938, Fey, fearing for his safety, killed his wife and son and committed suicide. See AUSTRIA and GERMANY under *History*.

FIJI (fē'jē) ISLANDS. A British colony in the South Pacific, consisting of some 250 islands (80 inhabited) and its dependency—the islands of Rotuma. The largest islands are Viti Levu (4053 sq. mi.), Vanua Levu (2128 sq. mi.), Taveuni (166 sq. mi.), and Kandavu (165 sq. mi.). Total area, including the islands of Rotuma, 7083 square miles; total population (Jan. 1, 1938, estimate), 205,397 (including 99,595 Fijians, 89,333 East Indians, and 4238 Europeans), as compared with 198,379 (1936 census). During 1936 there were 7634 births, 4056 deaths, and 1828 marriages. Chief towns: Suva (capital, on Viti Levu), 15,522 inhabitants; Levuka (on Ovalau).

Production and Trade. Sugar, copra, molasses, bananas, trocas shell, butter, pineapples, and native foodstuffs were the principal products. A sugar quota of 129,300 long tons was allocated to Fiji for 1938-39; in 1937 the value of sugar exported was £1,388,681. Gold mining is increasing in importance, the value of gold produced in 1937 totaled £192,300, while that for 1938 was estimated at £675,125. There were 2260 miles of roads in 1937; a new road, 324 miles in length, around the island of Viti Levu, was completed during 1938. In 1937 imports were valued at £1,760,744; exports, £2,213,657.

Government. For 1937 revenue totaled £947,497; expenditure, £878,104; public debt, £1,414,030. Budget for 1938, estimated revenue, £926,051; expenditure, £922,306. The government is administered by a governor (appointed by the Crown) assisted by an executive council of 7 members, and a legislative council (of which the governor is president) of 31 members (16 official, 5 European, 5 native, and 5 Indian). Native administration is carried on through the chiefs subject to the governor's supervision. Governor of Fiji and High Commissioner for the Western Pacific, Sir Harry C. Luke, who succeeded Sir Arthur Richards late in 1938.

FILMS. See MOTION PICTURES; PHOTOGRAPHY.

FINANCE. See FINANCIAL REVIEW; PUBLIC FINANCE; UNITED STATES under *Administration* and sections under *Finance* in countries.

FINANCIAL REVIEW. The year 1938 in a number of respects presented a financial situation that was the reverse of that of the year before. Whereas 1937 marked the culmination of the rise in stock prices which began in 1933, and security quotations declined sharply during the closing months of the year, share quotations rose briskly during the last half of 1938 after additional declines had been registered during the first half of the year. Whereas efforts were made by the monetary authorities to reduce bank reserves and to discourage a further expansion of bank credit dur-

ing 1937, 1938 witnessed a major intensification of easy money policies and an effort to bring about a resumption of business recovery through bank credit expansion. The restrictive credit policies pursued in 1937 brought a decline in high-grade bond prices, particularly in the spring and early summer of the year. In 1938, on the other hand, the expansion of excess reserves to record levels caused prices of gilt-edge obligations to rise accordingly.

The war scare in Europe resulting from the crisis over Czecho-Slovakia caused an acceleration of the flight of capital from that continent to the United States. As a result of the capital inflow and the greatly increased export surplus, which amounted to \$1,133,000,000 for the year, almost \$2,000,000,000 of gold was shipped to the United States, chiefly from Great Britain, and the American monetary gold stock rose to a new peak level well above \$14,000,000,000. Owing to the elimination of the inactive gold fund by the Treasury, this great influx of gold was permitted to increase member-bank excess reserves, bringing them to a new high record level by December, 1938.

With business revival in full swing by the end of the year, the question arose whether the credit situation was not getting out of hand and whether the authorities would be able to adopt restrictive measures at some future date should such appear necessary. Owing to the fact that a business recession followed so quickly upon the restrictive measures adopted in 1936-37, the authorities are certain to be far more hesitant about doing so again.

Two main solutions to the problem were under consideration at the end of the year. First, consideration was given to an amendment of the banking act to permit increases in legal reserve requirements by the Board of Governors of the Federal Reserve System beyond the maximum limits authorized in the present law. Secondly, further study was given to ways and means of discouraging the influx of capital from abroad, a problem that had been considered by an interdepartmental Government committee previously without result. An embargo upon gold imports has been regarded as impracticable because it would lead to wide disturbances in the foreign exchange market, and a probable sharp rise in the foreign exchange quotation of the dollar. The imposition of a special tax on foreign capital placed here has been opposed, hitherto, because it would probably lead to reprisals in foreign countries where American capital is invested and because it is inconsistent with the policy of Secretary of State Hull of removing obstacles to freer commerce and financial relations between countries as far as possible.

The volume of new financing remained distinctly sub-normal, as compared to the '20's, but toward the end of the year there was an increase in such activity. While the larger part of the securities offered was again refunding in character, the proportion of flotations representing the raising of new capital was larger than in several recent years. Considerable concern developed among investment bankers, however, because of the sharp increase in the proportion of new offerings effected through private placements with one or two financial institutions, rather than through public flotation. With business recovery, a substantial increase in new financing is anticipated, but this would not prove helpful to investment bankers if a large number of issues are placed privately rather than through banking groups.

The year 1938 was also marked by a substantial

increase in the volume of mortgage financing. Early in the year, Congress approved a number of amendments to the National Housing Act which liberalized the terms under which mortgages could be insured with the FHA. Also, the U.S. Housing Authority launched its program of making loans and grants to local agencies for the construction of slum clearance projects. Life insurance companies and other institutional investors increased their holdings of mortgages freely, and a sharp rise in the volume of residential building during the closing months of the year was in part stimulated by the ready access of builders to the mortgage market.

Security Markets. The *New York Times* average of quotations of 50 stocks reached the low-level for the year in March at \$69.70, while the high point was touched in November at \$110.74. Stock prices underwent a series of irregular advances and declines during the first half of the year, but on June 20 a decisive upturn began which was accelerated when the steel manufacturing companies reduced their prices and reports began to be received that buying of manufactured goods and raw materials was on the increase following the contraction in inventories during the preceding nine months, when production ruled well below the current level of consumption in many industries. The recovery in stock prices that began in June continued without significant interruption until early in September, when the European war scare brought a substantial decline, as it was widely feared that the outbreak of hostilities in Europe would cause the closing of the security markets, just as in 1914. With the reaching of an agreement among the European powers at Munich, the rise in stock prices was resumed and, by November, a new high level was reached roughly comparable to that of October, 1937. In the closing weeks of the year, the pause in the business recovery, relatively heavy selling to realize tax losses, which was encouraged by the liberalization of the capital gains tax early in the year, and renewed uneasiness over the European situation caused considerable irregularity in security prices. High and low prices month by month during 1938 were as follows:

NEW YORK TIMES STOCK MARKET AVERAGE
FOR 1938

[50 Stocks—25 Rails and 25 Industrials]

	High	Low	Last
January	96.01	83.99	86.27
February	95.21	82.76	92.46
March	94.18	69.70	70.80
April	84.98	72.31	77.92
May	84.95	75.05	76.14
June	97.67	75.97	94.85
July	103.94	94.44	99.49

Sales on the New York Stock Exchange in 1938 were reported to aggregate 297,446,059 shares, as compared with 409,468,885 in 1937. Sales of bonds on the Exchange totaled \$1,859,525,825, which compared with \$2,790,323,300 in 1937. The total value of all listed stocks on Nov. 30, 1938, was \$40,081,000,000, as against \$46,716,000,000 on Nov. 30, 1937.

Statistics published by the Securities and Exchange Commission revealed that small investors continued to absorb stocks on a large scale during the first four months of the year. These figures on odd-lot trading, which are published regularly, showed that odd-lot purchases exceeded odd-lot

sales by several million shares during that period. When the market turned up sharply in June, however, the situation was reversed and a moderate amount of odd-lot liquidation occurred. It was indicated once again that the small investor in stocks tends to be a "bargain hunter," and that odd-lot buying is particularly heavy on balance during a sharp decline in security prices and when quotations are maintained at a relatively low level.

High-grade bond prices displayed a rising tendency during most of the year, under the stimulus of rising bank reserves and a relative paucity of new issues. Even the announcement of a greatly extended Government spending program, with its promise of an increased volume of new Treasury issues, depressed quotations only momentarily. Speculative bonds advanced with stocks during the second half of the year, as expanding business activity promised an increase in corporate earnings. The course of corporate bond prices, as measured by indices of the Standard Statistics Company, was as follows:

AVERAGES OF BOND PRICES

	Total	Corporate		
		Industrial	Railroad	Utility

Stock Exchange Regulation. Sweeping and far-reaching changes in the organization of the New York Stock Exchange were effected during 1938. The Securities and Exchange Commission, which acquired broad regulatory powers over the Exchange under the Securities Exchange Act of 1934, had been very critical of a number of practices that had prevailed for a number of years past, but had found the then administration of the New York Stock Exchange averse to making many of the fundamental changes that it proposed. While the S.E.C. possessed the power to regulate the Exchange directly in any way that it pleased, it preferred not to assume the responsibility, but rather wanted the Exchange's officials to make the desired changes themselves. This finally led to the appointment of a Committee for the Study of the Organization and Administration of the New York Stock Exchange on Dec. 10, 1937, which was headed by Carle C. Conway, Chairman of the Board of the Continental Can Company. The committee included several other non-members of the New York Stock Exchange, to indicate that the interests of the nation's industry and the public at large, as well as of Exchange members, would be considered. This committee reported to Charles R. Gay, the then president of the Exchange, on January 27. It recommended that the presidency of the Exchange be made a salaried office, to give it more independence, and that the administration of the institution be strengthened generally by divorcing it from the membership, so that it would be less subject to pressure from members. It proposed that the Board of Governors, the governing body within the Exchange, be reduced in number from 50 to 32, of whom only 15 would be members of the Exchange, 6 non-member partners of New

York member firms, 6 partners of firms outside of New York City, and 3 public representatives. The paid president and the chairman of the board of the Exchange would be the other two governors. It was also proposed by the committee on organization and administration that constant study be made of financial trends to assure that the Exchange machinery would be kept up to date to serve the public as circumstances required.

This plan of organization was adopted by the exchange membership, which marked the end of the period of friction between the New York Stock Exchange and the Securities and Exchange Commission. William McC. Martin, Jr., who was secretary of the committee on organization and administration, was elected president of the Stock Exchange on May 9, and he immediately made co-operation with the S.E.C. a cardinal feature of his administration.

At the same time, the Stock Exchange authorities embarked upon a program designed to permit the members of the Exchange to conduct their business profitably despite the sharp contraction in the volume of turnover, partly attributable to restrictions on margin trading, floor trading, and transactions by officers, directors, and large stockholders imposed by the Securities Exchange Act of 1934. Among the measures actively considered were an increase in the number of listed issues through the listing of the securities of smaller companies, the admission of associate members to the Exchange to encourage non-member firms and financial institutions to bring business to the floor of the Exchange, further increases in commission rates, and the adoption of measures for reducing operating expenses of member firms. One step in this direction was the adoption of a semi-weekly settlement system in place of the "skip-a-day" system of settlement previously in effect. However, after several weeks of experience with the system of two settlements a week, which was expected to eliminate a good deal of bookkeeping in commission houses, it was found unsatisfactory and in December the members returned to the skip-a-day settlement system. Many brokers believed that if the settlement had been made on a weekly basis, the economies would have been sufficient to establish the change permanently.

The failure of Richard Whitney and Company on March 8 proved a particularly severe blow to the "old guard" among stock-exchange members, and resulted in the complete collapse of resistance to the changes proposed by the S.E.C. and the committee on organization and administration. Because Mr. Whitney had been the president of the Exchange during the period when Federal regulation was most strenuously opposed, and led the faction which insisted that regulation would seriously impair the ability of the institution to maintain a free and open market for securities, the disclosure that clients' securities had been stolen by the former president of the institution proved particularly shocking. The S.E.C. made a thorough investigation of the circumstances, and proposed a number of changes which the Exchange adopted for giving additional protection to clients of brokerage houses through audits and restrictions on the use of funds belonging to customers by members. It was also proposed by the S.E.C. that an independent trust company be established to hold clients' securities and cash for brokers, and studies to carry out this recommendation were launched by the Stock Exchange.

Congress adopted in June a series of amend-

ments to the Securities Exchange Act of 1934 largely extending the jurisdiction of the S.E.C. over the over-the-counter markets. The measure, known as the Maloney Act, provided that over-the-counter security dealers, aside from municipal dealers, are to be organized into a national association, which in turn may be divided into various local or specialized groups of dealers. The Securities and Exchange Commission is then to use these associations to regulate over-the-counter dealers just as the stock exchanges have been used to regulate their members. A committee of the New York Stock Exchange also urged that securities traded in by members of these associations be subject to some of the requirements for the disclosure of information that are applicable to registered securities on national security exchanges.

New Financing. Depressed business conditions and inactivity in the security markets during the first half of the year greatly reduced the volume of private financing in the first six months of 1938. Therefore, rising quotations and the greatly improved business outlook brought a substantial revival of both refunding and issues to raise new capital. At the end of the year, investment houses reported that they were working actively on a large volume of new offerings for 1939.

Out of the total of \$4,384,201,545 of new financing consummated during 1938, \$2,057,013,919 was for refunding purposes. Thus, 47 per cent of new issues were refunding in character in 1938, about the same proportion as in 1937.

Public offerings of new securities varied from month to month as follows:

NEW PUBLIC FINANCING, 1938

[Thousands of dollars]

Month	Total	New capital	Refunding
January	121,444	92,387	29,056
February	199,188	82,072	117,116
March	245,178	126,260	118,918
April	352,020	197,448	154,572
May	216,724	156,640	60,084
June	505,517	345,257	160,260
July	464,920	389,896	75,024
August	415,474	180,228	235,247
September	196,697	120,362	76,335
October	762,948	164,682	598,266
November	388,588	218,907	169,680
December	452,677	218,478	234,199

Institutional investors displayed a very keen interest in high-grade security issues throughout the year. The life insurance companies, which had added \$672,000,000 of Government bonds to their portfolios in 1937, reported an increase of only \$188,000,000 in such holdings for 1938. On the other hand, they increased their holdings of railroad, public utility, and industrial corporation

issues by \$719,000,000, as against an increase of \$656,000,000 in 1937. In their eagerness to acquire additional obligations, many of the larger institutions bought whole issues of securities directly from the issuers, such private placements for 1938 being estimated at \$650,000,000, as against some \$500,000,000 in 1937. New security issues consummated during 1938 compared with the volume of previous years as shown in table at bottom of this page.

The Federal Government, which had restricted itself largely to refunding during 1937, raised substantial amounts of new money during 1938 in order to finance the beginning of the vast lending-spending program authorized by Congress in the spring of the year. The Treasury increased its debt by more than \$2,000,000,000 through sales of bonds and notes, and also arranged for separate financing by the Reconstruction Finance Corporation and the Commodity Credit Corporation during the year. The banks furnished the chief market for these sales of additional issues to finance the Federal deficit.

Foreign financing was again at a very low ebb, owing to the unwillingness of investors to purchase bonds of countries in default on private obligations and the restriction on financing by countries in default in debts to the United States Government under the Johnson Act. An Argentine loan, however, was placed in New York without difficulty in November.

International Capital Movements. "Hot money" again became one of the most urgent and difficult financial problems confronting the United States during the last half year of 1938. The European war scare brought a resumption of the large-scale transfer of capital from Europe to the United States, although in the first six months there was considerable repatriation of foreign capital from this country. During the third quarter of the year, the inflow of foreign capital aggregated \$407,100,000, which compared with reported net capital imports of \$350,000,000 in the corresponding period of 1937. As in 1937, incoming foreign capital was deposited almost entirely in American banks, only small amounts being used to purchase securities. The quarterly statements of capital movements, as published by the Treasury Department, are given on page 252.

As a result of the renewed shift of nervous money from Europe to the United States, as well as the greatly increased export surplus, gold imports into this country during the year assumed record proportions. They fell to a low level during the first seven months of the year, but the Czechoslovakian crisis brought a veritable flood of foreign capital to the United States. The size of the

* Inflow less than \$50,000.

gold imports into the United States and the chief sources from which they came are shown in the table below.

It will be noted that the bulk of the gold came from Great Britain. This did not mean that the influx of capital was chiefly British-owned. Rather, it indicated that nervous money which had previously been transferred from other countries to London

the United States and building up foreign deposit balances in this country. Should this continue, the U.S. Government is likely to make a more serious attempt to check the inflow of gold, or at least to work out ways and means for preventing the inflation of bank reserves because of these huge capital transfers. Since the policy of the Government was to encourage credit inflation during the

was largely shifted to the United States because of the tense European political situation. Even after Munich the fear prevailed that war scares might become chronic on that continent. At the same time, the improved economic outlook in the United States and the strong isolationist sentiment in this country were regarded as making the United States more desirable than ever as a haven for refugee capital. Furthermore, the declining trend in quotations of European currencies in the foreign exchange markets during the latter half of the year and the increased taxation threatened in Europe by the enlargement of armament programs encouraged further transfers of capital from European countries, including Great Britain, to the United States.

The monetary gold stock of the United States rose to unprecedentedly high levels during the year. This may be seen from the accompanying table.

Under these conditions, the surplus gold problem is naturally attracting increasing attention. As this country absorbs an increasing percentage of the world stock of gold, the monetary role played by the yellow metal dwindles. It is no longer being used as a means of stabilizing foreign exchange rates automatically, as was the case when leading countries were on the gold standard, and it is no longer being allowed by central bank authorities to regulate currency and credit conditions within each country. The primary role of gold now is to furnish a means for transferring capital to

year, the problem did not receive as much attention in 1938 as is likely to be the case during 1939 and thereafter, should the heavy gold inflow persist.

Another phase of this heavy capital influx was weakness in the leading European exchanges, particularly the pound sterling. From a level above \$5 early in the year, sterling fell to a low point around \$4.60 during the September international

ANALYSIS OF CHANGES IN UNITED STATES MONETARY GOLD STOCKS

[In millions of dollars]

Year or month	Gold stock at end of year or month	Increase in total inactive gold stock	Net gold import	Net release from ear-mark	Domestic gold production

Dec.	14,512	199.6	240.5	62.4

crisis, and did not rally much from that low level thereafter. Further weakness in the leading European currencies would probably raise the question as to whether the monetary policy of the United States should be reconsidered, particularly if lower sterling should be accompanied by declining prices for commodities enjoying a world market, such as grains and cotton.

FINE ARTS. See ART EXHIBITIONS; ART MUSEUMS; LITERATURE, ENGLISH AND AMERICAN; PAINTINGS; SCULPTURE, ETC.

FINLAND. A republic of Northern Europe. Capital, Helsinki (Helsingfors).

Area and Population. Finland has a land area of 134,547 square miles and a population estimated at 3,807,163 in 1936 (3,667,067 at the 1930 census). Of the 1936 population, 3,012,986 lived in rural and 794,177 in urban communities. Finnish-speaking inhabitants comprised 89.4 per cent of the total; Swedish-speaking, 10.1 per cent. Living births in 1936 numbered 68,895 (19.2 per 1000); deaths, 49,723 (13.8 per 1000); marriages, 29,841 (8.3). Estimated populations of the chief cities in 1936 were: Helsinki (Helsingfors), 283,598; Viipuri (Viiborg), 73,227; Turku (Åbo), 70,688; Tampere (Tammerfors), 61,208; Vaasa (Vasa), 31,499; Oulu (Uleåborg), 26,446; Lahti, 24,371; Kuopio, 24,337. Swedish place names are given above in parentheses.

Education and Religion. Less than 1 per cent of the adult population was illiterate in 1930. The population of school age (7 to 15 years) was 586,594 in 1935. School attendance was: Primary, 502,189 in 1935-36; secondary, 50,276 in 1935-36; universities and schools for higher education, 8121 in 1936-37. The population on Jan. 1, 1937, included 3,654,751 Lutherans, 70,445 Greek Catholics, 9909 Baptists and other evangelical church members, 1541 Roman Catholics, 1756 Jews, and 347 Moslems.

Production. At the 1930 census 60 per cent of the working population was engaged in agriculture and 16.8 per cent in industry. About 6,310,000 acres (7.3 per cent of the total area) were under cultivation in 1936. Crops harvested in 1937 were valued at about 7,025,000,000 marks. Yields of the chief cereals in 1938 were (in metric tons): Wheat, 217,000; barley, 199,000; rye, 373,000; oats, 817,000. The 1937 potato crop was 50,979,000 bu.; flax and hemp, 2,278,000 lb.; hay (1936), 3,708,000 metric tons. Livestock statistics for 1936 were: Cattle, 1,879,000; sheep, 1,023,000; goats, 13,000; swine, 459,000; horses, 369,000; reindeer, 100,000. Animal products in the same year were: Butter, 61,363,000 lb.; cheese, 22,011,000 lb. Some asbestos, copper, gold, lead, peat, and zinc are mined.

Industrial production in 1936 was valued at 16,122,000 marks. The principal industrial products for that year were: Wood pulp, 1,975,932 metric tons; paper (excluding wallpaper), 1,164,154,000 lb.; cardboard, 274,872,000 lb.; lumber, 2,386,000 bd. ft.; spools (for thread), 3,879,000 gross; shoes and galoshes, 4,310,000 pairs; cotton yarn and fabric, 24,923,000 lb.; bricks, 121,053,000; matches, 369,701,000 boxes; cigarettes, 3,620,000,000; margarine, 25,889,000 lb.

Foreign Trade. General imports in 1938 totaled 8,612,300,000 marks (9,306,423,000 in 1937) and general exports were 8,431,100,000 marks (9,379,724,000 in 1937). The chief 1937 imports in order of value were metals and their manufactures, machinery, coal and coke, chemicals, and medicines. The principal exports were sawn and unplanned wood, wood pulp, newsprint and other paper, ply-

wood veneers. The United Kingdom supplied 19 per cent of the 1937 imports by value, Germany 16.4, and the United States 9.3. Of the exports, 43.1 per cent went to the United Kingdom, 12.8 to Germany, and 7.9 to the United States. Imports from the United States in 1938 were valued at 893,549,000 marks; exports to the United States, 776,126,000 marks.

Finance. The budget estimates (ordinary and extraordinary) for 1939 placed revenue at 5,211,300,000 marks and expenditure at 5,208,800,000 as compared with the estimates of 4,436,200,000 and 4,435,300,000, respectively, for 1938. Actual revenue in 1937 totaled 5,984,500,000 marks and expenditure 5,898,100,000, leaving a surplus of 86,400,000. The public debt was 3,251,300,000 marks on Dec. 31, 1938, compared with 3,452,500,000 marks on Dec. 31, 1937. The average exchange value of the mark was \$0.0219 for 1936, \$0.0218 for 1937, and \$0.0216 for 1938.

Transportation. The railway mileage on Jan. 1, 1937, was 3582 (state lines, 3424). A new line from Pori to Haapamäki (119 miles) was opened officially on Oct. 15, 1938. Highways and roads aggregated 40,910 miles in 1937; the number of automobiles (Jan. 1, 1938) was 42,267. The state lines in 1936 carried 20,856,948 passengers and 13,671,000 metric tons of freight, the gross receipts totaling 925,908,000 marks. Statistics of internal civil aviation in 1937 were: Miles flown, 204,300; passengers, 7513; cargo, 369,800 lb. The gross tonnage of the Finnish merchant marine on June 30, 1938, was 579,600 (549,100 on June 30, 1937). A total of 8022 vessels of 5,850,000 net registered tons entered Finnish ports in the foreign trade during 1936.

Government. Executive power is vested in a president elected for six years by 300 electors, chosen by direct suffrage in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 200 members of the Diet are elected by direct vote of all citizens, male and female, 24 years or more of age. The cabinet is appointed by the President, but is responsible to the Diet. President in 1938, Kyösti Kallio, who assumed office Mar. 1, 1937. Premier, Aimo Kaarlo Cajander (National Progressive), heading a cabinet comprising representatives of the Social Democratic, Agrarian, and National Progressive parties. The standing of the parties in the Diet following the election of July, 1936, was: Social Democrats, 83; Agrarians, 53; Swedish People's party, 21; National Coalition, 20; Patriotic National Movement (pro-Fascist), 14; National Progressives, 7; others, 2.

History. The struggle between liberal and anti-liberal forces in Finland continued during 1938 following the victory of the pro-democratic groups in the 1937 presidential election (see 1937 YEAR BOOK, p. 251). The resignation of Foreign Minister Rudolf Holsti on November 16 was considered a triumph for the conservative and anti-liberal elements. His ardent democratic sympathies had earned him the animosity of the German Government, which was reported to have made strong representations to the Finnish Government concerning his criticisms of Chancellor Hitler at the League of Nations Assembly meeting in Geneva in September. His resignation brought no change in Finland's foreign policy as outlined by President Kallio in 1937. It was followed on November 22 by the dissolution of the pro-Fascist Patriotic National Movement and the suspension of the party's 18 newspapers.

Meanwhile, Finland had been speeding prepara-

tions to preserve its neutrality in an expected Russo-German war by strengthening national defenses and by closer diplomatic and economic collaboration with the other Scandinavian and Baltic states. The Diet on May 20 passed a law raising the income and property taxes for the years 1939 to 1943 by 20 per cent to finance an enlarged armament program for the period 1938-44, calling for an expenditure of 2,710,000,000 marks. The law provided for the issuance of a loan if it became necessary to complete the arms program before the appointed date. Finland joined with Sweden, Norway, and Denmark in formulating a common neutrality program and with all of the other Oslo powers in repudiating the sanctions obligations of the League Covenant and following a common commercial policy. See DENMARK under *History* for details.

To forestall the expected race between Germany and the Soviet Union to seize control of the strategically important Åland Islands upon the outbreak of a European war, the Finnish Government reached an agreement with Sweden early in September for revision of the demilitarization treaty of 1921 to permit fortification of the islands. The announcement of this program was followed on September 12 by a visit to Finland of Gen. Olof Thornell, chief of the Swedish defense staff, to inspect the Finnish frontier defenses. Fortification of the Åland Islands, which form a department of Finland, encountered the almost unanimous opposition of the 30,000 inhabitants of the islands and their autonomous parliament. They likewise opposed the introduction of military conscription. Conferences on the Åland Islands issue were held in Helsinki commencing November 4 by the Finnish Cabinet, a Swedish delegation headed by Foreign Minister Sandler, and representatives of the Åland parliament. But no agreement with the Åland islanders and with the League of Nations had been reached by the end of 1938.

During the European crisis over Czecho-Slovakia in September the Finnish Government protested to Moscow (September 19) against alleged violations of Finland's territorial waters and land frontiers by Soviet submarines and airplanes, respectively. It was announced on December 26, however, that the final delimitation of the Finnish-Soviet frontier had been completed with the exchange of notes between the two governments. Finnish hostility toward the Soviet Union was spurred by the campaign of forcible denationalization carried on by Soviet authorities among the Finnish-speaking inhabitants of Soviet Karelia, adjoining Finland's eastern frontier.

The Fascist movement within Finland received a new lease on life on December 1 when the Magistrate's Court at Helsinki refused to enforce the government's order dissolving the Patriotic National Movement. Consequently, the ban on the party and its newspapers was ended immediately. The government then appealed from the Magistrate's Court decision. On December 13 Premier Cajander displayed his resistance to both Fascist and German pressure by appointing Elias Erkkö, a liberal publisher and member of the Progressive party, as Foreign Minister in place of Dr. Holsti.

FIRE INSURANCE. See **INSURANCE.**

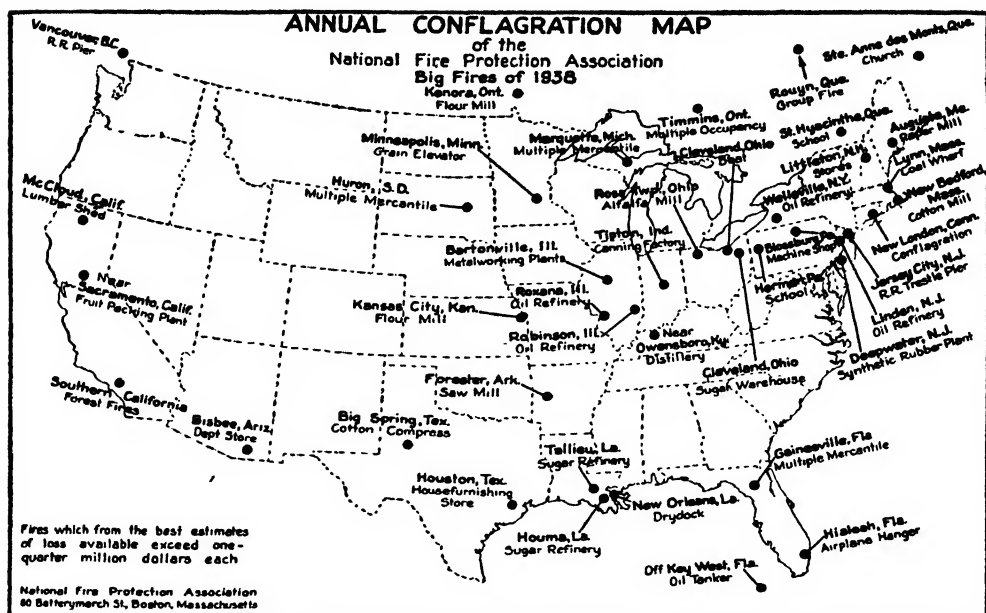

FIRE PROTECTION. The increase in the 1938 fire loss over that of 1937, swinging back to and somewhat exceeding the total for 1936, is subject to no special interpretation. The increase of 13 "large loss" fires over those of 1937 is not a complete explanation. There was no drop in fire-

prevention activities and the increased losses were pretty well distributed throughout the year. The hurricane and floods that devastated large areas on Long Island and in New England in September, like other catastrophes that have been visited upon other sections of the country from time to time, placed an overwhelming burden upon the fire-protection forces of the regions affected. Fire, to the public mind, is a minor and incidental feature of such disasters, but it is only through herculean efforts of the public fire departments, and the fire-protection fraternity in general, that fire does not multiply many fold the destruction wrought by the elements. With normal fire-protection facilities seriously impaired, the fire-protection forces must cope with extraordinary hazards, as well as meeting all sorts of emergency calls outside the line of usual fire duty.

With the unique combination of flood, hurricane, and tidal wave it is indeed fortunate that fire did not take a greater toll. The New London, Conn., conflagration was stopped by the New London fire department with its limited personnel and equipment, the outside aid that might otherwise have been quickly assembled from other communities being unavailable because of blocked roads. The fire in Peterboro, N. H., though involving a much smaller monetary loss, was equally serious in proportion to the size of the community. Despite crippling of fire-alarm service, tremendous damage to electric power lines and communication service, thousands of chimneys fallen or cracked, roofs off buildings, gasoline and oil tanks damaged by flood or wind, and other damage too extensive to enumerate, the only major fires reported were those in New London and Peterboro. It is possible that during 1939 the heavy fall of timber in New England, due to the hurricane, may be responsible for many additional fires. The devastation of forests was too great to make early clearing of the fallen trees possible and they still lie, in countless numbers, slowly drying into quickly ignitable material. See **FORESTRY.**

Training and instruction schools for firemen have gone on multiplying during 1938 at an accelerated pace. Firemen's training programs, operated on a state-wide basis, last year reached over 50,000 firemen. The schools have already been recognized as of incalculable importance in making it possible for firemen to save more lives and property and to advance the all-around efficiency of fire departments.

Firemen's training did not receive very rapid acceptance by the fire departments of the country. In 1883 one of the first fire department drill schools (as we know them today) was established in New York City. The idea was to give firemen practice in the use of scaling ladders, to develop agility, and to accustom them to working on the upper stories of buildings. Twenty years later, firemen were still relatively untrained in the majority of fire departments in the United States and Canada. Even today we find a large city like Cleveland without a drill school. However, there are now about 500 cities in the United States and Canada with populations in excess of 20,000; of these we find 160 with drill towers and more than 250 have some sort of training program. Every one of the cities with these drill-school facilities has been generous in opening its drill sessions to firemen from neighboring cities and towns which do not have training equipment. The experienced drill masters of these cities have co-operated in most of the state-wide programs to provide training to all firemen.

The George-Deen Federal act of 1936 provided an appropriation of \$4,000,000 available to the states for industrial training. The act specifically authorizes the training of public employees under this classification. The vocational education departments, having already studied firemen's training work and finding it a field in which they could register immediate results, have been able to more effectively take hold of local training programs. More important, they have modest appropriations which may be applied to the employment of itinerant instructors and to reimbursing instructors from fire departments for traveling expenses when they are working outside their own city.

Another Federal act may not prove so helpful in furthering the fire-prevention cause. The watchman is a traditionally important element in fire protection. The Wages and Hours legislation will, according to views of some employers, make it economically difficult to continue watchman service under the conditions that have formerly obtained. In many plants compliance with the law would mean practically doubling the number of watchmen in order to secure the same protection. The alternative of employing men physically or mentally handicapped for this particular service, thus securing an exemption from the application of the minimum-wage requirement, might be unfortunate as regards fire protection.

A very considerable interest in visual education through the medium of the motion picture has been awakened during the past year by the production of forceful and attractive films which have made their appearance in different sections of the country led by *U.S. Fire Fighters*, the striking picture of March of Time released in September. One of these films, produced on the Pacific coast, emphasizes the hazards of Fourth of July celebrations and is destined to be very helpful in advancing the campaign for state regulation of fireworks which is now getting effectively under way, supported by various public welfare organizations.

The 1938 U.S. Fire Loss. The preliminary estimate of the fire loss in the United States for the year 1938 is \$302,050,000 (based on estimates com-

plied by the National Board of Fire Underwriters). This is \$17,330,000 more than the 1937 preliminary loss estimate, and shows the result of the upward swing in losses begun in July.

COMPARATIVE MONTHLY LOSS ESTIMATES

	1936	1937	1938
January	\$ 27,729,930	\$ 25,069,895	\$ 27,673,337
February	30,909,896	28,654,962	26,472,626
March	29,177,406	29,319,029	29,050,968
April	25,786,835	26,663,854	25,616,112
May	21,479,380	21,437,739	22,917,577
June	20,407,485	19,524,765	19,473,617
July	22,357,020	19,812,485	20,434,688
August	21,714,495	19,767,314	20,821,184
September	20,413,537	19,349,756	23,372,528
October	20,439,136	21,097,670	24,797,624
November	20,808,497	23,849,673	28,658,695
December	30,133,628	30,172,952	32,758,044
Total	\$293,357,245	\$284,720,094	\$302,050,000

Adjusted loss figures ... \$266,659,449 \$253,859,796 (*)

* Released later in year.

NOTE. It may be noted that the final loss figures for both 1936 and 1937 are less than the preliminary loss figures for those years. It may be assumed, therefore, that the adjusted loss figure for 1938 will also be lower than the preliminary estimate.

The 1938 fire loss brings the total fire waste in the United States during the past 23 years up to \$9,234,980,237, which is an annual average about \$400,000,000. The following table gives the annual fire losses by years since 1916.

1916	\$258,377,952	1928	\$464,607,102
1917	289,535,050	1929	459,445,778
1918	353,878,876	1930	501,980,624
1919	320,540,399	1931	451,643,866
1920	447,886,677	1932	406,885,959
1921	495,406,012	1933	271,453,189
1922	506,541,001	1934	271,197,296
1923	535,372,782	1935	235,263,401
1924	549,062,124	1936	266,659,449
1925	559,418,184	1937	253,859,796
1926	561,980,751	1938 .. (Est.)	302,050,000
1927	472,933,969		

During the year 1938 there were reported to the N.F.P.A. Department of Fire Record 36 fires in the United States, involving a loss estimated at

\$250,000 or more each. This is an increase of 13 fires over 1937, but is only three fires above the average number of such fires for the past five years. During 1938 there were six fires in this classification in Canada, which compares with two fires in 1937. The locations of these 42 large-loss fires are shown on the accompanying annual conflagration map.

Seventeen fires caused losses of \$500,000 or more, including five which were of \$1,000,000 or more. The largest loss of the year, aside from the \$3,000,000 loss in the series of forest fires in southern California, during the week of November 23, was the whiskey distillery fire in Owensboro, Ky., on November 12, with a loss of \$1,800,000.

A total of 61 lives were lost in 6 of these 41 big fires of the year. Forty-six of these lives were lost in the school fire in St. Hyacinthe, Que., on January 18.

FIRESTONE, HARVEY SAMUEL. A pioneer in the American rubber industry, died in Miami Beach, Fla., Feb. 7, 1938; born Columbiana County, Ohio, Dec. 20, 1868. The son of a farmer, he was graduated from local schools and later attended business college in Cleveland. He entered business as a bookkeeper, and subsequently sold flavoring extracts until he obtained, in 1894, a position with the Columbus Buggy Co.

The solid rubber tire for buggies, introduced in America in the early 1890's, convinced Mr. Firestone that rubber tires offered great promise in the future of transportation. He established a small business in Chicago under the name of the Firestone-Victor Rubber Co. in 1896. In 1889 he sold this company at a substantial profit, and on Aug. 3, 1900, founded the Firestone Tire & Rubber Co. in Akron, Ohio. That business developed rapidly with the growth of the automobile industry and within a few years began the establishment of sales outlets in foreign countries. The number of employees of the company grew from 17 at its organization to over 48,000 in 1937.

The early days of the company were marked by frequent clashes with patent pools which then dominated the rubber industry, but gradually Mr. Firestone's efforts freed the industry of shackles that stifled growth and would have cost car owners many millions of dollars. Outstanding developments of the company include: The "straight-side" tire, replacing the "clincher" type; the first all-rubber non-skid tread; the first commercially practicable demountable rim; the first balloon tire; and the first tire for tractors and other wheeled farm implements.

At the close of the World War, when railroad yards were clogged and shipments lagged, Mr. Firestone organized the "ship-by-truck" movement to help relieve the country's transportation crisis. The motor truck was relatively new, but Mr. Firestone believed that, with effective organization, it could perform the task. He established bureaus in 80 cities, offering free service to shippers and truck operators in the co-ordination of their needs and facilities. The impetus supplied by this plan introduced in the movement of goods by truck upon a broad scale. In 1920 Mr. Firestone instituted a campaign for good roads which rendered effective service in promoting America's present system of improved highways.

Upon the enactment of the Stevenson Rubber Restriction scheme of 1922, Mr. Firestone proclaimed the plan economically wrong and opened offices in Washington for a campaign against it. In 1928, after defeat of the restriction, his friends

and admirers presented him with a medal in recognition of his services in breaking the English rubber price control, which had cost American motorists millions of dollars each year of its existence.

His interest in the assurance to America of an independent source of supply of rubber led Mr. Firestone to investigate the rubber-growing possibilities in many tropical countries. These investigations convinced him that Liberia, in West Africa, had great potentialities as a source of rubber for the United States. In 1925 he obtained the right to lease for 99 years up to 1,000,000 acres of land in Liberia, and by 1938, 70,000 acres had been planted to rubber and additional large tracts were under development by Firestone Plantations Company.

Mr. Firestone was the first rubber manufacturer to establish a system of auto supply and service stores to supplement and assist independent dealers. In 1938 his company had established more than 600 of these retail outlets.

In 1932 Mr. Firestone retired as president to become chairman of the board of directors of the parent Firestone company and its major subsidiaries in America and abroad.

During the World War, Mr. Firestone was a member of the Ohio Council of National Defense; was instrumental in organizing the rubber division of the War Industries Board; and served as president of the Rubber Manufacturers' Association (1916-18), organizing the Association's war activities. He was president of the Ohio Council of Churches during 1923-24; president of the City Planning Commission of Akron for several years; and a member of many other religious, public, and charitable organizations. In 1922 he published *Rubber: Its History and Development*; and in 1926, in collaboration with Samuel Crowther, *Men and Rubber*. He was honored by Kenyon College with the degree of Doctor of Laws and by Mount Union College with the degree of Doctor of Business Administration.

Mr. Firestone was one of the famous quartet whose other members were John Burroughs, Thomas A. Edison, and Henry Ford, friends of long standing. Their annual vacation camping trips aroused widespread interest.

FISH. See ZOOLOGY.

FISK UNIVERSITY, a coeducational institution for colored people in Nashville, Tenn., founded in 1866. The total enrollment of 470 for the autumn of 1938 included 192 men and 278 women. The faculty numbered 55. The productive endowment for 1937-38 amounted to \$2,173,906, and the total income, \$411,878. The library contained 64,923 volumes. The total enrollment of 178 for the summer of 1938 included 67 men and 111 women. President, Thomas Elsa Jones, Ph.D.

FLAX. The flaxseed production in 1938 of 13 countries reporting to the International Institute of Agriculture was estimated at 95,654,000 bu. produced on 12,263,000 acres, respectively 2.1 per cent and 5.3 per cent below the average for the five years 1932-36. The yields of the leading countries, exclusive of the United States, were reported as follows: India 18,280,000 bu., Canada 1,359,000 bu., Lithuania 1,182,000 bu. (including hempseed), and Germany, not including Austria, 897,000 bu. For the crop year 1938-39 Argentina estimated its yield at 63,777,000 bu. In the five years 1932-36, the Soviet Republics yielded a yearly average of 29,213,000 bu.

According to reports by the U.S. Department of Agriculture, the 1938 flaxseed crop of the United States was estimated at 8,171,000 bu., produced

on 954,000 acres. The average yield per acre, 8.6 bu., was the highest since 1927 and above the 10-year average in each of the 11 reporting states except Michigan. The states leading in production and their yields were as follows: Minnesota 4,756,000 bu., North Dakota 1,490,000 bu., California 684,000 bu., South Dakota 382,000 bu., and Kansas 367,000 bu. These states produced over 90 per cent of the nation's crop. Minnesota and North Dakota led in acreage harvested with 453,000 and 298,000 acres respectively.

In the fiscal year ended June 30, 1938, the United States exported 232,000 tons of linseed cake, 17,000 tons of linseed meal, 821,000 lb. of linseed oil and imported 2000 tons of hackled and other flax, 10,880,000 lb. of linseed oil-cake and oil-meal, 17,218,000 lb. of flaxseed screenings, 17,861,000 bu. of flaxseed, and 243,000 lb. of linseed oil.

Eleven countries, not including the Soviet Republics, reporting flax-fiber production to the International Institute of Agriculture, produced in 1938 a total of 295,676,000 lb. on 716,000 acres. The production was 4.2 per cent under that of 1937 and 50.5 per cent above the average for the five years 1932-36, and the acreage 6.8 per cent under the area of 1937 and 45.7 per cent above the five-year average. The yields of the leading countries were reported as follows: Germany, not including Austria, 64,335,000 lb., Lithuania 57,786,000 lb. of flax and hemp fiber, Latvia 48,392,000 lb., and the Netherlands 37,602,000 lb. For the Soviet Republics an average production of 1,172,894,000 lb. for the five years 1932-36 is recorded. No fiber flax production was reported for any of the countries in North and South America.

FLOOD CONTROL. In June, Congress enacted a new flood-control law through which the Federal Government extends its claim to full control of all rivers in the United States, a claim first made in the Act of 1936. The right of the Federal Government to control navigable streams by virtue of the interstate commerce clause has long been recognized, but this right has been limited to the interests of navigation. The U.S. Bureau of Reclamation has carefully considered State rights and other earlier activities under the Water Power and even the TVA acts refer specifically to the Federal right to improve navigation. The new Act, however, departing from this precedent, asserts that the Federal Government cannot only undertake flood-control work on any river but also can take ownership of both the water and the power incidental to such works.

This new law seems to be a definite answer to the New England States which sought from Congress the authority to form an interstate compact in order that they might work out their own flood problems and have vigorously denied the authority of the Federal Government to take over the power rights incidental to flood works. At a meeting of the Connecticut Society of Engineers in Hartford in March, the rights of the States under the Constitution to form a compact and to control the water power developed were strongly defended. The newly elected governors in this area also stated that no TVA is wanted in the Connecticut River Valley. On August 1, however, President Roosevelt, writing to Governor Cross of Connecticut, stated:

I cannot approve any compact which deals with the water resources of the nation or their development. It is my profound conviction that these matters are properly the subject of Federal legislation and not of interstate compacts.

The deadlock continued to the end of the year, with the Federal Government refusing funds for flood works and the New England States determined to protect their State rights. In the meantime, the hurricane of September 21 led many to conclude that flood constructions cannot be indefinitely delayed. While the Connecticut River at Hartford reached a stage 2.2 ft. below that of the record flood of 1936, the Merrimack at Lowell was 8 ft. below the 1936 level and the New England area (excepting the shore of Long Island Sound where a high tide plus wind flooded roads, towns, and cities with a level about 10 ft. above that previously experienced) thus narrowly escaped a major flood disaster.

The work of the U.S. Engineers on the Merrimack River—in fact, all work in the Boston district, which includes New Hampshire, Massachusetts, and Connecticut—was shut down on December 23.

Muskingum. On July 1, the U.S. Army Engineers turned over to the Muskingum Conservancy District the completed flood-control works which will protect this valley from Marietta northward. Created by the Ohio legislature in 1933, and made possible by a PWA allotment of \$44,000,000, this project involved the construction of 14 dams plus various minor improvements.

Pittsburgh. Bids were opened on December 17 for the Crooked Creek Dam, first of a series of nine which will form part of the Pittsburgh Flood-Control project and, on the following day, for a second dam on the Allegheny, the Tionesta Dam.

Operation. Late in July a sudden flood on the Colorado River of Texas led to severe criticism of the operation of the Buchanan Dam—one of a series of four under the Lower Colorado River Authority. It was claimed that an abnormal amount of water had been held back of the dam for power-purposes and that storage was not available to properly reduce the flood flow. This experience was widely quoted by those who see grave dangers in these so-called, multi-purpose reservoirs and point out that the temptation is always present to over-emphasize power, because it is an income factor, and thus to neglect the basic purpose which is flood control.

Another flood on the Southern California Coastal plain, March 2-5, demonstrated the excellent functioning of the completed flood works on the Los Angeles River. Some 15 inches of rain fell in one day with a maximum of 11 inches in eight hours.

FLOOD CONTROL ACT. See UNITED STATES under *Congress*.

FLOODS. In general, the floods which occur when natural streams of inland regions overflow their banks may be grouped into two classes. One type is the local type over the land bordering a small stream, which is confined to a relatively small region; if the small region is not densely populated little damage is done, but if it is thickly settled great damage may be caused by a local flood. The other type is the flood over land bordering a large stream. Both classes of floods are caused by heavy rains (occasionally supplemented by melting snow). While there is no sharp line of demarcation between the two types of floods, it may be said that: (1) The average intensity of the rainfall over the drainage area which causes a local flood must be considerably greater than that causing a flood in a large stream, before much outside public interest is attracted to the local flood; (2) local floods are of short duration while floods in large streams may last weeks or months; (3) in the present state of the meteorological and hydrological sciences it is

impossible to predict the occurrence of local floods, while floods in large streams can usually be accurately predicted, and most governments maintain services for this purpose. A seacoast sometimes experiences a flood of a third class; such floods are not due to rains, but result from the so-called tidal waves caused by earthquakes or terrific windstorms.

The present year was an unusual one for floods in that the United States experienced the most damaging flood of the third class in its history. This was the flood which accompanied the tropical hurricane which passed over New England in September. While this was by far the worst disaster caused by a tidal wave in the history of the country when the property damage is considered, the loss of life was small as compared with the Galveston disaster of 1900.

Aside from the tidal flood in New England there were numerous other floods in the United States during the year, although if this exception be made, the year can not be regarded as an outstanding flood year. The most accurate statistics available show that during the 36 year period, 1902-37 inclusive, the average annual property loss caused by floods in rivers and small streams was \$58,000,000. Property damage due to tidal floods, such floods being usually most numerous on the coasts of the southeastern states, has not been included in this figure. This figure, \$58,000,000, even though it is based on the most accurate statistics available, is not only too small because of the exclusion of damage caused by tidal floods, but it is also too small due to the difficulty of obtaining accurate estimates of losses caused by floods in the small streams. The property damage for the present year is shown in the accompanying table and floods in rivers and small streams account for only \$52,675,123 damage. The damage caused along the New England Coast line by the tidal flood was \$150,000,000 and this sum has been omitted from the table so that it will be comparable with the corresponding table published for previous years in this YEAR BOOK. For the same reason the loss of life along the New England coast (488 lives) has been omitted from the table.

FLOOD LOSSES IN THE UNITED STATES IN 1938

Drainage Basin *	Reported losses ^b	Lives
St. Lawrence	\$ 237,350	..
Atlantic Slope ^c	25,896,825	..
Gulf (except Mississippi)	7,615,475	6
Mississippi (except Ohio)	9,385,638	63
Ohio	3,464,035	..
Pacific Slope	6,075,340	..
Total	\$52,675,123	69

* There were no losses reported in other Drainage Areas.

^b Probably about 75 per cent of actual.

^c Tidal flood in New England, September 21, omitted.

In the upper Sacramento Basin a period of heavy rain began near the end of January and continued throughout the first two weeks of February. A major flood resulted and affected all of the Sacramento-San Joaquin delta region. This was followed by another devastating flood in these rivers during March.

A disastrous flood occurred in the Rock River in Illinois during January and February. It was caused by heavy rain falling on frozen ground; ice gorges were formed which added to the destruction.

Important floods took place in the rivers of the East Gulf States during April. These floods were general but were most severe in the Coosa and

Alabama Rivers. Wetumpka, Alabama, on the Coosa River had the highest gauge reading since 1886. The maximum discharge at Montgomery for this flood equaled that for the 1929 flood (one of the highest of record here) but due either to a change in channel conditions or to unusual behavior of backwater, the crest discharge at Montgomery gave only a crest stage of 54.2 feet in this flood as compared with 56.9 feet for the same peak discharge in the 1929 flood.

Severe floods occurred during June in Kansas. There were four overflows in the Neosho River this month and one in the Smoky Hill River. The overflows in the Neosho did not approach previous records at any place but the duration was unusual. The flood along the upper Smoky Hill was one of the greatest ever known, generally speaking it was the greatest flood since 1903.

On the night of June 18-19 there was a sudden and disastrous flood in the Custer Creek near Miles City, Mont. Most of the time little or no water flows in this creek. On this night a severe storm took place when about five inches of rain fell in the short time of three hours. The wreck of the Chicago, Milwaukee, St. Paul, and Pacific Train No. 15 (*The Olympian*) occurred at the bridge over Custer Creek. Shortly after 10 p.m. a train crossed the bridge safely, and about 10:30 p.m. a track walker crossed it; at that time water was flowing in the creek but was well within the banks and did not appear at all dangerous. It kept rising, however, and evidently weakened the bridge to such an extent that when *The Olympian* came along about 12:40 a.m. it was not strong enough to support the locomotive which went down followed by seven cars, four remaining on the track. The water was deep enough that one car, a sleeper, was completely submerged. Forty-eight persons lost their lives and 64 others were injured.

In July there were damaging floods in the White River in Indiana and in the Missouri River. The Missouri River flood was most severe in and around Nebraska City but even here it was not an outstanding flood.

There was a very severe flood in the Colorado River of Texas from July 22 to August 3. It inundated portions of 12 counties. Rainfall was very heavy during the week July 18-25, over 21 inches being recorded at Sloan, Tex. Flood damage was both heavy and general along the banks of this river from Austin, Tex., to the Gulf.

On September 21, a tropical hurricane visited New England. An examination of records since 1788 indicates that this hurricane was not unprecedented (although hurricanes in New England are very infrequent) in violence in the New England area but the great increase in population and property values here since the early part of the 19th century accounts for economic losses in this hurricane being unprecedented. This hurricane caused damage in three different ways: First by its violent winds which blew down trees, houses, and telephone, telegraph, and electric transmission wires; second by the unusually high tidal wave which accompanied it and flooded the coast, and third by the torrential rains which caused all the small streams and rivers to overflow and flood inland areas along their banks. It is difficult to apportion accurately property damage among these three classes but the combined property damage caused by this hurricane makes it the worst in the history of the United States.

Considering first the tidal wave, along the shores of Long Island and New England, rises of water

caused by these hurricane winds exceeded all records at a number of points. Along the coast of Connecticut, Rhode Island, and on the shores of Narragansett and Buzzards Bays, the highest tide ranged from 12 to 25 feet above mean low water, being highest on the southern shores of Massachusetts. At the Point Judith Coast Guard Station the water rose 18 feet above mean low water, at Fairhaven, 25 feet; at Pocasset, 20 feet; at the Nobska Point Light Station, 15 feet. At Fall River the water came up rapidly in a great surge. Along the coast damage was naturally most severe in the large cities, Providence, R. I., and New London, Conn., suffering the worst. In both of these cities electric power failed for a few days. While property damage was most severe in these cities this was because there was more property to be damaged in them; the damage was general along the entire southern coast of New England.

Considering the damage caused by floods in the inland streams, most of the streams were already practically bankfull at the time the hurricane rains proper began. Over most of this area rain had been falling for about a week prior to the hurricane. The hurricane rains thus fell on wet ground with streams well above average stage. Along the Connecticut River near Hartford, Conn., and also at Springfield, Mass., flood damage was light compared to that in 1936. This was due to flood protection works erected since 1936. In the case of Hartford, however, credit for part of this achievement of saving property from flood damage goes to volunteer workmen and others who built a sandbag wall 4000 feet long and 5 feet high during the wet night of September 21 on top of the low section of the dike. At other places and on other streams flood damage was extensive and severe, although flood protection works along the Merrimack River proved their value.

In October there was a flood in the Upper Mississippi River extending from La Crosse, Wisc., to Louisiana, Mo. This flood did not do great property damage but it was very unusual in that floods in the Upper Mississippi River at this time of the year (in fact, except during the months of March to June inclusive) are very rare.

FLORIDA. Area and Population. Area, 58,666 square miles: included (1930) water, 3805 square miles. Population: Apr. 1, 1930 (census), 1,468,211; July 1, 1937 (Federal estimate), 1,670,000; 1920 (census), 968,470. Jacksonville had (1930) 129,549 inhabitants; Miami, 110,637; Tampa, 101,161; Tallahassee, the capital, 10,700.

Agriculture. Acreage, production, and value of the chief crops of Florida, for 1938 and 1937, appear in the accompanying table:

Crop	Year	Acreage	Prod. Bu.	Value
Oranges	1938	29,500,000 ^a	\$13,835,000
	1937	26,000,000 ^a	18,155,000
Grapefruit	1938	21,000,000 ^a	6,000,000
	1937	14,600,000 ^a	7,850,000
Corn	1938	805,000	8,452,000	4,902,000
	1937	789,000	7,890,000	5,996,000
Potatoes	1938	34,000	4,488,000	3,186,000
	1937	34,000	4,114,000	5,595,000
Tobacco	1938	19,200	19,392,000 ^b	5,211,000
	1937	19,600	16,786,000 ^b	4,388,000
Cotton	1938	85,000	25,000 ^c	1,150,000
	1937	118,000	40,000 ^c	1,736,000
Sweet potatoes .	1938	21,000	1,400,000	1,330,000
	1937	21,000	1,365,000	1,324,000

^a Boxes. ^b Pounds. ^c Bales.

Mineral Production. The mining of phosphate rock in Florida was exceptionally active in 1937. The yearly total of this product rose to 2,996,820

long tons (1937), from 2,624,900 (1936); by value, to \$9,142,985, from \$8,528,523.

Finance. Florida's State expenditures in the year ended June 30, 1937, as reported by the U.S. Bureau of the Census, were: For maintaining and operating governmental departments, \$41,177,733 (of which \$13,105,918 was for highways and \$11,888,885 was for local education); for capital outlay, \$8,112,581. Revenues were \$49,396,619. Of these, property taxes furnished \$2,312,051; sales taxes, \$25,466,305 (including tax on gasoline, \$21,413,102); departmental earnings, \$3,100,870; inheritance taxes, \$1,156,392; sale of licenses, \$13,498,944; Federal or other grants-in-aid, \$2,760,626. Funded debt was nil. On an assessed valuation of \$325,276,254, exclusive of intangible property and exempt value in homesteads, the State levied in the year ad-valorem taxes of \$814,534.

Education. Enrollments of pupils in the public schools of Florida in the academic year 1937-38 numbered 396,675; this comprised 261,211 in elementary studies (through the sixth grade), 134,645 in high schools (grades 7 to 12, inclusive), and 819 in kindergartens. The year's expenditures for public-school education included \$18,621,252 for current costs, \$2,503,441 for outlay, and \$4,758,885 for service of debt. There were 9549 teachers. Their salaries for the year averaged \$1002.80; by groups, \$1136.36 for white and \$569.49 for colored teachers.

Florida adopted a State constitutional amendment designed to assure sufficient State revenue toward support of public schools; a new school code went into effect; vocational training was augmented.

Political and Other Events. An automobile highway was built from the mainland to Key West on the structure of the abandoned Florida East Coast R.R. The enterprise was carried out by the Overseas Road and Toll Bridges District, aided by loans from the PWA. The railroad's line, which had cost about \$30,000,000, was purchased for \$640,000 in 1936, as the railroad company had found operation unprofitable in its later years and lacked money to rebuild. The route was to be operated as a toll road. For years after the hurricane of 1935, Key West had lacked connection with the rest of the Union by land.

The collection of a tax of one-half of 1 per cent on gross receipts, imposed by the State, was a subject of much protest among merchants. Georgia's quarantine against cattle and other live stock from Florida was somewhat modified in January. At Fernandina (January 14) was dedicated the first unit of a paper mill designed to cost \$9,000,000. The purpose of the undertaking was to produce white paper from Southern pine, in accordance with the researches of the chemist Charles W. Herty (q.v.), whose results had awakened anticipation of the growth of an important paper-making industry in the South, in addition to the already developed production of kraft paper.

Elections. Senator Claude Pepper (Dem.) was re-elected (November 8), and five Democrats were elected U.S. Representatives. Pepper had a Republican opponent, Thomas E. Swanson, but his election was a foregone conclusion. In the Democratic primary election (May 3) he won renomination with the aid of an indorsement from James Roosevelt, acting as spokesman for the President. Pepper's chief opponent in the primary, J. Mark Wilcox, was defeated by a heavy majority.

Officers. The chief officers of Florida, serving in 1938, were: Governor, Fred P. Cone (Dem.); Secretary of State, R. A. Gray; Attorney-General,

George Couper Gibbs; Comptroller, J. M. Lee; Treasurer, W. V. Knott; Commissioner of Agriculture, Nathan Mayo; Superintendent of Public Instruction, Colin English.

Judiciary. Supreme Court: Chief Justice, Glenn Terrell; Associate Justices, J. B. Whitfield, Rivers Buford, Armstead Brown, Roy Chapman, Elwyn Thomas.

FLORIDA, UNIVERSITY OF. A State institution of higher education for men, in Gainesville, Fla., established in 1853. In the fall of 1938 the registration totaled 3311; in the summer session of 1938 it was 2631. The faculty numbered 189. The endowment was \$288,347 and the instructional and operating cost was \$1,067,269. The library contained 140,884 volumes. The P. K. Yonge Laboratory School had an enrollment of 459 students. The General College, a two-year general curriculum for all entering students, had an enrollment of 1968 students. President, John James Tigert, LL.D.

FLORIDA STATE COLLEGE FOR WOMEN. An institution for the higher education of women in Tallahassee, Fla., founded in 1905. The enrollment for the first semester of 1938 was 1816, with a faculty of 161 members including five new positions. There were 870 enrolled in the 1938 summer session. The income from State appropriations was \$537,500, and from other sources \$92,699. The library contains 72,645 volumes. During the summer and fall of 1938 construction was begun on four new buildings on the campus, viz.: New dormitory, Student Union Building, Infirmary, and Dining Hall. Edward Conradi, Ph.D., is President.

FOOD, DRUG, AND COSMETIC ACT. See UNITED STATES under *Congress*.

FOOTBALL. See SPORTS.

FORDHAM UNIVERSITY. A Roman Catholic institution for higher education, under the Society of Jesus in New York City, founded as St. John's College in 1841. It is one of the largest Roman Catholic educational institutions in the country. The enrollment for 1938-39 was 7851, including 1452 in the School of Education and 842 in the Graduate School, and a distribution among the other colleges as follows: Law, 864; Fordham College (two divisions), 1780; School of Business, 528; Pharmacy, 143; Social Service, 460; Preparatory School, 456. The registration for the summer session 1938 was 1325. There were 404 faculty members. The endowment fund totaled \$685,260. There were 172,000 volumes in the library. On Sept. 1, 1938, the Teachers College became the School of Education of the University, in keeping with requirements of a re-organization plan calling for the merging of the programs of Teachers College and the Department of Education of the Graduate School so as to provide for (1) better integration and co-ordination of the teacher-training program, (2) control of undergraduate and graduate work in Education by one administration. President, the Rev. Robert I. Gannon, S.J.

FOREIGN RELATIONS. See UNITED STATES under *Administration*.

FORESTRY. Recovery from the doldrums of the recession marked the year 1938 in the field of commercial forestry. The year was in many ways the exact counterpart of 1937 when, after a promising beginning, all the gains were lost in the sharp slump in the latter half of the year. Perhaps the outstanding feature of the 1938 period was the increasing consciousness of the need of planned management of the nation's forests and forest

lands. President Roosevelt, in a special message to the Congress on March 14, stressed the intimate relationship between forest resources and the economic and social welfare of the nation. He emphasized the fact that some means must be found to make forest lands and forest resources contribute their full share to the economic welfare and stability of the nation and thereby to the security of the people. F. A. Silcox, Chief of the Forest Service, in his annual report to the Secretary of Agriculture, asserted strongly that the essential need is not more forest land in the United States but rather more and better forests on the lands already available. He pointed out that in the three centuries or more that have passed since the colonization of America by the white settlers the forests have been exploited with meager thought as to their renewal. Potentially that portion of the nation's forest lands, publicly or privately owned, that lies near population centers affords an immense work reservoir of special significance in times of economic stress. However, with some 630 millions of acres involved, the immensity of the task of developing and putting into action a constructive program becomes self-evident.

The Lumber Situation. A statement by the National Lumber Manufacturers' Association on December 28, to the effect that new orders booked in September, October, and November were 19 per cent above those of the comparable period in 1937, was indicative of a definite recovery from the recession. Orders for the entire year of 1938 were only 5 per cent less than in 1937. Demand for lumber for building was about equal in 1938 to that of 1937, due to gains in residential building in the last half of the year. Two important sources of demand, namely, exports and railroad purchasing, lagged considerably, with exports in 1938 the lowest in 16 years. The war in the Orient and disturbed conditions in Europe precluded any rapid recovery in the export lumber trade in the near future. Prices for lumber during 1938 were lower than in 1937. Using as an index 1926 prices as 100, the average for the first 10 months of 1938 was 90.4 as compared with 99 in 1937. There was, however, a moderate upward trend toward the close of the year.

The National Forests. Including slightly more than one million acres approved for purchase, the National Forest system as of June 30 comprised 175,238,168 acres. More than 1,280,000 feet of lumber were cut from the National Forests in 1938 under silvicultural practices that insured continuity of the stands. The National Forests provided a living for almost a million people and furnished recreational facilities that were enjoyed by 30 million citizens. These forests served as a refuge for most of the remaining big game animals, supplied forage for nearly seven millions of domestic livestock, and water for many cities and towns. The greatest value of the National Forest properties is not immediate monetary returns but rather in the preservation for future generations of productive forests which have always been such a potent factor in the national welfare and defense. Approximately 400 Civilian Conservation Corps camps were maintained on National Forest properties, serving at once two valuable purposes, notably the improvement of the forests and the improvement of the young men that comprised the personnel. More and more it is demonstrated that the nation's forests are a bulwark of strength and a necessary and integral part of the nation's welfare.

Forest Fires. November witnessed a series of calamitous brush and forest fires in Southern California, causing an estimated damage of five million dollars in property and denuded watersheds. Chief damage was in the Santa Monica and San Bernardino ranges. More than 10,000 acres were burned over on the mountains behind the city of San Bernardino, creating a serious flood-control problem.

Early October brush and forest fires on the Minnesota-Canada border took a toll of 17 lives, mostly members of settlers' families, whose homes were caught in the path of the rapidly spreading flames. Man and lightning ranked about equal as causes of fires on the National Forest areas in the year 1938. Chief Forester Silcox points out that there is little that can be done to prevent lightning-caused fires although much can be done to reduce the resulting damage by prompt suppression measures. Man-caused fires, on the other hand, could be greatly decreased or entirely eliminated by proper care. The CCC rendered material aid not only in direct fire fighting but in removing inflammable material along roads and trails and in constructing and maintaining roads, telephone lines, and lookout towers. Rarely has there been a more grievous problem of fire prevention than that which exists in New England following the hurricane of late September.

The New England Hurricane. According to an article by Prof. Robert T. Clapp of Yale University in the December number of the *Journal of Forestry*, the hurricane of September 21 caused a total loss in the New England States of between three and 4 billion board feet of timber. Most of the fallen timber was white pine, although in northern New Hampshire and Vermont much spruce and hardwood was destroyed. In Connecticut the loss was mostly hardwood. Salvaging operations sponsored by the Federal and State governments will save a considerable portion of the down timber but can not prevent tremendous losses. The fire hazard will be serious for several years despite active measures to open forest roads and to burn slash under safe conditions. The cost of slash disposal was considered prohibitive in the larger forest areas, leaving to Nature the task of removing the debris by decay, insect attack, and unavoidable fires, such as those caused by lightning. Incidental to the lumber loss will be the decreased maple-syrup crop for many years to come. The 40 CCC camps with their 8000 odd workers rendered important services in helping to clear away the debris and reduce the potential hazards.

Community Forests. According to a press notice issued by the U.S. Department of Agriculture on Jan. 9, 1939, more than 143 million trees have been planted on the 1500 community forests in the United States. Most of the planting has been done since 1910 by cities, counties, townships, villages, school districts, and other local governmental units which own small public forests for the production of timber crops, recreation, watershed protection, and various other purposes. Some of the community forests are being developed as an aid toward the reduction of local taxes. The Forest Service estimates that the eventual net returns from properly managed community forests may range from three to five dollars an acre annually.

New York has made a special effort to encourage community forests by supplying free trees to communities interested in developing such timber-producing areas, and reports that more than 70 million trees have been planted by county, township, city,

village, and school districts on formerly abandoned or idle land. Nine New York counties have planted from 2,000,000 to 3,500,000 trees each and cities which have planted from 500,000 to 3,000,000 or more trees include Middletown, Rochester, Little Falls, Glens Falls, Carthage, Oneonta, and Gloversville. New York City has planted more than 5,500,000 trees on its three watersheds. In Wisconsin about 32 million trees have been planted on 25 county forests and about a million trees have been set out in 149 school forests.

Massachusetts has planted more than 6,500,000 trees on its 102 town forests, and many additional thousands have been planted on the 75 watershed forests in that State. The Metropolitan Water District of Boston has planted more than 1,500,000 trees. Michigan has planted more than 5,800,000 trees on a variety of community forests, including school, watershed, and other types.

Pennsylvania has planted more than 5,000,000 trees on 134 community forests. New Hampshire has planted more than 2,000,000 trees on its 101 community forests, and Vermont has planted 3,000,000; New Jersey 3,000,000 and Connecticut about 4,000,000 trees. Washington reports the planting of more than 4,000,000 trees, largely on the Seattle city watershed. Georgia and North Carolina have each planted more than 1,000,000 trees and, to a lesser extent, other States have participated in the program.

Miscellany. The annual meeting of the Society of American Foresters was held at Columbus, Ohio, December 15-17, Dr. C. F. Korstian, President, in the chair. Among the prominent speakers were F. A. Silcox, Chief, U.S. Forest Service, G. H. Collingwood, Forester, American Forestry Association, and W. V. Garstka of the Soil Conservation Service.

Dr. John N. Spaeth, formerly associate professor of forestry at Cornell University, was named head of the newly created department of forestry at the University of Illinois.

Duke University, Durham, N. C., announced the opening in the autumn of 1938 of a graduate school of forestry under the leadership of Dr. Clarence F. Korstian. The new school offered work leading to the degrees of M.F. and Ph.D. The Duke Forest of nearly 5000 acres, located adjacent to the university was to be used as a field laboratory for investigations.

Willis M. Baker, formerly director of the Central States F.E.S. at Columbus, Ohio, was appointed, effective June 16, chief forester of the Tennessee Valley Authority with headquarters at Norris, Tenn.

The American Forestry Association, James G. K. McClure, Jr., President, held its 63d annual meeting at Old Point Comfort, Va., May 5-7.

The Olympic National Park, on the Olympic Peninsula, Washington, was established on June 29, when President Roosevelt signed the authorizing bill. The new park, including approximately 991 square miles, becomes the fourth largest national park, being only exceeded in size by the Yellowstone, Mt. McKinley, and Glacier Parks. Included within the new park are magnificent stands of virgin Douglas fir, spruce, hemlock, and cedar, the total merchantable timber being estimated at over 11 billion board feet. Included also are numerous glaciers and meadows covered with Alpine flowers, all of which contribute to make the new area one of the beauty spots of the nation.

Necrology. Dr. Charles H. Herty (q.v.), whose studies in paper pulp manufacture led to the de-

velopment of a tremendous industry in the Southern pines area, died July 27. The important research studies conducted under Dr. Herty's leadership will be continued by his associate, Dr. Charles H. Carpenter.

FORMOSA (TAIWAN). An island belonging to Japan. Area, 13,890 square miles including the 12 islands called the Pescadores (Boko-to) with an area of about 50 square miles. Population (1936 estimate), 5,310,000. The chief towns are: Taihoku, the capital (1935 population: 274,157), Tainan (1934: 109,887), Keelung (1934: 84,650), Takao (1934: 81,583), Kagi (1934: 70,083), Taichu (1934: 68,414), Schinchiku (1934: 54,110). On Mar. 31, 1935, the 1135 schools of all kinds had a total of 446,645 students.

Production and Trade. Production of chief crops, in 1936, in metric tons, was: Wheat, 500; barley, 500; maize, 1700; tobacco, 2200; tea, 10,800; sesame, 1400; soybeans, 4400; groundnuts, 54,900; jute, 9000. In 1937-38 the estimated production of rice was 1,713,600 metric tons; sugar cane, 1,175,000 metric tons. Mineral production, in metric tons, was: Coal, 1,744,000 (1936); salt, 225,000 (1936); copper ore, 4000 (1935 estimate); copper, 2600 (1937 estimate); silver, 6200 (1934); superphosphates of lime, 23,000 (1936). In 1936 it was estimated that 2650 kilograms of gold were produced. Livestock (Dec. 31, 1936): Buffaloes, 292,326; pigs, 1,813,049; cattle, 78,629; goats, 75,380; horses, 590. In 1937 the estimated value of general imports was \$54,000,000 (1936, \$52,000,000); exports, \$74,800,000 (1936, \$66,600,000).

Communications. There were, in 1937, some 10,740 miles of roads and almost all of them were surfaced with gravel. In 1933, 1863 vessels (4,038,256 tons) entered Formosan ports from Japan and other countries.

Government. The budget for 1938-39 was estimated to balance at ¥175,211,353 (yen averaged \$0.2845 for 1938). Formosa was ceded to Japan by China according to the treaty which was ratified on May 8, 1895, and on June 2 of that year Japan took formal possession. On Mar. 31, 1896, Japanese civil government in Formosa commenced. The government is under the administration of a Japanese governor-general. Governor-General, Seizo Kobayashi. See JAPAN under History.

FOUNDATIONS. Theory. The recently developed science of soil mechanics has continued to grow apace during the year, with engineering schools all over the country developing soils laboratories and the volume of research piling up year by year. Two schools of thought seem to have developed. There are those who claim the subject

is so involved and difficult that it must remain highly specialized and that the engineer in normal practice must go to the expert for the solution of his soils problems. There are others, however, who insist that soils problems today are being confused by the specialists and that, ultimately, this so-called science must be brought within the comprehension and scope of use of the profession at large.

Certain it is that there is still a wide gap to be spanned between much of the recent research and theory on the one hand, and the actual application of this new knowledge in practice and design on the other. The two major fields of application are in the design and construction of earth structures—levees, dams, embankments, etc.—and in the planning of foundation and of foundation methods. Apparently, progress in the application of modern theories has been more rapid in connection with the former where soil tests and methods of controlling construction have been devised. Further development in foundation work, in fact, seems to rest not only on the extension of laboratory procedure and theory but, perhaps primarily, on the accumulation of actual experience data—on the careful recording of behavior, settlement, etc., in various constructions over fairly long periods of time. Apparently it is only in this way that theory may be tempered to practice and the results of modern laboratory studies be fully evaluated and intelligently applied in design. Engineers have probably been remiss in not keeping continuous records of the behavior of many structures in the years following completion.

Practice. No distinctly new methods of foundation construction have developed during the year but older methods have been refined in detail and perfected in technique. For example, a remarkable piece of caisson work has been completed in constructing the piers for the Deer Island-Sedgwick suspension bridge in Maine (1080 ft. span). Two 28 by 60 ft. caissons were to be sunk in 50 to 75 ft. of water and were to rest on an irregular rock surface having a very thin cover of river drift. The caissons were "tailor-made," the lower edge being cut to fit the rock surface as indicated by careful soundings, and were dropped into place by a huge floating derrick. A perfect fit was secured in one case and, for the other, a small section of the edge had to be removed to fit an irregularity in the rock surface which was not revealed by the soundings.

Another remarkably accurate piece of work was accomplished in sinking an 82 ft. diam. circular caisson for the Cincinnati Gas and Power Co. It was necessary to bring this caisson as close to the desired grade at a depth of 70 ft. as possible. The huge tube was so carefully controlled in sinking that the deviation was only $\frac{1}{2}$ in.

Another notable application of the sand-island method, first used in sinking the piers of the Suisun Bay railroad bridge near San Francisco, is to be recorded in the construction of the new highway and railroad bridge over the Mississippi about 6 mi. above Baton Rouge, La. This bridge, a 5-span continuous-truss 3326 ft. in total length, requires two piers which will be carried 180 ft. below low water and one that is to reach 160 ft. Through the use of cofferdams formed of steel sheet piling and filled with sand, the "sand islands" were formed on which, and down through which, the shafts were sunk for the piers by the open dredging method. This identical plan was followed in the construction of the railroad bridge above New Orleans where a depth of 170 ft. was reached. The record for open dredging, however, is still held

by the Bay Bridge at San Francisco, where the suspension piers reached 230 ft. below the level of San Francisco Bay without the use of sand islands.

Unfortunately the work on the Baton Rouge piers has been much delayed, largely by difficulties in sinking the caissons. The piers are so light in section that there was, apparently, insufficient weight to overcome the frictional resistance between the sides of the caisson and the surrounding material. It is understood that this pier work, however, although long delayed, has at last been practically completed.

FRANCE. Area and Population. The area is 212,722 square miles. The population was estimated at 41,950,000 on June 30, 1937, as compared with 41,905,962 (domiciled) at the 1936 census. Foreigners resident in France in 1936 numbered 2,453,507 (including Italians, 887,732; Poles, 463,143; Spaniards, 410,183). Live births in 1937 numbered 616,863 (14.7 per 1000); deaths, 628,603 (15.0); marriages, 274,122 (6.6 per 1000). Populations of the chief cities at the 1936 census were: Paris proper, 2,829,746; Marseille, 914,232; Lyon, 570,622; Bordeaux, 258,348; Nice, 241,916; Toulouse, 213,220; Lille, 200,575; Nantes, 195,185; Strasbourg, 193,119; Saint-Etienne, 190,236; Le Havre, 164,083; Toulon, 150,310; Rouen, 122,832; Nancy, 121,310; Reims, 116,687; Roubaix, 107,105; Clermont-Ferrand, 101,128.

Religion and Education. With the exception of about 1,000,000 Protestants and a few thousand Jews, the French people profess the Roman Catholic faith. At the 1931 census there were 2,286,273 persons of five years or over (7 per cent of the total) unable to read or write. The school enrollment was: Elementary (Dec. 1, 1935), 5,260,534; secondary (1936-37), 253,583; higher public instruction (July 31, 1935), 82,218.

Agriculture. About 38 per cent of the working population is directly supported by agriculture, 31 per cent by industry, and 11.5 per cent by commerce. There were 51,955,000 acres of arable land (38.16 per cent of the total) in 1935. Yields of the chief cereals in 1938 (1937 figures in parentheses) were, in metric tons: Wheat, 9,120,000 (7,017,300); barley, 1,272,500 (1,016,600); rye, 804,300 (739,700); oats, 5,449,200 (4,346,600); corn (1937), 514,500. Output of other crops in 1937 was: Potatoes, 584,643,000 bu.; sugar beets, 8,666,000 metric tons; beet sugar (1937-38), 942,000 metric tons; wine, 1,357,236,000 gal.; olives, (1937-38), 83,775,000 lb.; olive oil (1937-38), 1,882,000 gal.; hay (sown), 11,792,000 metric tons; fodder beets, 32,170,000 metric tons; green forage, 11,635,000 metric tons. Livestock statistics for 1937 showed 15,755,000 cattle, 7,117,000 swine, 9,994,000 sheep, 1,447,000 goats, and 3,048,000 horses, mules, and asses.

Mining and Manufacturing. Mineral and metallurgical production in 1937 (preliminary) was, in metric tons: Coal and lignite, 45,333,000; coke, 7,802,000; briquets, 6,160,000; iron ore, 37,769,000; iron pyrites, 146,000; potash (K₂O content), 490,000; bauxite, 688,000; pig iron, 7,916,000; steel ingots and castings, 7,902,000; iron and steel (finished products), 5,318,000. The output of electric power in 1937 was 12,554,645,000 kilowatt-hours. The production of other leading manufactures in 1937 (preliminary) was: Silk (conditioned at Lyon), 4,363,000 lb.; wool (conditioned at Roubaix-Tourcoing and Mazamet), 196,130,000 lb.; cotton consumption, including waste, 640,635,000 lb.; rayon, 72,752,000 lb.; alcohol, 109,701,000 gal.; vessels launched, 25,000 gross tons. The chief

manufacturing lines, in order of the number of workers employed, were metal-working and machinery, textiles and textile working, foodstuffs, wood working.

Foreign Trade. Merchandise imports for consumption and exports of French products in 1936-38 and 1929 are shown in the accompanying table. The recent increases shown in the franc value of trade reflects successive declines in the foreign exchange value of the franc since September, 1936.

FRENCH FOREIGN TRADE

Year	Imports		Exports	
	Million francs	Million dollars *	Million francs	Million dollars *
1938	45,981	1,322	30,586	881
1937	42,316	1,683	23,935	952
1936	25,414	1,521	15,492	927
1929	58,221	2,282	50,139	1,965

* Conversions to dollars made at average yearly exchange rates.

The distribution of French trade by leading countries in 1936 and 1937 is shown in the accompanying table.

FRENCH TRADE BY COUNTRIES, 1936 AND 1937 [Millions of francs]

Country	Imports		Exports	
	1936	1937	1936	1937
Germany	1,771	3,247	667	1,415
United States	2,535	4,000	877	1,535
United Kingdom	1,798	3,380	1,912	2,721
Belgium	1,644	3,057	1,857	3,145
Netherlands	579	1,056	459	832
Switzerland	577	813	972	1,446

The value of the leading 1937 imports was (in current U.S. dollars): Bituminous coal, \$129,449,000; wines, \$95,108,000; oilseeds, \$92,781,000; raw cotton, \$82,998,000; wool, in bulk, \$72,921,000; machinery, \$67,028,000. The value of the chief exports was: Wool, all sorts, \$67,355,000; chemicals, dyes, etc., \$64,253,000; cotton fabrics, \$42,425,000; machinery, \$36,820,000; iron ore, \$30,906,000; wine, \$28,786,000.

Finance. Gross general budget receipts and expenditures for the calendar years 1935 through 1938 are shown in the accompanying table from the *Statistical Year-Book of the League of Nations, 1937-38*. The figures exclude transactions of the Amortization Fund, special services of the Treasury, and other special funds including defense and other appropriations of 6,265,100,000 francs in 1936, 16,025,700,000 in 1937, and 14,231,500,000 in 1938.

FRENCH BUDGETS, 1935-38

[In millions of francs]

Year	Receipts	Expenditures	Surplus (+) or deficit (-)
1935	39,485.3	49,868.1	-10,382.8
1936 *	40,449.9	40,306.8	+ 143.1
1937 *	43,481.9	48,281.2	- 4,799.3
1938 *	54,776.2	54,739.1	+ 37.1

* Estimates.

The budget for 1939 estimated ordinary receipts at 66,388,068,027 and ordinary expenditures at 66,564,624,059 francs. The 1939 extraordinary, or capital, budget for defense needs, to be met mainly by borrowing, was estimated at the beginning of 1939, with some entries incomplete, at 27,034,014,000 francs (14,201,490,000 at the beginning of 1938). Seven annex budgets, regarded as self-liquidating, were balanced for 1939 at 10,714,471,204 francs and for 1938 at 9,200,333,566 francs. Included among these, as the largest account, was the post, telephones, and telegraphs budget of 6,815,874,903 francs for 1939. Actual budget receipts in

1938 were 51,703,978,000 francs, excluding special budgets (41,741,595,000 in 1937).

The internal debt on Sept. 30, 1937, was 384,849,000,000 francs. The external debt was estimated at 7,476,000,000 francs on July 31, 1936. Service of the debt in 1938 required 13,811,000,000 francs. The average exchange rate of the franc was \$0.0611 in 1936, \$0.0405 in 1937, and \$0.0288 in 1938.

Transportation. The railway network comprises 7 large systems, 2 under state ownership and 5 privately owned but state operated. The total length of line in 1937 was 26,528 miles; passengers carried, 627,473,000; freight carried, 246,836,000 metric tons; gross receipts, 12,630,000,000 francs (14,865,018,000 francs in 1938). Roads and highways aggregated 393,761 miles in 1937; navigable rivers, 3800 miles; canals, 3300 miles. The number of automobiles in operation Jan. 1, 1938, was 2,192,471. The water-borne internal traffic in 1937 totaled 47,115,000 metric tons. Air France, the principal air line, carried 90,000 passengers (including crews) and 1,984,140 lb. of express freight in 1937. Its route from Marseille to Hanoi, French Indo-China, was extended to Hong Kong on Aug. 4, 1938. A total of 27,429 vessels of 54,746,000 net register tons capacity entered French ports in the foreign trade during 1937. The leading ports, in order of traffic handled, were Marseille, Le Havre, Cherbourg, Rouen, Dunkirk, Bordeaux, and Boulogne.

Government. The Constitution of 1875 vests executive power in the President, acting through a ministry selected by him but responsible to Parliament. Legislative power rests in the Chamber of Deputies and the Senate, the members of which jointly elect the President for seven years. The Senate has an authorized membership of 314, all 40 years or more of age and chosen by an electoral college for terms of nine years. The Chamber has an authorized membership of 618, elected by direct manhood suffrage for four years. Premier at the beginning of 1938, Camille Chautemps (Radical Socialist), heading a Popular Front ministry of Radical Socialists and Socialists which enjoyed Communist support. For changes in 1938, see *History*.

HISTORY

Domestic Affairs. The fatal cycle of financial and economic convulsions, cabinet crises, and social conflicts continued its course throughout 1938. It brought France deep humiliations and tragic setbacks in the international field and caused the collapse of the Popular Front, which had ruled France since the 1936 parliamentary elections. In search of national security and prosperity, the nation turned gradually toward a greater degree of executive government under conservative direction, arousing fears of dictatorship.

The Fall of Chautemps. The situation in France at the beginning of 1938 resembled that in the United States in many respects. The sweeping Popular Front social and economic reforms (see 1936 and 1937 YEAR BOOKS) had been followed by a "breathing spell" designed to give business an opportunity to recover of its own initiative. But the distrust between business and government hampered the economic revival. Moreover, France's reserves of wealth and credit were insufficient to meet the costs of the reforms and at the same time to finance the intensive rearmament needed to match Germany's tremendous armament program. Capital, handicapped by higher costs and a smaller turnover, demanded modification or repeal of the

reforms. Labor, on the other hand, agitated for higher pay to meet the rapidly increasing cost of living. In December, 1937, and January a recrudescence of strikes served to lower production and widen the rift within the Popular Front between the conservative wing, represented by the Radical Socialists, and the more radical Socialists and Communists.

With capital once more leaving the country owing to industrial unrest and the Treasury compelled to borrow five billion francs from the Bank of France to meet its current expenses, conservatives within and without the government insisted that Premier Chautemps break with the Communists and take representatives of the Center parties into his cabinet in order to restore business confidence. The Socialists and Communists demanded more social reforms and the establishment of exchange control to prevent capitalists from "sabotaging" the Popular Front by exporting their funds. This basic conflict led the Communists to withdraw parliamentary support of the cabinet. The Socialists then withdrew from the government and Premier Chautemps was forced to resign on January 14.

After the Socialist former Premier, Léon Blum, and Georges Bonnet, conservative Radical Socialist Finance Minister in the Chautemps Cabinet, had both failed in efforts to form a new government, President Lebrun again entrusted Chautemps with the Premiership. On January 18 he formed a new ministry composed of Radical Socialists with the exception of a few members of small allied groups. Although the new government controlled only 166 out of 618 seats in the Chamber, it won a vote of confidence by 502 to 1 on January 19. Chautemps then undertook to solve the pressing problems raised by the capital-labor conflict through enactment of a modern labor code.

The first of six labor bills, including provision for adjustment of wages to variations in living costs, was passed on March 4 over the strong opposition of conservatives in the Senate. Meanwhile, the government had co-ordinated the military, naval, and air forces under a single political and a single military chief—Édouard Daladier, Minister of National Defense, and Gen. Marie Gustav Gamelin, respectively. It adopted a fairly strong foreign policy based on support of Czecho-Slovakia and adherence to the Franco-Soviet mutual assistance pact. Like all of its immediate predecessors, the government also sought to obtain from Parliament extraordinary decree powers to prevent the ever-threatened financial collapse. But the Socialists and Communists refused to approve the decree powers, fearing Chautemps would use them to abolish the Popular Front social and economic reforms. Consequently, the Chautemps Government resigned on March 10 before the remainder of the labor bills could be enacted.

The Blum Government. While the French parliamentarians maneuvered to find a new head for their leaderless government, Hitler seized the opportunity to annex Austria (q.v.) on March 12-13. On March 13 Léon Blum succeeded in forming a new Popular Front ministry of Socialists and Radical Socialists supported by the Communists. Despite the growing threat across the Rhine, the Center parties refused his invitation to form a Left-Center cabinet of national union. Blum took over the Finance portfolio and retained Daladier as Minister of National Defense. For the first time a Minister of Propaganda was added to the cabinet to counteract German and Italian propagandist activities.

Blum's return to the Premiership was the signal for a new wave of strikes and lockouts. French aircraft and armament industries were virtually paralyzed at a time when the country's production of war materials had already fallen far behind that of the totalitarian states. The Treasury was empty, as usual, and when Blum sought to raise the limit on advances from the Bank of France to the government by the sum of nine billion francs, the conservative Senate reduced the increase to five billions.

Aware that his ministry was doomed, Blum advanced a comprehensive plan for the economic and financial rehabilitation of France through abandonment of a liberal economic regime in favor of a partially controlled economy organized on a "semi-war basis." The plan called for a capital levy, suspension of amortization of the public debt, a camouflaged form of exchange control, revaluation of the Bank of France's gold reserves, increased taxes, modification of the 40-hour-week law to permit increased production in the armament industries, price control, an old-age pension system, etc. When Blum asked Parliament for decree powers to put this program into effect, the Chamber granted the request on April 6, 311 to 250, with part of the Radical Socialists voting in opposition. In the Senate, however, the Premier suffered a crushing defeat on April 8, 223 to 49, and his government collapsed.

Daladier Ministry. The formation of a new government on April 10 by Édouard Daladier marked the final collapse of the Popular Front. Daladier belonged to the conservative wing of the Radical Socialist party. He had been forced to resign as Premier following the great February (1934) riots in Paris but had regained popularity through his able services as Minister of War and National Defense in the four successive Popular Front governments. He now formed a government of Radical Socialists and representatives of several Center parties and elaborated a program calling for increased industrial production, a balanced budget, and the encouragement of expatriated capital to return by affording opportunities for profitable investment and a stable monetary unit.

Daladier easily obtained from Parliament the decree powers that had been denied Blum and on May 3 issued the first of a series of decrees designed to achieve his objectives. These included a flat 8 per cent increase in all state taxes; tax remissions to companies modernizing or expanding their plants; reduction of railway fares and gasoline prices to tourists; and revision of the 40-hour week to permit overtime work. On May 4 the franc was devalued for the third time since September, 1936. This time a new minimum parity of 179 francs to the pound sterling, or 35.8 francs to the dollar, was established. Devaluation brought much hoarded money back into circulation and a repatriation of capital from abroad.

A second series of decrees issued May 25 provided mainly for additional spending to stimulate recovery. A three-year public works program costing 11 billion francs was launched, the work to include ports, waterways, aviation fields, highways, hospitals, schools, water-supply projects, housing, and slum clearance. Other decrees extended easier credits to business and changed the base of the 40-hour-week laws from 50 weeks annually of 40 hours each to 2000 hours annually, thus benefiting seasonal industries.

Effect of Czech Crisis. Daladier's policy was based upon a return of business confidence that

would permit a rise in production and a revival of foreign trade. Some progress was made in this direction as a result of the above decrees, but the European crisis over Czecho-Slovakia in September proved a severe setback to the Premier's domestic program. The immediate cost of mobilization and other preparedness measures during September amounted to some 10 billion francs, practically all of which had to be borrowed from the Bank of France. Moreover, the growing danger of war dissipated much of the business confidence engendered by the Daladier decrees.

After Munich, France faced the necessity for further drastic sacrifices and the curtailment of economic freedom in order to speed up rearmament sufficiently to catch up with Germany and Italy. The great issue before the government and country was how to apportion these sacrifices among the various classes. Angered because Daladier and Foreign Minister Bonnet had virtually abrogated the Franco-Soviet alliance during the September crisis, the Communists deserted their Popular Front associates in Parliament on October 4 and voted against the government's foreign policy. The next day they voted to reject Daladier's request for an extension of his decree powers until November 15. The Socialists abstained from voting while the Radical Socialists and conservative parties voted to grant the Premier's request.

The Struggle with Labor. The labor organizations allied with the Popular Front notified Daladier that they were unwilling to accept further sacrifices unless capital bore its share of the burden. Yet the government's whole program rested upon the retention and strengthening of business confidence. Rather than sacrifice that program, Daladier and his associates decided to cut loose completely from their more radical Popular Front allies. They were encouraged to adopt this course by a swing to the Right in the Senatorial elections of October 23.

A significant reshuffling of the cabinet took place on November 1 when Paul Reynaud, a conservative financier, replaced Paul Marchandeau as Minister of Finance. He formulated another recovery program that was launched by means of a series of decrees issued November 13. The gold stock of the Bank of France was revalued at the rate of 170 francs to the pound sterling, yielding a "profit" of 31.5 billion francs which was used to repay most of the inflationary advances made to the Treasury by the Bank of France in preceding months. The 40-hour week was further emasculated. Employers were authorized to increase working hours as much as 10 hours weekly provided they paid slightly higher hourly wages and a 10 per cent tax on profits earned by such extra work. Other decrees raised postal and telephone rates, transit fares in Paris, taxes on coffee, gasoline, tobacco, sugar, and wine, and taxes on income and factory production. At the same time a special committee was created to weed out superfluous civil servants. Increased working hours permitted the transfer of 40,000 workers from the railways to national-defense industries. Public works projects of non-military value were abandoned to permit concentration on rearmament. As partial compensation to the workers, M. Reynaud promised that a system of old-age pensions would be established. On November 14 the national lottery established five years before was suppressed.

General Strike Broken. These decrees caused much uneasiness among various political groups, including some of Daladier's Radical Socialists,

but were most bitterly denounced by the Communists, Socialists, and the General Confederation of Labor. The radicals declared the decrees largely negated the 1936 social reforms without imposing commensurate sacrifices upon capital. The Communists sought to exploit this general resentment to force the resignation of the government. Communist-led demonstrations against the decrees broke out in Paris on November 17 and sit-down strikes began to spread through the armament and other industries. The Socialists likewise organized protest demonstrations, though not for revolutionary purposes.

The Daladier Government took firm measures to end the sit-downs, ejecting the strikers from occupied factories and fining and imprisoning the ringleaders. On November 22 the General Confederation of Labor called a 24-hour general strike for November 30 in protest against the Daladier decrees and the measures taken against strikers. Premier Daladier declared the general strike was an illegal political weapon aimed at the government. On November 26 he requisitioned all the principal railways and other public services for military purposes, thus subjecting all strikers operating these services to discipline by court-martial. Cabinet officials also addressed radio appeals to the country to aid in upholding the government and foiling Communist maneuvers.

In the face of the government's determination, the strike proved a failure. Most of the employees of the railways and public services remained at work, except for the crews of some of the big French Line ships. Between 25 and 50 per cent of the workers in private industries walked out but returned to work quickly. There were minor strike disorders in eight cities. But many strike leaders were arrested, striking ship crews were replaced temporarily by men from the navy, and by December 10 the general strike was liquidated.

Daladier Faces Parliament. As soon as it was evident that the strike was a failure, the Premier called Parliament into session on December 8 to pass upon his policies. On December 10 he won a vote of confidence in the Chamber of Deputies, 315 to 241. The Socialists for the first time joined the Communists in voting solidly against the government, thus testifying to the complete disintegration of the Popular Front. Daladier's support came from the Radical Socialists, the Center, and the Right. In the ensuing debates on the budget and the government's economic and foreign policies, however, Daladier had several narrow escapes. His majority was cut to three in a vote of confidence taken on December 22.

Meanwhile the government's conservative tendencies had greatly aided business confidence and speeded the return of capital that had fled abroad. The substantial improvement in the economic situation enabled Finance Minister Reynaud to refund foreign obligations of the French railways, amounting to 3,500,000,000 francs, at a lower interest rate on December 27. The 1939 budget (see *Finance*) showed a substantial improvement in the general financial situation.

Other Internal Events. Armament expenditures increased from 11.4 to 26 billion francs between 1934 and 1938, and a further expansion was provided for in the 1939 budget. Yet French armaments lagged behind those of Germany, particularly in the air. In 1933 the French had the most powerful air force in Europe; in 1938 it was rated a poor fifth. A substantial part of the 1938 defense expenditures went into the modernizing and ex-

pansion of military aircraft plants. A program was adopted calling for 5000 modern planes to cost 16 billion francs, but the average monthly output in 1937 was only 38 planes and at the end of 1938 only 62. However, the Air Minister on November 30 promised the Chamber of Deputies that production would reach 200 planes monthly early in 1939. Large-scale rebuilding of the merchant marine as a national economy and defense measure was started under the decrees of May 2.

French concern over national defenses was increased by the development in Alsace of an agitation for autonomy, sponsored in part by Nazi propaganda. Some French officials feared that the Maginot line might not prove impregnable to a German attack if Nazi elements among the Alsations aided the invaders. The partition of Czechoslovakia on the ground of "self determination" also encouraged the relatively unimportant autonomist agitation in Brittany. Thousands of additional refugees from Austria, Germany, Spain, and Czechoslovakia poured into France during 1938, adding to the problems caused by the already large alien influx since the World War. On December 2 the government notified the Inter-Governmental Committee on Refugees that it would find room for 10,000 refugees in its colonial empire. But it was estimated that there were more than 200,000 recent political exiles in France at that time, and the government was considering steps to prevent a further influx.

Foreign Relations. Between 1933, when Hitler assumed power in Germany, and the beginning of 1938 French security and political influence in Europe had been progressively shattered by the hammer blows of Nazi diplomacy backed by armed force (see 1937 YEAR BOOK, pp. 260 f.). In 1938 this process was accelerated. The French diplomatic retreat became a rout. Reaping the bitter fruits of weak leadership and national disunity, France saw herself isolated in Western Europe. The great chain of alliances with which she had ringed Germany was almost completely broken. The only comfort France garnered from this debacle was that growing fear of Germany welded the Anglo-French understanding of 1936 into a hard and fast military alliance.

Czecho-Slovakia Abandoned. Rendered leaderless by one of its periodical cabinet crises, France stood helplessly by while Hitler annexed Austria on March 12-13, thus nullifying another provision of the World War peace treaties and removing another prop to the French security system. The collapse of Austria greatly weakened Czechoslovakia, France's most faithful ally in Central Europe, and exposed the Prague Government to the full force of the German diplomatic offensive. Aware that a crisis over Czechoslovakia was approaching, successive French Premiers and Foreign Ministers gave Prague repeated assurances that they would fulfill their treaty obligation to aid Czechoslovakia against an unprovoked German attack. But when the crisis came to a head in September, the Daladier Government yielded to defeatist elements in the Cabinet and country led by Foreign Minister Georges Bonnet and to pressure from both London and Berlin. On the morning of September 21 the French Minister in Prague notified President Beneš that if Czechoslovakia refused to cede her Sudeten districts to Germany and war resulted, France would repudiate her treaty obligations. The result was the capitulation of Czechoslovakia and its ensuing transformation from a strong ally of France, commanding 30 di-

visions of highly trained and well-equipped troops, to a helpless vassal of Germany. See CZECHOSLOVAKIA under *History*.

Alliances Weakened. The dissolution of the Franco-Czech alliance nullified or greatly weakened the French alliance with Poland, the mutual assistance pact with the Soviet Union, and understandings with Rumania and Yugoslavia. After Munich none of the latter governments could count on French aid against Germany or Italy unless France herself was directly threatened with attack. With the breakup of the Popular Front in France and Premier Daladier's open break with the French Communist party, Franco-Soviet relations became progressively worse. On October 4 a Moscow journal reflecting the views of the Soviet Foreign Office declared that France "no longer has an ally in Europe except Britain." And on November 26 the Soviet Ambassador at Paris warned Foreign Minister Bonnet that if Daladier outlawed the French Communist party the Soviet Union would withdraw completely from its mutual assistance treaty. In November, King Carol went to Paris seeking French aid against the Nazi threat to Rumania, but received no encouragement or support. Yugoslavia had long before drifted out of the French orbit toward an understanding with Germany and Italy.

Post-Munich Relations with Germany. After Munich the Daladier Government frankly admitted the collapse of the long-term French foreign policy based upon the League of Nations and the eastern European alliances. It abandoned the contest with Germany for European hegemony and turned to the defense of French national security through increased emphasis on the development of the colonial empire and the maintenance of communications between the empire and the mother country.

In return for French acquiescence in Germany's domination of central and eastern Europe, Foreign Minister Bonnet obtained from the Reich a pledge to "recognize as definitive" the existing Franco-German frontier. This was the sole concrete stipulation in a vague declaration of amity signed in Paris on December 6 by the French and German Foreign Ministers. The declaration also stated that "no question of a territorial order remains in suspense" between the two countries, leading some observers to conclude that Hitler had agreed not to press his colonial claims against France so long as the French gave him a free hand in eastern Europe. The Daladier Government had previously declared that it would energetically reject all claims of a territorial type and limit negotiations regarding colonies exclusively to a study of fair redistribution of raw materials. German official sources, however, continued to demand the return of all colonies lost in the World War. Moreover, the French people as a whole placed no faith in Hitler's frontier pledge, remembering that in *Mein Kampf* he had described France as the "eternal enemy" that must be crushed.

Friction with Italy. The French Government's plan to cut its losses in eastern Europe and fall back upon the empire encountered formidable obstacles. Nationalist agitations were assuming serious proportions in North Africa, Syria, and French Indo-China. Even if these movements could not hope to win immediate independence from France they could greatly hinder the peaceful and profitable exploitation of colonial resources (see ALGERIA, MOROCCO, SYRIA, and TUNISIA under *History*). Moreover, the colonial empire and French

communications thereto were increasingly threatened by Italian expansion in the Mediterranean and particularly by the Italian intervention on the side of the Insurgents in Spain.

Friction between France and Italy over the Spanish situation grew steadily worse during the year, impeding British efforts to effect a Franco-Italian reconciliation. The progress of the Spanish Insurgent armies resulting from Italian and German military aid confronted France with the danger of a German-Italian-Spanish alliance, exposing her to attack from three sides. The Italian and German military, naval, and air forces in the Balearic Islands and on the Spanish mainland were in a position to hinder or sever French communications with North Africa in case of a European war. But despite this danger and the failure of the non-intervention agreement to end Italo-German aid to the Insurgents, the French took no measures to aid the hard-pressed Loyalists except for the opening of the frontier from March until June to permit the Loyalists to import arms and munitions. The closing of the border by the Daladier Government in June appeared to seal the fate of the Loyalists. During the subsequent Czecho-Slovak war crisis, General Franco, the Insurgent leader, announced that he would remain neutral.

Italo-French negotiations for a general settlement came to a standstill after Mussolini on May 14 declared that the French and Italians were on "opposite sides of the barricades" in the Spanish struggle. After the Munich accord, however, France decided to recognize Italy's conquest of Ethiopia and appointed an Ambassador to Rome to renew negotiations. Mussolini, however, placed a high price upon his friendship, namely, the cession by France to Italy of the port of Djibouti in French Somaliland and the Djibouti-Addis Ababa railway as well as an Italian share in the control of the Suez Canal and the administration of Tunisia. He also demanded French recognition of General Franco's status as a belligerent.

Mussolini took advantage of the French general strike movement in November to press his demands. A demonstration demanding Tunisia, Corsica, Nice, and Savoy was staged in the Italian Chamber of Deputies on November 30 and supported by a vigorous press campaign. This aroused counter-demonstrations against Italy in Corsica and Tunisia. Premier Daladier and Foreign Minister Bonnet made separate declarations that France would not cede an inch of territory beyond that mentioned in the Italo-French agreement of 1935 (see 1935 YEAR BOOK, p. 344). This stand was affirmed in a note of December 26 to Italy. Small military and naval reinforcements were sent to Djibouti and the Tunisia defenses were strengthened. In the middle of December the Italian Government announced that it no longer considered the 1935 agreement valid; it had never been ratified. The year end found Mussolini still standing behind his claims, Premier Daladier preparing for an inspection of the Corsican and Tunisian defenses, and relations between the two countries in an extreme state of tension. See map under ITALY.

The Anglo-French Alliance. Following Hitler's military occupation of the demilitarized Rhineland zone in March, 1936, the British had persuaded France to acquiesce in this violation of the Versailles Treaty in return for a British pledge to defend France against an unprovoked German attack. Consultations between the French and British general staffs were agreed upon. Thus understanding was broadened into a military alli-

ance in the Anglo-French conversations in London on Apr. 28-29, 1938. They agreed to unify all their armed forces in case of another European conflict, with a French general commanding their combined armies, a British admiral directing the navies, and a British officer controlling the air forces. Joint economic measures were agreed upon in preparation for a possible conflict. They were to pool their purchases of war materials and supplies and to accumulate joint reserve stores of war materials, ammunition, and oil in France. In return for the British alliance, France agreed to follow the British lead in permitting Franco to win in Spain with German and Italian aid, in recognizing Italy's Ethiopian conquest, and seeking a settlement with Italy.

Later British pressure aided the defeatist elements in France in bringing about the repudiation of the Czecho-Slovak alliance and the French withdrawal from central and eastern Europe. The alliance was solidified by the visit of the British sovereigns to France on July 19-21. On November 23-25 further Anglo-French conversations were held in Paris, with both Premiers and Foreign Ministers participating. They agreed to coordinate and increase their armaments. However, the many setbacks to Prime Minister Chamberlain's appeasement policy, accompanied by the progressive deterioration of the French security system, led many Frenchmen to wonder if they were not paying too high a price for the British alliance.

British co-operation proved valuable in the Far East, however, where a joint Anglo-French warning served, temporarily at least, to avert the projected Japanese occupation of Hainan Island, threatening French Indo-China (q.v.). On July 3 the French position in the eastern Mediterranean was safeguarded by an agreement with Turkey concerning the Sanjak of Alexandretta in Syria (q.v.) and paving the way, it was believed, for joint Franco-Turkish co-operation in the event of a European war. Meanwhile the French Government had decided not to ratify the 1936 treaties granting independence to Syria and Lebanon. Preparations were being made at the year end for sending a mission to Syria to arrange a new agreement that would better safeguard French imperial interests in that region.

See ALGERIA, AUSTRIA, BELGIUM, CHINA, CZECHO-SLOVAKIA, GERMANY, GREAT BRITAIN, ITALY, MOROCCO, POLAND, RUMANIA, SPAIN, SYRIA, TUNISIA, TURKEY, and YUGOSLAVIA under *History*; LITTLE ENTENTE, MILITARY PROGRESS, NAVAL PROGRESS, REPARATIONS AND WAR DEBTS, STRIKES AND LOCKOUTS.

FREE CHURCH FELLOWSHIP, THE. A co-operative movement of liberal churches and individuals, first organized in 1933 under the name of the Free Church of America. The name was changed to the Free Church Fellowship as more accurately describing an enterprise which is not a new denomination or an organic merger of existing denominations but a liberal federation of churches and individuals.

The principles of the Free Church Fellowship are stated as follows:

1. We believe that Religion is ethical, that ethics is social, and that the church is the organized conscience of society.
2. We conceive our task to be: First, the cultivation of excellence, the promotion of character, the encouragement of the individual in his endeavor to realize, through all his relationships, the principles of integrity and honor; and second, the uniting of individuals and churches for the upbuilding of human welfare.
3. We propose that the Free Church Fellowship shall be

a union of religious liberals, a home for the emancipated spirit of man, whatever the forms of religious faith and worship.

The American Unitarian Association and the Universalist General Convention are the only denominational members of the Fellowship, but individual Methodist, Community, Federated, and Independent Churches belong, and individuals from other denominations are included in the Council and the Roll of Fellows. By virtue of denominational membership, all Unitarian and Universalist churches become members of the Fellowship by their own vote. All other churches become members by the vote of the Council of the Fellowship, and individuals by the vote of the Council or the Executive Committee.

The President is the Rev. John Howland Lathrop, D.D., of Brooklyn, N. Y., and the secretary is the Rev. Max Kapp, 150 Clinton St. S., Rochester, N. Y. The headquarters of the Free Church Fellowship are at 16 and 25 Beacon Street, Boston, Mass.

FREEMASONRY "is not so much form and ritual as a way of life and a challenge to service. It is a social philosophy and a call to fraternal living," said the retiring Grand Master, S. C. Klinck, addressing over 5000 Masons, representing New York State's 1037 lodges, on May 3, at which D. C. Beard, a founder of the Boy Scouts, received the Grand Master's medal. The Grand Lodge of Parahiba, Brazil, announcing, on June 13, its resumption of labor, after suppression, quotes from its constitution's preamble: "Masonry in essence is an universal institution whose fundamentals are—love of God, humanity, country, and family."

Activities. Architectural. Ground was broken on November 14 for the new Scottish Rite Temple in Washington City. The site on 16th St. adjoins the Mormon chapel lot. Commencement of a new Masonic Hall in Glasgow in 1939, to cost £100,000, is planned.

Cornerstones have been laid Masonically for two centuries. Among those in 1938 were:

On March 26, for the new Scottish Rite Temple in Manila, by the Philippine Grand Lodge (a notable occasion, witnessed by a large concourse, including High Com. McNutt and Maj. Gen. McArthur, the principal address being given by Jno. W. Hausermann, leading American of the islands); on May 18, for the new Hall of Government of George Washington University, at the nation's capital, by the Grand Lodge of the District of Columbia; on July 16, for St. Oswald's church, Coney, Gloucester (Eng.), by the Provincial Grand Master; on the same date, for Cay Maternity Home, Leamington (Eng.), by the Warwickshire Provincial Grand Master (both of these were "foundation stones"); on August 6, for the new Post Office at Shelton, Wash., by the State's Grand Lodge; on September 17, for the new grade school building at Crown Point, Ind., by the State's Grand Lodge; on September 28, for the 12th Shriners' Crippled Children's Hospital at Spokane, Wash., by the State's Grand Lodge.

Dedications. Among these may be mentioned: On July 11, by the N.C. Grand Council of Royal & Select Masters, the dedication of a Masonic Shrine and Monument, built of 300 stones from many countries, at Black Camp Gap, on the edge of Great Smoky Mt. Park; on July 24, the dedication of the Masonic Hall on an elevation overlooking Nairobi, Kenya, attended by many from various parts of East Africa; on October 1, the dedication of the \$250,000 Scottish Rite Temple at Fresno, Calif.; on October 11, the dedication of the \$110,000 Masonic Temple at Charlotte, N. C.; on October 14, the dedication of the Shrine "Mosque" at Peoria, Ill., and on November 19, that of the Scottish Rite Temple at Manila, P. I.

THE GENERAL STRIKE

A group of Mobile Guards in Toulouse entirely surrounded by strikers during the unsuccessful general strike begun Nov. 30, 1938, against the Daladier Government's decree laws

Keystone

PARIS WELCOMES BRITISH SOVEREIGNS

The solidity of Anglo-French friendship was evidenced by the state visit of King George and Queen Elizabeth to the French capital on July 19-21, 1938. The picture shows the King and President Lebrun (in automobile) en route to the Quai d'Orsay

Charitable. With the hospital at Spokane, the Shriners will be operating not only 12 hospitals but five mobile units. On their advisory board are five of the country's most eminent orthopedists. Contributions to the Royal Masonic Benevolent Institution were reported, at its 96th annual festival in London, February 26, as nearly £100,000. The Philippine Grand Lodge, at its annual communication, voted P1000 toward relief work in China from its service fund and authorized solicitation, for the same object, from subordinate lodges and members. The Scottish Rite (Mother) Supreme Council also donated funds which were allocated, one half each, to the National Christian Council and the Chinese Red Cross in Shanghai. The Northern Supreme Council appropriated \$10,000 for New England flood sufferers and \$45,000 for continuing dementia praecox research.

Educational. The Philippine Grand Lodge, at the same communication, adopted unanimously, by a rising vote, a resolution expressing its

most emphatic opposition to the plan of certain members of the National Assembly to introduce religious instruction of a denominational character, in all public schools . . . during regular school hours, and directing the presentation of a copy to President Quezon.

A bill embodying the "plan," in a form ostensibly optional, was passed by the Assembly on May 12, after heated debates, in which the Sergeant-at-Arms was obliged to intervene; but it was finally vetoed on June 7 by President Quezon, who pronounced it "unconstitutional" and challenged its champions to test its popularity in the then impending elections. The 140th Festival of the Royal Masonic Institution for Boys, held in the Masonic Peace Memorial, London, June 8, realized for the school's maintenance over £61,052. The 150th annual Festival of the corresponding Institution for Girls, on May 1, realized over £95,736. The Michigan Knights Templar Educational fund provided 57 loans in 1938, aggregating \$11,000.

Settlement of its long controversy with the "four oldest" Grand Lodges was also effected at the same communication of the Philippine Grand Lodge, by its ratification of an "agreement" for an "advisory council" in China, "with no mandatory or coercive power . . . to limit the rights of membership of any subordinate lodge" or "the sovereign rights of any grand jurisdiction," each of which has but one vote and it "does not bind the respective jurisdictions," each of which "may withdraw and be relieved of any obligations." Such an agreement could probably have been reached at any time in the preceding five years, and would have saved the fraternity much unfortunate and unnecessary strife.

Statistics. *British Commonwealth and Empire.* "The United Grand Lodge of England . . . showed a membership increase of 100,000" in 1938, according to Grand Master Perry of Massachusetts. "English Freemasonry is regarded as one of the props of the Empire," adds the *Masonic Journal* of South Africa. *Canada*, with 9 Provincial Grand Lodges, had 1381 subordinate lodges and 173,654 members. *United States*, with 50 Grand Lodges (including that of Puerto Rico) had 15,719 subordinate lodges and 2,557,028 members. *Other countries*, owing to abnormal conditions (see *infra* Anti-Masonry) are often unable to furnish reliable figures. In the "totalitarian" parts, Masons dare not acknowledge their craft membership.

Anniversaries. Among the many anniversaries celebrated were:

March 22, sesquicentennial of Prince of Wales Lodge No. 259, London.

April 23, Diamond Jubilee of Wisconsin, Scottish Rite Consistory.

May 1, sesquicentennial of Royal Institution for Girls, London.

June 10-12, bicentennial of Masonry in Canada, at Annapolis, Nova Scotia, under auspices of the Grand Lodge of that province.

June 23, 70th anniversary of Mark Benevolent Fund, London, Provincial Grand Master for Lincolnshire, presiding.

July 9, bicentenary of the settlement at Ft. Johnson, N. Y., of Sir William Johnson, British Superintendent of Indians, first Master of St. Patrick's Lodge No. 4 at Johnstown (first Masonic body west of the Hudson) whose present membership, on July 31, assembled at its Hall and marched thence to Sir William's grave in St. John's Churchyard, where commemorative rites were conducted.

August 11, 84th anniversary of first Masonic Lodge meeting in Kansas, observed under the auspices of Wyandotte Lodge No. 3, assisted by the six other lodges of the 4th (Kansas) Masonic District, at Victory Hills Golf Course, near Kansas City.

In September, the Venezuelan Grand Lodge celebrated at Caracas, the centenary of its continuous activity; wreaths were laid on the statue of Bolivar (a Mason) and Urbaneja, first Grand Master there, and a program for the future was discussed.

Anti-Masonry. Austria. At 3 a.m. of March 12, fateful day of the Nazi invasion, police entered the Vienna Grand Lodge headquarters, the keys of which were delivered to them under duress, confiscated its property, and turned the building into an Anti-Communist museum and Nazi library. The grand officers were all arrested, including the venerable Dr. Schlesinger (78), Grand Master (who died shortly afterward), subjected to repeated indignities and insults, and those of Jewish blood held in continuous custody. All Masonic lodges were closed and entrance thereto forbidden. Leo Fischer, who had visited that Grand Lodge and kept in touch with it, wrote in the *Far Eastern Freemason*:

With a select membership of enthusiastic and intellectual men, it dispensed charity, patronized the arts and sciences, and practiced the Royal Art for 20 years. Its official organ, *Wiener Freimaurer-Zeitung*, was a great source of inspiration and information to Masonic journalists the world over. Masonry is better because the Grand Lodge of Vienna has lived.

Czecho-Slovakia. A Prague despatch of October 13, less than two weeks after the much-heralded "Munich Pact" (see INTERNATIONAL LAW), stated that "all Masonic Lodges had decided upon self-dissolution." The "motive" was disclosed in another part of the item, which explained that, in Slovakia, lodges not so dissolving would be forcibly suppressed. Accordingly, the two Grand Lodges—the National, working in Czech, and *Lesing zu Drei Ringen*, in German, which had long worked in harmony—announced their dissolution; but the Grand Commander of the Czech Supreme Council expressed his intention of attending the International Conference at Boston in 1939.

Germany. The "Nazi Primer . . . for Hitler Youth," recites that "the racial ideals of National Socialism have implacable opponents. Freemasons, Marxists, and the Christian Church join hands in brotherly accord on this point." To celebrate the seizure of Austria, Hitler proclaimed "amnesty" for Nazi party members charged with "offenses" committed before April 10, including former Freemasons who had not taken the highest degrees.

Hungary, where Masonry was officially banned soon after the World War, but where Masonic charities were allowed to continue, is now so much under Fascist-Nazi domination that even such forms of activity are regarded as menaced.

Ireland. A bomb was exploded on the night of March 28, in the garden of an ancient structure in Belfast, used by 23 Masonic Lodges and the Ma-

sonic charity organization. Fortunately little damage resulted.

Philippines. The (R.C.) bishop of Jaro, in a pastoral letter, referred to the school system introduced by the American government as "this purely civil education, maintained and propagated by the Masonic sect," and called upon Vice-President Osmeña, Secretary of Public Instruction, and a Catholic, to support the compulsory religious instruction bill (see *supra*, p. 269). The latter replied:

You refer to enemies. . . . Masons and Protestants. . . . You are mistaken in believing that the Government can make any distinction between Masons, Protestants, and Catholics.

Poland. Following closely upon the anniversary (October 8) of the death of Count Pulaski, a Mason, came the announcement on November 24 that the Polish Government had "outlawed the once powerful organization of Scottish Rite Masons" in that country, and that "Masonic property was ordered confiscated for the benefit of charitable organizations."

Assemblies, Congresses, Conventions, ETC. (National and International):

February 21-23, annual National Grand Masters' Conference and meeting of George Washington National Masonic Memorial Assn. at Washington, D. C. and Alexandria, Va.

April 27, annual Grand Festival of premier (Eng.) Grand Lodge at Freemasons' Hall, London.

June 1-4, 33d annual convention of National League of (400) Masonic Clubs (aggregating over 100,000 members) at Philadelphia.

June 7-9, annual Convocation of Shriners (A.A.O.N.-M.S.) at Los Angeles, attended by over 100,000 members; A. D. Rahn of Minneapolis, elected Imperial Potentate.

June 7-9, annual convention, National Sojourners at Detroit.

June 26-30, 49th annual convention, Mystic Order of Veiled Prophets, Cleveland.

September 1-4, International Masonic Assn. meeting at Lucerne, Switzerland.

September 3-6, Universal League of Freemasons meeting at Paris; international Masonic *rapprochement*, chief subject of discussion.

September 24-29, 126th annual session, Northern (U.S.) Supreme Council, Scottish Rite Masons, Columbus, O.

October 1, Supreme Council of Colombia met at Cartagena; differences with seceding members healed and headquarters moved to Bogotá.

October 3-5, Canadian Supreme Council's annual session at Halifax, N. S.; closed with an "historical pilgrimage" to Grand Pré and Annapolis Royal.

November 21-23, Centenary of Arkansas Grand Lodge celebrated at Little Rock, in Memorial Temple, named for Albert Pike, active in its affairs after 1850.

Bibliography. The most important Masonic historical publication of the year is the critical (limited) edition of the *Two Earliest Masonic Manuscripts* ("The Regius" and "The Cooke") by Douglas Knoop, G. P. Jones, and Douglas Hamer. Although published before the invasion of Czecho-Slovakia, *Po estak ke Kralovskemu uměnu (Steps Leading to the Royal Art [Freemasonry]*, pp. 200), by Jiri V. Sedmik, former Grand Secretary for Foreign Affairs of the now suppressed National Grand Lodge of that country, should prove of special interest at this time.

FRENCH CAMEROON. See CAMEROON, FRENCH.

FRENCH CONGO. See FRENCH EQUATORIAL AFRICA.

FRENCH EQUATORIAL AFRICA. A French colonial territory, comprising the colonies of Gabon (93,219 sq. mi.; pop., 409,739), Chad (461,202 sq. mi.; pop., 1,432,555), Middle Congo (166,069 sq. mi.; pop., 746,605), Ubangi-Shari (259,388 sq. mi.; pop., 833,916). Total area, 979,878 square miles; total population (1937 estimate), 3,422,815. Chief towns: Brazzaville, the capital, 4000 inhabitants; Fort Lamy, 6000; Libreville,

4500; Bangui, 13,500; Port Gentil; Pointe-Noire. In 1937 there were 18,952 pupils enrolled in the 203 schools.

Production and Trade. The natural resources of the country are undeveloped. Many species of trees of industrial value, including wild rubber, grow in tropical forests having a total area of some 300,000 square miles. Cotton, groundnuts, maize, coffee, sesame, palm oil and kernels, cacao, wild rubber, copper, zinc, lead, and ivory were the chief products. In the colony of Chad, large numbers of cattle, sheep, asses, camels, horses, and ostriches are raised. Gold exported in 1937 amounted to 21,187 troy ounces. In 1937 (in old U.S. gold dollars) merchandise imports were estimated at \$7,600,000 (\$6,300,000 in 1936); merchandise exports, \$7,200,000 (\$5,800,000 in 1936). A railway connects Brazzaville with Pointe-Noire on the Atlantic, a distance of 318 miles.

Finance. The system of government introduced by the decree of June 30, 1934, allows only a general budget for the whole of French Equatorial Africa, and no individual budgets for the colonies. Local revenues are obtained mainly from customs duties; there are native poll taxes. For 1938 ordinary revenue and expenditure were estimated to balance at Fr139,794,516; extraordinary expenditure totaled Fr28,374,360; public debt, Fr16,536,955 (franc was worth \$0.0279 on June 16, 1938).

Government. According to the decree of June 30, 1934, French Equatorial Africa was consolidated into a single administrative unit under a governor-general aided by an administrative council and a secretary-general who assumes control during the governor-general's absence. Governor-General, J. F. Reste (appointed March, 1936).

FRENCH GUIANA (gê-à'na) AND IN- INI. A French colony in South America. Area, about 34,740 square miles; population (1936), 30,906. Cayenne, the capital, has 11,704 inhabitants; the other 14 communes have a total of 11,994 persons exclusive of the penal settlement of Maroni, the floating population of miners without fixed residence, and officials, troops, and native tribes. There are three ports—Cayenne, St. Laurent-du-Maroni, and Oyapoc.

Production and Trade. Rice, maize, manioc, cacao, coffee, and sugar cane are the main crops. The forests are rich in timber and commercial gums. Gold mining (1417 kilograms exported in 1936) is the main industry. In 1936 imports were valued at 45,343,821 francs; exports, 26,536,884 francs (franc averaged \$0.0611 for 1936). In 1937 there were 203 miles of roads.

Government. The budget for 1937 was balanced at 17,704,755 francs. A governor administers the colony aided by a privy council, and a council-general elected by the French residents of the colony. One deputy represents the colony in the French parliament. By the Decree of July 6, 1930, French Guiana was divided into two independent divisions—the coastal division remained French Guiana and the interior was named Territory of Inini.

FRENCH GUINEA. See FRENCH WEST AFRICA.

FRENCH INDIA. The colonies of France in India, consisting of Chandernagor, Karikal, Mahé, Pondichéry, and Yanaon. Total area, about 196 square miles; population (1936 estimate), 300,000. Pondichéry (capital) had 48,896 inhabitants (1936 estimate). The chief products (with 1936-37 production figures, in metric tons, in parentheses) are: Rice (23,700); groundnuts (5200); and manioc.

Livestock in the colonies (Dec. 31, 1936): 59,717 cattle, 24,300 sheep, and 33,505 goats. In 1937 the estimated value of general imports (in old U.S. gold dollars) was \$4,300,000 (1936, \$3,500,000); exports, \$3,600,000 (1936, \$2,900,000).

The local budget for 1936 showed revenue of Rs3,269,715 and expenditure of Rs3,239,715 (rupee averaged \$0.3752 for 1936). The colonies are administered by a governor (nominated by the President of France) aided by an executive council of 5 members and an elective general council of 28 members. In the French parliament the colonies are represented by a senator and a deputy.

FRENCH INDO-CHINA. A French dependency in southeastern Asia comprising the divisions shown in the accompanying table.

Division	Sq. m.	Pop. (1936)	Capital
Annam ^a	39,758	5,653,200	Huê
Cambodia ^a	67,550	3,047,100	Pnom-Penh
Cochin China ^b	26,476	4,618,600	Saigon
Kwangchowan ^c	200	200,000	Fort Bayard
Laos ^a	89,320	1,010,800	Vientiane
Tonkin (Tongking) ^a	40,530	8,699,500	Hanoi
French Indo-China ...	263,834	23,229,200	Hanoi ^d

^a Protectorate. ^b Colony. ^c Also known as Kwangchow. Leased from China for 99 years in 1898 (territory increased in 1899) and placed under the authority of the Governor-General of French Indo-China. ^d The capital city is Hanoi, but during certain seasons of the year, when climatic conditions are oppressive, the government offices move to Saigon.

Chief towns: Hanoi, the capital, 148,633 inhabitants (1936); Haiphong, 122,000; Saigon, 111,000 (1936); Pnom-Penh, 102,678 (1936); Cholon, 145,000 (1931); Binh-Dinh, 147,199 (1931); Tchekam, 35,000 (1935); Huê, 33,222 (1934); Battambang, 22,000 (1931); Fort Bayard, 12,000 (1935); Vientiane, 28,000 (1931). In 1936 the 6532 primary, secondary, and professional schools (exclusive of many private schools) had a total of 439,150 students; the university of Hanoi had 541 students.

Production and Trade. The output (in metric tons) of the chief products for 1936-37 was rice (rough), 6,316,200; maize, 459,600; rubber, 44,070 (57,000 for 1938); cane sugar, 41,500; tobacco, 14,300; groundnuts, 15,300; copra, 10,700; pepper, 3791 (exported); coffee, 2300; cottonseed, 3000; sesamum, 2100; cotton, 1300; tea, 1100; coal, 2,198,000; phosphates, 11,000; zinc, 4200; manganese, 1900; salt, 142,000; tin, 1500. The production of alcohol in 1937 totaled 10,329,086 gallons (U.S.). Gold, produced in 1937, totaled 5051½ troy oz. In 1937, excluding bullion and specie, imports were valued at 1,578,600,000 francs; exports, 2,589,200,000 francs (franc averaged \$0.0405 for 1937).

Communications. There were, in 1937, 21,021 miles of highways and 2087 miles of railway line of which 1565 miles belonged to the government. A weekly air service between Saigon and Batavia (Netherlands Indies) was inaugurated during the year; it is an extension of the Batavia to Singapore service. Air France operated air services between Hanoi and Vientiane, and from Saigon to Bangkok (Siam). In 1936 there were 5441 miles of telephone line, 12,057 miles of telegraph line, and a radio-telephonic service to Europe from Saigon.

Finance. The budget for 1938 was balanced at 89,206,800 piasters (1 piaster equals 10 French francs), which was an increase of 18,828,000 piasters over the revised 1937 budget. A rise in prices as a result of the devaluation of the French franc was the reason given for the increase. On Jan. 1, 1937, the public debt amounted to 1,971,120,000 francs.

Government. The government for the whole of French Indo-China is administered by a governor assisted by a secretary-general, a government council, and a grand council for economic affairs. Cochin China, which is a direct French colony, is headed by a governor aided by a colonial council, and each of the four protectorates is headed by a resident-superior assisted by a protectorate council and a council of economic affairs. Governor-General, M. Jules Brevié (appointed, Sept. 13, 1936).

History. The Japanese advance in South China during 1938 and Japanese efforts to establish a dominating influence over Siam greatly alarmed the French Government as to the safety of French Indo-China. Fearing that a Japanese landing on Hainan Island, dominating the Gulf of Tonkin, was imminent, the French with British support warned Japan in June that such a move would threaten their peaceful relations. A Japanese attempt was made to occupy the strategically placed Paracel Islands, claimed by both France and China. This led the French authorities early in July to send a small armed force to the islands as a warning that they would not tolerate a Japanese base there.

The French also feared a direct Japanese attack upon Indo-China from either the east coast or overland from Siam. Japanese warships cruising along the coast, flights by Japanese airplanes over Haiphong, and anti-French propaganda entering Indo-China from Siam, apparently under Japanese sponsorship, all contributed to this fear. To meet this threat, the French Government decided to fortify the harbor of Cam Ranh in southern Annam and to make it the principal French naval base in the Far East. Work was started on this project during 1938 as part of the French colonial defense program undertaken with a 400,000,000-franc loan. A 33,000,000-piaster loan was raised in French Indo-China early in July, permitting the enlistment of 20,000 additional native soldiers and other military preparations.

Early in the year the Japanese Consul at Hanoi demanded that the French authorities prohibit the transport of war material into China over the Haiphong-Nanning (Yunnanfu) railway. He threatened a Japanese aerial bombardment of that part of the line running through China if the munitions traffic continued. The French at first rejected this demand on the ground that Japan had not declared war on China and that Japanese ships were using Indo-Chinese ports to load coal, ore, salt, sand, and cement. But after the Japanese occupation of Canton in October, the Japanese attitude became so threatening that the French terminated the munitions traffic, reportedly in return for a Japanese pledge not to invade Hainan Island. See CHINA and SIAM under History.

The devaluation of the French franc on May 6, 1938, increased currency difficulties in French Indo-China and adversely affected business. Devaluation made the contents of the silver piaster coin worth about 10 per cent more than the exchange value of 10 francs. This led to an abnormal exchange of paper piasters for silver coins, which were melted down and sold on the bullion market.

FRENCH IVORY COAST. See FRENCH WEST AFRICA.

FRENCH LITERATURE. This was an exceptional year for French Literature; they founded no new academy, they inaugurated nothing on the stage, no new *ism* has been added to the already endless list of them, no rising star has been discovered in any field. There were, however, some

celebrations: The third centenary of the birth of Le Roi Soleil was the occasion of great festivities at Versailles, which were combined with the festivities in honor of the King and Queen of England, June 19-24. Lulli's opera *Acis et Galatée* was performed on the newly restored Théâtre Montausier. At the Opéra in Paris, two other ballets of Lulli were represented; the Comédie Française revived Racine's *Esther*, the Odéon and other theaters also revived 17th century plays. Shortly after, there was the celebration of the restoration of the Reims cathedral in July, with a special play by the famous Catholic poet Henri Ghéon, *Les Grandes Heures de Reims* (Baptême de Clovis, Sacre de Charles VII, Passion de Reims), and the Théophiliens (see earlier YEAR BOOKS) gave the famous 12th-century mystery play *Le Jeu d'Adam* in front of the Cathedral. A great deal of attention was paid to the centenary of the Société des Gens de Lettres: receptions by the President of the Republic, by the City of Paris, and by the French Academy at Chantilly. A royal celebration, commemorating 50 years of a life devoted to art, was given Yvette Guilbert, the famous singer, at the famous Salle Pleyel, June 21, in the presence of the Minister of Public Education and of representatives of the French Academy, of the Goncourt Academy, of the Société des Gens de Lettres, and of the clergy. The third centenary of Malherbe was remembered in a solemn meeting at the Sorbonne, on July 2. Let us finally record a new attack on modernism—here the cinema—by Duhamel, at the joint meeting of the five Academies in October.

Literary Prizes. The increasing number of "Prix littéraires" makes it impossible to mention any except a few outstanding ones: "Grand Prix de litt." (Académie) in June, Tristan Derème (increased from 10,000 to 20,000 francs); "Grand Prix du roman" (Académie) in June, J. de la Varende, for *Le Centaure de Dieu*; "Grand Prix d'Académie," Alex. Arnoux, for *Le Rossignol napolitain*; "Prix Broquette" (Académie), Paul Cazin; "Prix de litt. coloniale," René Guillot, for *Frontières de la Brousse* (short stories); "Prix de la Critique": Yves Gandon (of the *Nowelles litt.*) and Marius Richard (of the *Revue de France*); "Prix Lasserre," Marcel Jouhandeau, for *Chroniquea maritales* and *Le jardin de Cordoue*; the "Prix Léon Barthou," given for the first time to a woman for "l'ensemble de son œuvre," to Marcelle Tinayre. The December awards were: "Prix Goncourt," to Henri Troyat, for *L'Araigne* (he had won the "Prix populiste" in 1935); "Prix Femina," to Félix de Chadourne, for *Caroline ou le départ pour les îles*; "Prix Renaudot," to Pierre-Jean Launay, for *Léonie la bienheureuse*; "Prix interallié," to Paul Nizan, for *La Conspiration*. For the "Prix de poésie," see a long list in *Mercur de France*, March, 1938, awards made by the Comité de la société des poètes français.

Poetry. In this domain, there is not much that calls for mention. Whoever desires more details should look up the regular accounts in the *Mercur de France* by André Fontainas, a veteran in the field. Here the following names will suffice: P. Claudel, *Un poète regarde la Croix*; Nicolas Beaudouin, *Dans le songe des dieux*; Pierre Jolabert, *La couronne de lumière*; Roger Lannes, *Les voyageurs étrangers*; Henriette Charasson, *Sur la plus haute branche*—all excellent and pertaining to the style of traditional or religious poetry. Tristan Derème (the laureate of the French Academy) continued his fanciful series (see former YEAR BOOK) with *Le poème des Griffons*, while Henry

Charpentier (newly elected to the Académie Mallarmé) wrote in the "Symboliste-romane" note of Moréas in *Signes*, and in *Dyptiques* he imitated Virgil in lines reminding of the "Vers baifins" of the Renaissance. Jean Dyssord, in his cryptic *Les dés sont jetés*, has embarrassed critics not a little.

By Charles Massonne, in a collection called *Vers et Versets*, a new attempt was made—they were frequent in recent years—to construct in French a "vers accentuel," that is, adopting instead of the syllabic verse of traditional French prosody, the count by accented syllables as in the old classical meter (he counts as many as seven "syllabes accentuelles" in a line). Yvan Goll patronizes all sorts of modernisms in *Jean sans Terre* (the title itself being allegorical). An interesting account of modern Belgian poetry was given by G. Charlier in *Revue de France* (August number). The first lesson of P. Valéry at the Collège de France, last winter on the essence of poetry, is reprinted in *Introduction à la poésie* (*Nowv. Rev. fr.*).

Plays. Tragic plays outnumbered others in 1938. The year opened with Jean Arnouilh's *La sauvagerie*, played by Mme. Pitoëff: a girl brought up in a sordid milieu of café-concert, has a chance to know the life of the fortunate ones, accepts first, but the memory of the miserable life of her own people causes her to tear her beautiful dresses and return to share the miseries of her own people. Just as discouraging is Paul Vialar's *Les indifférents* (from a novel by Moravia), a world of blasés with not a trace of energy left to "live." Roger Vildrac's *Les Demoiselles du large* is the type of play given at the Théâtre de l'Oeuvre—three suicides. Marcel Achard thinks that the world does not know enough yet of Freud and abnormal beings and offers *Adam*, the rivalry of a man and of a woman for the love of a man—he calls it a comedy (!). Jouvet, at the Athénée, gave another play by Achard which aroused a good deal of curiosity—*Le Corsaire*. It takes place in Hollywood and illustrates the theory of the reincarnation. An actress is supposed to fall in love with a pirate; this woman, while rehearsing, suddenly recognizes the whole story on the ship: she is the reincarnation of the woman of a time long past.

Five plays at the end of the year made a special appeal to the public: Salacrou's *La Terre est ronde*, which puts on the stage the history of Savonarola (Dullin)—first a young libertine, then the fiery apostle of regeneration in Florence, and finally burned as a fanatic; Sacha Guitry's *Un monde fou*, a not very novel idea—that men and women perfectly reasonable in life become "fou" when in love—but the story is so wittily presented that the theme looks new; the third is a very curious attempt by Gaston Baty to make a play with *Dulcinée* as the chief character: on his deathbed Don Quichote blesses her, she believes herself to be a saint destined to reform the world, is mocked copiously by the people, but insists on dying with her belief that she is what Don Quichote held her to be (Sancho Pança plays an important part in the whole plot); F. Cocteau's *Les parents terribles*—more painful, if possible, than his earlier *Les enfants terribles*; and *Duo*, arranged by Géraud from Mme. Colette's novel (see YEAR BOOK, 1937). A single representation was given at the Théâtre Français of Gabriel Marcel's one-act play *Le Fanal*, a sort of plea for moral regeneration. Julien Luchaire (who triumphed last year with *Altitude 3,200*) tried this year, apparently with less success, a play in the vein of Giraudoux called *Une femme qui s'en va*: It is the story of the

Bérénice of Racine treated ironically; when Bérénice hears that Titus, the Roman Emperor, has decided to sacrifice his love to his imperial throne, she turns her back on him with utter contempt—just an emperor, not a man! Giraudoux himself gave a one-act play—wit on love—*Cantique des Cantiques* (Comédie fr.).

The lighter plays of the year were few, but successful. It was once more the remarkable talent of the actor V. Boucher that made Armont et Marchand's *Le valet et le maître*; Arnouilh's *Le Bal des voleurs*, a comédie-ballet, reminds one of the gay vaudevilles of Labiche. Then two plays had a great run: Claude-André Puget's *Les jours heureux*, which brought to the pen of several critics the name of Alfred de Musset—an honor indeed!—and Paul Vandenberghe's *J'ai 17 ans*, an episode in the life of a young man who is young in the good old sense of the word, spontaneous, somewhat naïve, but with a big heart, and who meets as a man a painful family situation.

Saint-George de Bouhélier gives another of his historical plays, *Le Roi Soleil*, a subject chosen in connection with the tercentenary of Louis XIV. Another historical play was *Tricolore*, by Lestrin-guez—once more the heroine of Revolutionary Days, Théroigne de Méricourt.

The great number of "reprises" must be taken as an indication that relatively few masterpieces were offered to stage directors: Racine, Molière, Musset furnish, it seems, more than the usual crop of classic plays at the Théâtre français; a good deal of comment was brought about by an amusing revival of one of Labiche's most amusing farces, *Le Chapeau de paille d'Italie*. A new interpretation of the *Misanthrope* with oriental costumes and scenery was tried at the Ambassadeurs. The centenary of Hugo's *Ruy-Blas* (Th. français) caused surprise to many who did not think that Hugo would today produce such an impression. Foreign playwrights also were called upon to fill programs: Sarment adapted *Othello* at Monte-Carlo (himself playing Iago) and Henri Lenormand adapted an apocryphal Shakespeare play *Aden de l'aversham*, one of the interesting features being the staging by the famous Baty. To note also, at the théâtres d'Avant-garde as they are called: Dullin (Atelier) reconstituted Aristophanes's *Plutus* with great success, and followed it with Fr. Garcia Lorca's extremely tragic Spanish and violent *Noces de sang*. Spain triumphed also at the Théâtre du Peuple (Place du Châtelet) when Jean Cassou and Jean Camp adapted Lope de Vega's *Pont-aux-Cabres*, a popular drama, very tense, of a sort of Joan of Arc who leads an uprising of the peasants of Spain against the lords.

The Novel. The crop was abundant, but not more than in previous years. Familiar names are those of: Henri Bordeaux (*Affaire de la rue Lepic*), P. Benoît (*Betsabé*), H. Bachelin (*M. Hilde-jonse*), Ferdinand Herold (*Amants hazardés*—the symbolist vein). Several novels that attracted attention were inspired by world political events: *Le Volontaire*, a study of Fascist devotion, by Pierre Frondaie; *Roc de Gibraltar*, a spy story, by Joseph Peyre; *Glaïeul noir*, very exciting adventures of a woman connected with the Red Cross in Spain, by Lucien Malvault. *Cinq de Campagne*, by M. E. Grancher, takes the reader back to the World War, but, this time, in an alert although not flippant mood, reminding of the style of the famous *Gaspard* by R. Benjamin way back in 1915.

L. Pergaud's *La guerre des Boutons* is an amusing satire on war, or rather the flimsy causes of

many wars, which is well known in this country by the film *The Generals without Buttons*. The "roman paysan" or "roman régionaliste," which has been so popular since Giono, Ramuz, Raymonde Vincent, Roussel, Rogissant (see YEAR BOOK, 1937), was represented in 1938 by R. Genevoix's *Bernard* (whose hero is the son of Benoit Chambarcaud of Tête baissée in a preceding novel) and by Ramuz's *Si le soleil ne revenait pas*, again a drama in a valley of the Swiss Alps.

Novels in the realm of the mysterious world: Gabriel Mourey's *L'amateur de fantômes* offers a sort of philosophical story of a man who suffers from concussion of the brain after an automobile accident, lives over an early existence when he was a Greek of the glorious age of Pericles; and, when he awakes, he finds that man is ever the same, that all the exterior progress of civilization has not altered the meaning of life much; C. J. Odiat's *l'Ombre de la Barraquer*—a weird story—the phantom of a suicide returns to earth to drag into his nets a living creature, this brings about another suicide and then the "ombre" dissolves, its aim being fulfilled; Plisnier (author of *Faux Passe-ports*, 1937 "Prix Goncourt") publishes *Le Sacre*; and another Belgian author, Marie Gevers, in *La ligne de vie*, tells the story of a sorcerer in Flanders, back in the 17th century. The greatest success, however, in this domain was *Léonie la bienheureuse*, by Pierre J. Launay, which carried the "Prix interallié" in December; Léonie is a good and pious peasant woman whose husband is lead astray by a frivolous rival; Léonie, after having tried regular prayer to bring her husband back to her, accepts the services of a sorcerer; but she gives up when she witnesses the weird ceremonies; she dies finally in an accident, offering her soul to God.

In addition, one has to take into consideration a number of even more terribly pessimistic stories, for they are of indisputable merit; one is more gloomy than the other, none, however, being morbid: Andrée Sirkoska's *Vent de mort*—two beings completely broken by ill luck; J. P. Sartre's *La nausée*, very highly praised by Ed Jaloux in spite of its distressing content; Jean Guiréc's (author of *La Maison au bord de l'eau*, 1937) *L'enchantement de la nuit*—a story of a girl fundamentally honest who is brought up in a sordid milieu; finally, one day, she falls and then commits suicide; André Richaud's *La Barette rouge*, which takes place in a former palace of a cardinal; there a man having known a childhood in horrid slums, and who deems himself cursed, revolts and in his madness assassinates a young woman. Cécil Lothe, the "populist" writer, adds *Maman Joujou* to her earlier novels of the slums. In some of these novels the Freudian note is easily traced: Ch. Braibant's *Le soleil de mars*, a sincere and painful story of a child too early initiated to the secrets of sexual life; Chr. Mégret's *Ils sont déjà des hommes*, which deals with an institution of orphans, children born of parents who were in artistic professions; Robert Francis's *La jeune fille secrète*; Francis de Roux's *Brune*, one of the novels especially well received by critics as a remarkable psychoanalytical study of a love-thirsty woman.

Other authors hailed as masters were: La Varen-de, who jumped into fame in 1937 with *Nes-de-Cuir*, and in 1938 won the "Grand Prix du roman" of the French Academy with *Le Centaure de Dieu*, tells the story of a nephew of Nez-de-Cuir in which there is a remarkable struggle between the passion for horses and a mystical devotion for God; the story is told in the same vigorous style as the

earlier story; and such is the case again of another book, *Les Mamants du Roi* (150 years of the history of a family of noble birth); H. Troyat, winner of the "Prix Goncourt," in *l'Araignée* (sic), gives a portrait of a man whose sensitive nature brings him to the brim of insanity; he belongs somewhat to the Salavin family of Duhamel; Paul Nizan, "Prix interallié," revealed himself a remarkable narrator in a story, *La Conspiration*, that calls to mind Barrès' *Les Déracinés*; namely, three young men, with a solid education who conspire to overthrow the government; Nizan is savage in his mockery of the futile attempts. A novel parallel to this is R. Millet's *L'Ange de la révolte*, in which young men coming, this time, from the popular, uneducated class, nourish the same ideas of revolt, and also fail utterly (it is very interesting to note that Nizan is a contributor to *Le Temps*, while Millet works on the staff of *L'Humanité*, the socialist paper). George Blond's *Prométhée délivré* was also among the most favorably reviewed stories of the year; this reminds one of Jules Romain's *Monsieur Le Trouhadec*; but here it is a politician who is grotesquely distracted from his call in life by a lively lady. Bernard Barbey, in *Le Crépuscule du matin*, writes about the Oxford movement which is rather strong in French Switzerland (M. Barbey is from Geneva). The 7th volume of Duhamel's *Chronique des Paquier*, *Cécile parmi nous*, seems to have been acclaimed even more than *Les Maîtres*, of 1937. Jules Romain offers vol. xv and xvi, *Prélude de Verdun* and *Verdun*, of his *Hommes de Bonne Volonté*.

Novels by women include: Irène Némiroski, *La Proie*, very somber but without the power of her former novels; André Corthis, in *Masques*, appears to try to imitate Mauriac's style; Hedwige de Chabannes, an aviatrix, attempts a psychology of aviation in *Port de l'air*; Gilette Ofaire's first novel, *Sylvie Velsey*, has been hailed as a very promising book, telling the woes of an unhappy childhood and of a consistently unhappy later life—which, however, tempers a character of rare fortitude.

In a class by itself must be placed an allegorical story by Luc Durtain, *Les Bohohom*, which takes place among the clouds symbolizing the thinness of utopias of all sorts of men in our modern world. Some have praised it, some felt like ridiculing it, but the satire is rather good-natured.

It is impossible to give the titles of many very remarkable short-story volumes. A few would include: Mauriac, *Plongées*; Blaise Cendrars, *La vie dangereuse*; G. Simonon, *Les sept minutes*; Jules Supervielle, *L'arche du Noé*; Mary Yourcenar, *Nouvelles orientales* and *Les songes et les sorts*.

Various Items. Books of recollection are always numerous. One may quote as especially important: Barrès' *Cahiers XI*, containing the notes of the author during 1914-18; Julian Green's *Journal* (about his journey back to America, which will not fail to interest and perhaps provoke his countrymen); and, since Julien Benda was heard as a lecturer in America, one may mention his autobiographic *Un régulier dans le siècle*, which amounts to a confession of failure on his part to get his chance in life; but he does not accuse his Jewish origin for that failure. Two books, very different in spirit on the Jewish problem: One in the virulent style, by Céline, *Bagatelle pour un massacre*; the other in the witty style of La Fouchardière, *Histoire d'un petit Juif*. On the question of Islam in the Orient: vol. ii of the brothers Tharaud, *Les mille et un jour de l'Islam*; vol. ii,

Les grains de la Grenade; and, with a more timely message, *Alerte en Syrie*. On Spain: A. Malraux's *Espoir*, and *L'Espagne en sang* (eloquent appeal of one who fought on the side of the Loyalists); Bernanos's *Les grands cimetières sous la lune* is a cry of horror on the madness of modern humanity. On the general situation in Europe two well-known writers have spoken: Roland Dorgelès, *Frontières*, *Massacre sur l'Europe* and René Benjamin, *Chronique d'un temps troublé*, the latter in a sarcastic vein. One voice was raised praising the firm hand of Hitler: Chateaubriant, *Gerbes de force*. The popularity of books on history continue to be much favored; the brothers Marius-Ary Lebond published vol. ii of their *Vercingétorix*; P. Morand gave *Isabeau de Bavière*; La Varendre, *Anne d'Autriche*; Paul Reboux, *La Belle Gabrielle qu'aima Henri IV*; M. Tinayre, *Mad. de Pompadour*; P. Gaxotte, *Frédéric II*; Aubry, a *Sainte-Hélène*; Mongédien, *Vie privée de Louis XIV*, etc.

Criticism and History of Literature. Excellent works were published, but many would be of interest only to specialists. The following, although very scholarly, may be mentioned here: *Montaigne*, by Professor Strowski (just retired from the Sorbonne); *Vie et Oeuvres de Rablais*, by Georges Lothe (568 pp.); a very lively *Corneille*, by R. Brasillach; *La Fontaine*, by Bailly, which is excellent, has been somewhat thrown into the background by Giraudoux, "l'auteur à la mode," on *Les cinq Tentations de LaFontaine*. Voltaire inspired several books, one G. Piguet, *M. de Voltaire et la vérité sur sa vie amoureuse*; and two others, very different in tone: one exalting Voltaire's good nature, by Prof. N. Torrey of Columbia, the other terribly sceptic about the merit of Voltaire by John Charpentier.

A. Maurois' *Chateaubriand* was praised highly in France, and at the end of 1938 had been translated into English. Marcel Duchemin's *Chateaubriand* is more of the erudite type of book. Pierre Jourda, *L'exotisme dans la litt. fr. depuis Chateaubriand, Le Romantisme*; this came shortly after two volumes by Alf. Béguin, *L'âme romantique*. On Romantic authors: Antoine Adam treats once more, and without repeating his numerous predecessors, the story of Musset and Sand, *Le secret de l'aventure vénitienne*; L. Arbellet, *Louison, ou les perplexités amoureuses de Stendhal*. The eternal Balzac appears again in the work of S. de Korwin-Piotrowska, *Eveline Hanska de Balzac*. A new volume of Sainte-Beuve's *Correspondance* is greeted as an event. Marie-Louise Pailleron has a *George Sand, Histoire de sa vie*. Contemporary writers received their share of attention; for example, L. Bidal, *Les écrivains de l'Abbaye* (Duhamel, Jules Romain, Vildrac, Durtain, etc.); very amusing souvenirs of symbolists in Jean Ajalbert, *Mémoires en vrac*; É. Noulet tackles *Paul Valéry*, and L. Aragon, in an article of *Europe*, March 15, explains the connection between surrealism and communism. Yves Gandon, awarded the "Prix de critique littéraire," in his *Le démon du style* publishes in a volume his articles of the *Nouvelles litt.* on Montherlant, Suarès, Gide, Duhamel, Bernanos, Giono, Maurois, etc.

The French Academy received: Jacques de Lacretelle (January 27), Léon Bérard (March 3); elected: Ch. Maurras, to replace Doumic (June 9), A. Maurois, to replace Me. Henri-Robert (June 23), Jérôme Tharaud, to replace J. Bédier (December 1). The Académie Goncourt elected René Benjamin, to replace Raoul Ponchon (June 1). The

Académie Mallarmé elected Henry Charpentier. **Necrology.** Among those who died during the year may be noted J. Bédier (q.v.); Ferd. Brunot, the author of *Histoire de la langue française*, and until recently dean of the Faculté des Lettres, University of Paris; Francis Jammes, the symbolist poet; and Henry Kistemaekers, the playwright.

FRENCH SUDAN. See FRENCH WEST AFRICA.

FRENCH TOGO. See TOGO, FRENCH.

FRENCH WEST AFRICA. A French colonial territory comprising the colonies shown in the accompanying table.

Colony	Sq. mi.	Pop. (1936)	Capital
Dahomey	43,232	1,351,511	Porto Novo
Dakar ^a	60	92,634	Dakar
French Guinea	96,886	2,011,172	Conakry
French Sudan ^b	590,966	3,568,966	Bamako
Ivory Coast ^b	184,174	3,850,653	Abidjan
Mauritania	323,310	383,098	St. Louis ^c
Niger ^b	499,410	1,746,878	Niamey
Senegal	77,730	1,697,671	St. Louis
French West Africa ..	1,815,768	14,702,583	Dakar

^a Including Dependencies. ^b Upper Volta ceased to be a colony on Jan. 1, 1933, and its territory was divided among three other colonies as follows: French Sudan received 20,226 square miles; Ivory Coast, 59,212 square miles; Niger, 27,290 square miles. ^c The lieutenant-governor of Mauritania resides in St. Louis in the colony of Senegal.

Chief towns: Dakar (capital), about 42,000 inhabitants; Saint Louis, 33,066 (1936); Porto Novo, 25,724 (1935); Bamako, 22,000 (1936); Abidjan, 17,476 (1935); Grand Lahou, 16,430 (1935); Kaolak, 15,645 (1936); Diourbel, 15,544 (1936); Ouagadougou, 14,172 (1935); Rufisque, 13,559 (1933).

Education. The 688 schools of all kinds had 76,040 pupils enrolled in 1935-36; the expenditure for education amounted to 22,410,108 francs.

Production and Trade. The chief products (with production figures for 1937 unless otherwise stated), in metric tons, were groundnuts (890,000), maize (536,500 in 1936), rough rice (413,000), cacao (48,100 from Ivory Coast), palm kernels (36,700), palm oil (20,100), cottonseed (18,000 in 1936), coffee (9800 from Ivory Coast), cotton (5500 in 1936), tobacco (26,000), sesamum (700 in 1936), and wool (200 in 1936 from French Sudan). Gold produced during 1936 amounted to 125,101 troy oz. Textiles, fuel oil, machinery, food-stuffs, and beverages were the main imports. In 1937 (values are given in old U.S. gold dollars), imports were valued at \$39,200,000; exports, \$40,300,000.

Communications. In 1938, the railways, consisting of four main lines connecting each of the coastal territories with the Niger Valley, had a total length of 2324 miles exclusive of narrow-gauge lines. There were over 27,300 miles of roads. Air services were operated between Dakar and Pointe-Noire, Middle Congo, and between Cotonou in Dahomey and Toulouse, France. During 1936, 10,552 vessels aggregating 13,878,362 tons cleared the ports.

Finance. The various budgets for 1938 (with 1937 figures in parentheses) were balanced as follows: General budget, Fr335,000,000 (Fr200,200,000); the aggregate of the local budgets, Fr498,162,000 (Fr299,589,000); supplementary budgets, Fr478,597,000 (Fr347,788,000). The franc (Fr) averaged \$0.0405 for 1937; \$0.0288 for 1938.

Government. French West Africa is governed by a governor-general, aided by a council, the seat

of the government being at Dakar. Each colony is under the direct administration of a lieutenant-governor, and the circumscription of Dakar is under a chief administrator, all subordinate to the governor-general who was relieved of the direct administration of any part of his government so that he could direct and control the common interests of all the colonies. Governor-General, Jules M. de Coppet (appointed, Sept. 13, 1936).

FRIENDLY ISLANDS. Same as TONGA ISLANDS.

FRIENDS, RELIGIOUS SOCIETY OF. A mystical religious sect which originated in England in the middle of the 17th century under the leadership of George Fox. For early history see *THE NEW INTERNATIONAL YEAR BOOK* for 1932 and *THE NEW INTERNATIONAL ENCYCLOPEDIA*, vol. ix, p. 285.

Five Years Meeting. In 1902 the largest body of the Religious Society of Friends, known as the Orthodox Group, organized the Five Years Meeting of Friends in America. This organization meets as a delegate body every five years and in 1938 consisted of 11 Yearly Meetings, with a membership of approximately 70,000. Its headquarters are in Richmond, Ind. The work of the various departments, such as missions, peace, prohibition and public morals, religious education, is under the direction of executive committees and secretaries of boards. The Five Years Meeting also maintains six colleges for higher education: Earlham, in Richmond, Ind.; William Penn, in Oskaloosa, Iowa; Guilford, in Guilford, N. C.; Wilmington, in Wilmington, Ohio; Whittier, in Whittier, Calif.; and Nebraska Central, in Central City, Neb. Haverford College in Haverford, Pa., is maintained by the Philadelphia Yearly Meeting, Pacific College in Newberg, Ore., by the Oregon Yearly Meeting, and Friends University at Wichita, Kans., by Kansas Yearly Meeting. The latter bodies, however, and the Ohio Yearly Meeting are not a part of the Five Years Meeting. In 1937 the membership of the Oregon Yearly Meeting was 3182; of the Ohio Yearly Meeting, 6070; of Kansas Yearly Meeting, 9111; and of the Philadelphia Yearly Meeting (Orthodox), approximately 4746. *The American Friend*, a biweekly religious journal, is published at headquarters. The next sessions of the Five Years Meeting will occur in October, 1940.

Liberal Branch. This branch was formed in 1827 from a division focused on the preaching of Elias Hicks and the doctrinal issues of the day. It includes six Yearly Meetings federated in the Friends' General Conference, which meets in even-numbered years and conducts work in religious education, social service, and advancement of Friends' principles. The membership in 1938 was 16,505. Publications include the weekly periodical, *Friends' Intelligencer*. The society co-operates with all branches of Friends in supporting the American Friends' Service Committee for work for peace and social justice. Headquarters are at 1515 Cherry St., Philadelphia, Pa.

FRUIT. See HORTICULTURE.

FUTUNA AND ALOFI. See NEW CALEDONIA.

GABUN. See FRENCH EQUATORIAL AFRICA.

GALAPAGOS ISLANDS. See ECUADOR.

GALE, ZONA (MRS. WILLIAM LLEWELLYN BREESE). An American writer, died in Chicago, Dec. 27, 1938. Born in Portage, Wis., Aug. 26, 1874, she was educated at the University of Wisconsin (B.L., 1895; M.L., 1899). After graduation and until 1901, she was a staff member of *The Evening Wisconsin* and the *Milwaukee Journal*.

She then worked on the *New York World* as a reporter, but left in 1903 to do free-lance work. During this period some of her verse appeared in *Smart Set*, and her first published short story appeared in *Success*.

In 1905 she returned to Portage and in 1906 her first novel was issued—*Romance Island*. In the next year she published *The Loves of Pelleas and Etarre*, a collection of short stories. The publication of *Friendship Village* (1908) and *Friendship Village Love Stories* (1909) brought her a wide and loyal public, but it was not until the publication, in 1920, of *Miss Lulu Bett*, a compact bit of sympathetic realism, keen in analysis, warm in humor, and pungent in phrase, that she achieved nationwide popularity. This novel was dramatized in this year and in 1921 was awarded the Pulitzer Prize as the best American play. In 1924, *Mister Pitt*, a dramatization of her novel *Birth*, was produced. Also for the theater, she wrote several one-act plays: *The Neighbors* (1916), *Uncle Jimmy*, *Evening Clothes* (1932), and *The Clouds*.

Miss Gale was a supporter of the LaFollettes and the Progressive-Republican movement, and worked for peace as a member of the Women's International League for Peace and Freedom. During 1923-29 she was a member of the board of regents of the University of Wisconsin, from which she received an honorary degree in 1929, and after 1923 she was a member of the Wisconsin Free Library Commission. On June 13, 1928, she was married to William Llewellyn Breese of Portage.

Her published works included *Mothers to Men* (1911), *Christmas* (1912), *When I Was a Little Girl* (1913), *Neighborhood Stories* (1914), *Heart's Kindred* (1915), *A Daughter of Tomorrow* (1917), *Birth* (1919), *Peace in Friendship Village* (1919), *The Secret Way* (1921), *Faint Perfume* (1923), *Preface to a Life* (1926), *Yellow Gentians and Blue* (1927), *Portage, Wisconsin, and Other Essays* (1928), *Borgia* (1929), *Bridal Pond* (1930), *Old-Fashioned Tales* (1933), *Papa La Fleur* (1933), *Light Woman* (1937), and the biography, *Frank Miller of Mission Inn* (1938). In 1911 her short story, *The Ancient Dawn*, won the Butterick Prize competition.

GAMBIA. A British colony and protectorate in western Africa. Total area, 4068 square miles; total population (1931 census), 199,520. Capital, Bathurst, which had most of the estimated 14,097 inhabitants of the island of St. Mary in 1937. In 1937 there were 6 elementary schools with 1796 pupils, 4 secondary schools with 198 pupils, 1 teacher-training school with 10 students, 1 Mohammedan school, and 1 government boarding school in the protectorate.

Production, etc. Groundnuts, palm kernels, hides, and wax are the main products. Crops grown for local use consist of rice, maize, guinea corn, cassava, and cotton. In 1937 imports (including specie, etc., of £96,551) were valued at £801,716, including £171,346 for cotton piece goods; exports (including specie, etc., of £10,912), £710,060 of which groundnuts accounted for £653,589. The 1937 groundnut crop totaled 67,084 tons. In 1938 a new weekly Imperial Airways service was inaugurated between Bathurst and Freetown, Sierra Leone. In 1937 there were 745 miles of roads.

Government. For 1937 revenue totaled £285,204; expenditure, £243,323; public debt, £38,760. Revenue for 1938 was estimated at £236,038; expenditure, £241,441. The area of the colony (consisting of Bathurst and Georgetown and adjacent land) is 69 square miles, but by an ordinance en-

acted in 1902, all Gambia except the island of St. Mary (4 sq. m.) was placed under the protectorate system of government. A governor assisted by an executive council governs the whole country. The colony also has a legislative council in which the governor acts as president. The protectorate consists of four provinces, each administered by a commissioner responsible to the governor. Governor and Commander-in-Chief, Sir Wilfrid Thomas Southorn (appointed, Mar. 10, 1936).

GAMBIER ISLANDS. See OCEANIA, FRENCH ESTABLISHMENTS IN.

GARBAGE AND REFUSE DISPOSAL. Most striking among events in this field of municipal service was the substitution of the sanitary-fill method of disposal for incineration of a large part of the garbage and refuse of New York City and of Detroit, Michigan. At Detroit the largest of four new incinerators was put into use on February 25 only to be shut down in October. This was soon followed by the closing of a second incinerator. Factors in the closing were the unexpectedly low percentage of combustible refuse, necessitating the purchase of coal, and the high cost of hauling the material. It is unlikely that the larger of the two plants, with a daily capacity of 450 tons, will ever be used again, said the commissioner of public works in the autumn, adding: "It costs us only about 70 cents a ton to bury" the material and "more than \$2 a ton to burn it in the Northwest or largest plant." The cost differential for the two plants remaining in use does not apply because the haul to them is short. In October about 840 tons were being collected, 400 tons buried, and the rest burned. During the winter, with a reduction in amount collected and less favorable conditions for burial it was expected that all the material gathered would be burned in the two other incinerators. Toward the nearly \$1,500,000 cost of the incinerators, 45 per cent was a PWA contribution. For many years the garbage of Detroit was treated by the reduction process under private contract. Reduction was ended on February 27.

New York City has closed several of its incinerators and is using the mixed garbage, ashes, and rubbish formerly burned in them to reclaim marsh lands for park and other purposes. On some areas trenches are dredged, filled with city wastes, and covered with the material dredged out. By using mechanical equipment and systematizing all operations the cost of this method is much less than that of incineration, besides which land otherwise useless, or even a nuisance through mosquito breeding, is reclaimed. In operating the sanitary-fill system skilled engineering control is essential, both sanitary and mechanical. In comparing its cost with incineration the length of haul to the land to be reclaimed and to incinerators must be considered. Important also in new installations are relative capital charges for land and equipment. (See *Engineering News-Record* [New York], Sept. 1, 1938, for illustrated description of New York sanitary fills, and in many following issues letters of comment, mostly favorable, from various American and British cities).

At Rochester, N. Y., an incinerator for readily combustible rubbish was completed. The heat produced is utilized in the city's garbage reduction plant—one of the few such plants remaining in use. Schenectady, N. Y., took bids in August for demolishing its garbage reduction plant and preparing the site for mixed-refuse incinerator. Refuse incinerators which also treat sludge from sewage works are increasing in number. At the close of

the year plans were being drawn for a combined refuse and sludge incinerator for Tonawanda, N. Y., and for a refuse incinerator the heat from which would complete the final stage of sludge drying at Dayton, Ohio. A different combination of garbage and sewage disposal is being provided for Lansing, Mich., where ground garbage goes to the sewage-sludge digestors. (See SEWERAGE AND SEWAGE PURIFICATION.) (For a study of *Effect of Garbage upon Dewatering of Sludge*, made by the Division of Water and Sewage Research, New Jersey Agriculture Experiment Station [New Brunswick], see *Municipal Sanitation*, March, 1938). PWA aid in the construction of garbage and rubbish disposal plants in 1938 was extended to 15 projects estimated to cost \$2,400,000; for the years 1933-38 the figures were 41 plants and \$11,246,000 (all based on official data). These were low totals compared with PWA aid in two other municipal fields (see SEWERAGE and WATERWORKS AND PURIFICATION).

Germany. The German "Four-Year Plan" includes the collection and utilization of garbage for pig feeding, carried on in all municipalities by the "Ernährungshilfs." The plan includes other utilizable house wastes. In cities which incinerate certain wastes the residue of slag is utilized. (See *The Turning to Account of Refuse in Germany*, in *Journal Institute of Public Cleansing* [London], October, 1938.)

GARNER, JAMES WILFORD. An American historian, died at Champaign, Ill., Dec. 9, 1938. Born in Pike Co., Mississippi, Nov. 22, 1871, he was educated at the Mississippi Agricultural and Mechanical College (B.S., 1892). After graduation he taught in Mississippi high schools until 1896 and subsequently at the Bradley Polytechnic Institute. He received the degree of Ph.M. at the University of Chicago in 1900 and then went to New York where he became associated with Columbia University as university fellow in political science and public law, 1900-01, as George Curtis William fellow, 1901-02 (Ph.D., 1902), and as lecturer in history, 1902-03. He then joined the faculty of the University of Pennsylvania as an instructor in political science, and in 1904 accepted the post of professor of political science at the University of Illinois, which he held at his death.

Dr. Garner was Hyde lecturer at various French universities in 1921, Tagore lecturer at the University of California, 1922, Stokes lecturer, New York University, 1926, professor at the Institut des Hautes Études Internationales, Geneva, 1928-29, visiting professor of the Carnegie Endowment for International Peace at English and French universities, 1929, and lecturer at The Hague Academy of International Law in 1923 and again in 1931. An authority on international law, he served as president of the Institut Internationale de Droit Public during 1935-36 and as president of the American Political Science Institute in 1924.

Besides contributing to the NEW INTERNATIONAL ENCYCLOPEDIA, the *Encyclopædia Americana*, the *Encyclopædia of American Government*, and the *Encyclopædia of the Social Sciences*, he was collaborator on the *French Revue Politique et Parlementaire* during 1903-14; editor-in-chief of the *American Journal of Criminal Law and Criminology* during 1910-11, and from 1924 was associate editor of the *American Journal of International Law*. He wrote *Reconstruction in Mississippi* (1901); *History of the United States* (4 vols., 1906) with Henry Cabot Lodge; *Introduction to Political Science* (1910); *American Government*

(1911); *Civil Government for Indian Students* (1920); *Idées et Institutions Politiques Américaines* (1921); *International Law and the World War* (2 vols., 1920); *Recent Developments in International Law* (1925); *Prize Law during the World War* (1927); *American Foreign Policies* (1927); *Political Science and Government* (1927); *Law of Treaties* (1935), and edited *Essays on Southern History and Politics* (1914) and translated Brissaud's *History of French Public Law*.

Dr. Garner received honorary degrees from the Universities of Calcutta and Lyons and from Oberlin College, and in 1925 was made a chevalier of the French Legion of Honor.

GAS. From a preliminary report furnished by the American Gas Association, manufactured and natural gas companies supplying towns and cities with a population of 81,000,000 served a total of 17,135,000 customers, representing the largest number of consumers ever connected to the mains of the industry, and an increase of 180,000 over the year 1937. Of these, 9,988,000 were served by the manufactured gas industry and the remaining 7,147,000 by the natural gas industry. Preliminary estimates indicate that revenues of the entire industry, both manufactured and natural, aggregated \$786,576,000 in 1938, a decrease of 1.8 per cent from the preceding year. The manufactured gas companies grossed \$367,714,000, a gain of 2.2 per cent for the year, while revenues of the natural gas companies were \$418,862,000 as compared with \$441,232,000 in 1937, a decrease of 5.1 per cent.

Manufactured. Sales of manufactured gas for domestic uses, other than house heating, such as cooking, refrigeration, water heating, etc., amounted to 198,331,000,000 cu. ft., an increase of 1.5 per cent for the year. The gain in house-heating sales amounted to 10 per cent. This would doubtless have been larger except for the mild temperatures that prevailed throughout the year in most sections of the United States. Sales of manufactured gas for industrial and commercial purposes in 1938, a year of marked industrial recession, were about 1 per cent above the previous year. Details of sales and revenue are given in the following table.

	1938	1937	Per cent change
Gas Sales (M cu. ft.):			
Domestic	198,331,000	195,400,000	+ 1.5
House Heating ..	50,164,000	45,600,000	+ 10.0
Industrial and Commercial	108,507,000	107,433,000	+ 1.0
Miscellaneous ..	2,243,000	2,130,000
Total	359,245,000	350,563,000	+ 2.5
Revenue (Dollars):			
Domestic	260,963,000	256,853,000	+ 1.6
House Heating ..	31,964,000	28,539,000	+ 12.0
Industrial and Commercial	73,242,000	73,093,000	+ 0.2
Miscellaneous ..	1,545,000	1,480,000
Total	367,714,000	359,965,000	+ 2.2

Natural. Preliminary estimates indicate that the total production of natural gas in 1938, including amounts used in the manufacture of carbon black and for field purposes, reached an all-time high of more than two and one-half trillion cubic feet, or more than 2 per cent above the previous peak established in 1937. Approximately 173 billion cubic feet of natural gas were used as fuel for generating electric power in 1938; this was an increase of nearly 2 per cent over the previous year. Industrial sales of natural gas declined 15 per cent from 1937. The sales of natural gas for domestic

uses, which are influenced to a considerable extent by temperature variations, registered a decrease, falling from 359,294,000,000 cu. ft. in 1937 to 350,143,000,000 in 1938, a loss of 2.5 per cent. Details of sales and revenue are given in the table below.

	1938	1937	Per cent change
Gas Sales (M cu. ft.):			
Domestic (Incl. House Heating)	350,143,000	359,294,000	- 2.5
Commercial	99,459,000	102,654,000	- 3.1
Industrial	581,451,000	681,978,000	-14.7
Electric Generation	172,500,000	170,567,000	+ 1.1
Total Ind. & Elec. Generation	753,951,000	852,545,000	-11.6
Total	1,203,553,000	1,314,493,000	- 8.4
Revenue (Dollars):			
Domestic (Incl. House Heating)	244,063,000	246,546,000	- 1.0
Commercial	47,381,000	48,152,000	- 1.6
Industrial & Electric Generation	127,418,000	146,534,000	-13.0
Total	418,862,000	441,232,000	- 5.1

GENERAL EDUCATION BOARD, THE.

An institution incorporated by an Act of Congress in 1903, with the stated object of "promoting education within the United States of America, without distinction of race, sex, or creed." Mr. John D. Rockefeller's gifts to the General Education Board, together with smaller gifts from other sources, amounted to approximately \$179,754,000. The Board is empowered to expend the principal as well as the income from these funds. The present program is restricted largely to three types of activity: First, the continuance of the existing program in the Southern States; second, the support of research and experimentation in relation to the problems presented in the field of general education, i.e. the secondary school through the junior college level; and third, a program, now coming to a close, in child growth and development. At the end of the year 1937, the unappropriated assets amounted to \$28,000,000, of which the major portion was definitely earmarked for programs already undertaken, leaving a free balance of funds of about \$8,700,000. See UNIVERSITIES AND COLLEGES.

During the year ended Dec. 31, 1938, appropriations approximating \$7,350,000 were made for purposes within the present program of the Board and to bring to a close certain other undertakings under previous programs. Some of the larger grants were made for the following projects: American Council on Education, for conferences, studies, and research, \$695,500; the Tulane University of Louisiana, for endowment of its school of medicine, and for cataloguing additions to the university library, \$461,000; for fellowships, \$215,000; Progressive Education Association, for its service program and researches, \$203,120; University of California, for a child guidance study in its Institute of Child Welfare, \$190,000; Meharry Medical College, toward the expenses of its school and hospital, \$160,000; state departments of education in Southern States, for traveling expenses and salaries of state agents for rural schools for Negroes, \$140,000; Louisiana State University and Agricultural and Mechanical College, for teaching and research in agricultural economics and rural sociology, \$94,000; Atlanta University, for improvement of the plant of Morris Brown College, \$90,000; Southern Association of Colleges and Secondary Schools, for a summer workshop and for its Commission on Curricular Problems and Research, \$89,500; University of North Carolina, for its Institute for

Research in the Social Sciences, \$87,000; Yale University, for its Clinic of Child Development, \$85,000; Williamsburg (Virginia) Public Schools, for school and community service for Negroes, \$77,000; University of Virginia, for its Mountain Lake Biological Station, and for recataloguing the university library, \$75,000; Tuskegee Normal and Industrial Institute, for research, plant improvements, and maintenance items, \$61,595; University of Minnesota, for the educational program in the General College, \$56,000; Fisk University, for current expenses, \$55,000; Leland Stanford, Junior, University, for its experimental program in the social studies, \$55,000; Baylor University, Waco, Texas, for books and scientific equipment, \$50,000.

The executive officers of the General Education Board during 1938 were: John D. Rockefeller, Jr., chairman of the board of trustees; Raymond B. Fosdick, president; David H. Stevens (resigned, June 30) and Albert R. Mann, vice-president; William W. Brierley, secretary; Lefferts M. Dashiell (died, February 28) and Edward Robinson, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel; Chauncey Belknap, associate counsel; Albert R. Mann, director for Southern education; Robert J. Havighurst, director for general education. The offices of the Board are at 49 West 49th Street, New York City.

GENETICS. See BOTANY; ZOOLOGY.

GEOGRAPHICAL SOCIETY, AMERICAN.

An organization founded in 1852 and today the leading institution in the United States devoted primarily to the promotion of geographical research. At its headquarters in New York City the Society maintains a research staff engaged in original investigations and in the preparation, editing, and publishing of books, maps, and a quarterly journal. The scholarly and scientific quality of these publications is generally recognized and may be attributed, in part at least, to the fact that the Society possesses what is probably the richest collection of selected geographical books and maps in the country (open to the public). The Society encourages such exploring expeditions as seem likely to yield valuable discoveries in geography and related sciences and co-operates with other institutions with respect to the geographical aspects of their research and exploration projects. It participates in numerous studies that have wide practical application and that represent the fulfillment of its obligation as a national institution to concern itself with the national welfare and the problems of society. Lectures by distinguished explorers or geographers are sponsored annually and important contributions to the development of geography are recognized through elections to honorary and corresponding memberships and the bestowal of medals.

The Society's outstanding project of research during the past 18 years has been the compilation and publication of a 107-sheet map of Hispanic America, conforming to the International Map of the World on the scale of 1:1,000,000. This great undertaking is now approaching completion.

The Society's Cullum gold medal for 1938 was presented to Louise A. Boyd, in recognition of her achievement in Arctic geographical research, and the Charles P. Daly gold medal was presented to Dr. Alexander Forbes of Harvard Medical School in "recognition of his outstanding work in conducting a geographical survey of Northern Labrador." On Dec. 20, 1938, Dr. John K. Wright was appointed director of the Society to succeed Dr. Isaiah Bowman.

The four numbers that make up the 1938 volume

of the *Geographical Review*, the Society's journal, contain articles by prominent geographers, explorers, and distinguished scientists in related fields, dealing with such widely varied topics as "Soil and Water Conservation in the Punjab," "Catalonia: The Geographical Basis of Its Regionalism," "Racial Maps of the United States," "Who Named Mount Washington?" "The Origin and Growth of the Brazilian Network of Towns," "The Economic Regions of Germany," "Contrasts in African Farming." Two new volumes were added to the Society's *Special Publication Series* in 1938: *Rainfall and Tree-Growth in the Great Basin* by Dr. Ernst Antevs (published jointly by the Society and the Carnegie Institution of Washington), and *Northernmost Labrador Mapped from the Air*, by Dr. Alexander Forbes, O. M. Miller, and others. In the preparation of the maps that accompany the latter volume a new technique, developed at the Society, was employed. At the beginning of the year a new publication entitled *Current Geographical Publications* was launched. Issued in mimeograph form once a month (except for July and August), it lists books, maps, and articles in periodicals received by the Society's library. Early in 1939 another volume in the *Special Publication Series* will be published, by Dr. A. Grenfell Price on the subject of white settlement in the tropics.

The president of the Society in 1938 was Roland L. Redmond. Headquarters are at Broadway and 156th Street, New York City.

GEOGRAPHIC SOCIETY, NATIONAL. An organization for the "increase and diffusion of geographic knowledge," founded in 1888 at Washington, D. C., since 1899 directed by Gilbert Grosvenor, now President of the Society and Editor of its *National Geographic Magazine*.

During its 50 years the membership of the Society has grown to an enrollment of 1,100,000 members, and its official publication, the *National Geographic Magazine*, has become world famous for its beautiful illustrations, comprehensive articles, and accurate maps. The Society has sponsored many notable explorations and scientific expeditions.

Through the half century the Society has presented to its membership, in the *National Geographic Magazine*, personal narratives of these and other expeditions, and has amassed more than 250,000 photographs which constitute an unparalleled pictorial record of world geography.

In 1938 Bradford Washburn, conducting the Harvard University-National Geographic Society Alaskan Expedition, discovered a giant ice field filling vast valleys at an altitude of 5000 to 7000 feet. The ice sheets lie in the region of the Chugach and Saint Elias mountain ranges near the junction of the Alaskan panhandle and Alaska proper, covering an irregular area 235 miles long. The region was photographed as an aid to later mapping.

A three-year research program was started in 1938 by the Society in co-operation with Cornell University to determine the precise cause of the aurora borealis or "northern lights." Visual and photographic observations will be made by observers in the United States and Canada. The observations will cover time of occurrence, frequency, form, and intensity of aurorae at various points, measurement of heights, and spectrographic data.

Capt. C. W. R. Knight made a day-to-day photographic record of the nesting habits of a pair of fierce crowned eagles while serving as leader of the Society's 1937-38 South African Expedition. Wendell Chapman conducted an expedition in the

northern Rocky Mountain region to study small mammals and birds. The expedition will carry on studies in other sections of western United States and Canada.

The Franklin L. Burr Prize of \$1000 was awarded Dr. and Mrs. William M. Mann, leaders of the National Geographic Society-Smithsonian Institution biological expedition in the Netherlands Indies in 1937. The shipload of 800 birds and animals collected by Dr. Mann was presented to the National Zoological Park at Washington, D. C.

Charles Bittering, the artist who accompanied the National Geographic Society-U.S. Navy Expedition to observe the June 8, 1937, eclipse, continued his work on paintings of the phenomena. His canvasses show the striking colors of the incandescent gases of the promontories near the disk of the sun and the delicate tints of the corona which extended outward more than a million miles from the sun's surface. This eclipse was the longest total solar eclipse in more than a thousand years.

The Society published a 34 by 39 inch map supplement, in 10 colors, of the Mediterranean and Europe, showing the present status of Austria as a part of the German Reich and other recent political changes; a 26 by 31 inch pictorial map of the "Reaches of the Nation's Capital," and a 25 by 35 inch map of "Bible Lands and the Cradle of Western Civilization." This map of the Near East shows the historic development of Bulgaria, Greece, Turkey, Iran, Iraq, the Levant States, Palestine, Trans-Jordan, Saudi Arabia, Egypt, and Kuwait. It marks places of importance in Bible Days, the Roman Era, the Middle Ages, and Modern Times.

In addition to the *National Geographic Magazine*, the Society published the *Book of Birds*, edited by Dr. Gilbert Grosvenor and Dr. Alexander Wetmore, the first comprehensive work containing illustrations in color of all the major species of American birds north of Mexico.

GEOGRAPHY. See ANTHROPOLOGY; EXPLORATION; POLAR RESEARCH.

GEOLOGY. Penrose Medal. For 1938 the Penrose Medal, highest honor of the Geological Society of America, was awarded to Dr. Andrew Cowper Lawson, professor emeritus of geology at the University of California, "for eminent research in pure geology and outstanding original contributions and achievements which make a decided advance in the science of geology." Dr. Lawson is an authority on earthquake phenomena and has published major contributions on the geology of numerous areas in the United States and Canada. He has also devoted much attention to the theoretical aspects of diastrophism and isostasy. The award was made at the annual dinner of the Society at the Waldorf-Astoria Hotel, New York City, December 30.

No award of the Penrose Medal was made for 1937, and since the award to Dr. Lawson in 1938 was for work done a number of years previously, the omission in 1937 must be ascribed to the regrettable inability of the Award Committee to agree upon a suitable recipient. Since many older American geologists, fully worthy of this award, have not yet been thus signally honored, it is to be hoped that the award will not be omitted for a number of years, lest some of these men pass from the scene unnoticed. Previous recipients of the medal have been: Thomas C. Chamberlin, 1927; Jakob J. Sederholm, 1928; François A. A. Lacroix, 1930; William M. Davis, 1931; Edward O. Ulrich, 1932; Waldemar Lindgren, 1933; Charles Schu-

chert, 1934; Reginald A. Daly, 1935; and Arthur P. Coleman, 1936.

Roebbling Medal. This medal of the Mineralogical Society of America was awarded for the year 1938 to Dr. Waldemar T. Schaller of the U.S. Geological Survey. Awarded for "Meritorious Achievement in Mineralogy and Allied Sciences," it was established in memory of Col. Washington A. Roebbling, the famous builder of bridges, and was first awarded in 1937. Dr. Schaller has been a member of the U.S. Geological Survey for 35 years in which time he has published many original contributions including papers describing more than 40 new mineral species. Dr. Schaller has done much work on the potash deposits of New Mexico and Texas, on the crystal cavities of the trap rock region of the Watchung Mountains of New Jersey, on pegmatite minerals, and is a widely known authority on rare and unusual minerals.

Section E (Geology and Geography) A.A.A.S. Section E (Geology and Geography) of the American Association for the Advancement of Science held a joint meeting with the Geological Society of America at Ottawa, Canada, from June 27 to 30, inclusive. An unusually interesting program was arranged by the Section secretary, Prof. Howard A. Meyerhoff of Smith College, with the co-operation of Walter A. Bell representing the Canadian Geological and Geographical organizations. Prof. Kirtley F. Mather of Harvard University is the retiring Vice-President, while Prof. Walter H. Bucher is Vice-President and Chairman of Section E. Following the sessions in Ottawa several field trips were held, of which those to Madoc, the Ottawa Lowland, and the Mining Districts of Ontario were particularly noteworthy.

The winter meeting of Section E took place at Richmond, Va., from December 27 to 29, in joint sessions with the Carolina Geological Society, the American Geophysical Union, and Sections A (Mathematics) and D (Astronomy) of the American Association. One of the finest programs arranged in recent years included sessions devoted to: Geology of the Coastal Plain and Continental Shelf; the Importance of Geophysics to the Study of Continental Borders; the Life and Work of William Barton Rogers; Current Geological Research in the Piedmont and Central Appalachians; Meteorites and Meteorite Impacts; and Geography and Geomorphology of Virginia and the Carolinas. In conjunction with these meetings the addresses of W. D. Cairns, Retiring Vice-President and Chairman of Section A, entitled, "Seismology from the Mathematical Viewpoint"; and that of Kirtley F. Mather, Retiring Vice-President and Chairman of Section E, entitled, "Earth Structure and Earth Origin," were given.

Prof. Kirk Bryan of Harvard University was elected Vice-President and Chairman of Section E for 1939.

Society of Economic Geologists. The Society of Economic Geologists met with the American Institute of Mining and Metallurgical Engineers in New York in February, 1938, but held no meetings in conjunction with the annual meeting of the Geological Society, although many geologists are members of both societies. During 1938 Prof. Donald McLaughlin of Harvard University was president of the Economic Geologists and his presidential address is scheduled to be given at the New York meeting of the Society, again with the mining engineers, in February, 1939. Dr. A. C. Veatch was elected president of the Society for 1939 but died before assuming office, and Prof. E. S. Moore

of the University of Toronto was elected to fill the term of Dr. Veatch. The Penrose Medal of the Society of Economic Geologists for 1938 was awarded to Reno H. Sales, chief geologist of the Anaconda Copper Mining Co.

International Geographical Congress, FIFTEENTH SESSION. Section IIa of the Fifteenth Session of the International Geographical Congress Meeting at Amsterdam from July 18 to 28 was devoted to geomorphology. Special consideration was given to the problems of glacial erosion, piedmont treppen, and terminal moraines, all subjects of geologic interest, and there were 32 papers in these fields. In addition the section met in joint sessions with the "Commission pour la cartographie des surfaces d'aplanissement tertiaires" and the "Commission pour l'étude des terrasses pliocènes et pleistocènes" of the International Geographical Union. Among subjects proposed for special discussion at the next Congress were (1) Studies of the morphological effects of running water, (2) study of recent processes of surface denudation in all climates, (3) forms of glacial erosion and deposition with reference to present-day glaciers, (4) morphology of sub-arid and arid regions, and (5) the importance of the wind as a morphological agent. The members of Section IIa seemed to show great unanimity in recognizing that future geomorphic work must pay much more attention to denudational processes than in the past. For this increasing knowledge of physics and mechanics will be required.

International Geological Congress, EIGHTEENTH SESSION—GREAT BRITAIN—1940. During the summer appeared the first announcement of the Eighteenth Session of the International Geological Congress, which is to be held in Great Britain in July and August, 1940. This is the first meeting of the Congress to be held in Great Britain since 1888, and judging from the many expressions of satisfaction which have been heard the selection of this meeting place is popular, and a large attendance is assured unless war or widespread economic depression interferes.

The general sessions of the Congress will be held in London from July 31 to August 8, where papers pertaining to the following subjects particularly will be formally presented.

1. Magmatic Differentiation; 2. Metasomatic Processes in Metamorphism; 3. Caledonids in Northwest Europe; 4. Rhythm in Sedimentation; 5. The Geology of Iron-Ore Deposits; 6. The Geology of Coal Seams; 7. The Geology of Petroleum; 8. The Geology of Sea and Ocean Floors; 9. The Stratigraphical Limits of the Ordovician System; 10. The Pliocene-Pleistocene Boundary; 11. The Distribution of Early Vertebrates; 12. Faunal Facies and Zonal Correlation; 13. Earth Movements and Evolution; 14. The Geological Results of Applied Geophysics.

As usual field excursions are being planned to take place before, during, and after the Congress. Since most geologists attending the Congress look upon the field excursions as by far the most important feature of each session, they are outlined below:

A. Excursions before the Congress:

1. The West Highlands and Islands of Scotland (most systems from Pre-Cambrian onwards; Caledonian tectonics; Devonian and Tertiary igneous phenomena). 21 days approximately; by steamer or equivalent motor-coach transport.
2. The North of England, including the Lake District (mainly Lower Palaeozoic). 14 days approximately.
3. The Pennines (Carboniferous). 8 days approximately.

4. South Wales and the Bristol district (mainly Palaeozoic). 10 days approximately.
5. The Isle of Wight and Dorset (Mesozoic and Tertiary strata; tectonics). 12 days approximately.
6. Economic deposits (coal, ironstone, cement materials, slate, brick-earth, gypsum, etc.). 10 days approximately.
7. Cornwall and Devonshire (mineralogical). 7 days approximately.

B. Short excursions during and near the dates of the General Sessions, details of which will appear later.

C. Excursions *after* the Congress:

1. A general excursion through England. 14 days approximately.
2. The Northeast of Ireland and Dublin district (Pre-Cambrian to Tertiary), arranged in conjunction with representatives of Eire. 14 days approximately.
3. The East Coast of the Scottish Highlands (metamorphic rocks, Caledonian intrusions, Old Red Sandstone). 8 days approximately.
4. The Lowlands of Scotland (Ordovician to Carboniferous strata; volcanic and intrusive igneous rocks). 8 days approximately.
5. The Midlands, Yorkshire, Cumberland, Lancashire, North Wales (glacial geology). 10 days approximately.
6. North and Central Wales and the Welsh Border (mainly Lower Palaeozoic). 14 days approximately.
7. South Wales and the Bristol district (Carboniferous). 7 days approximately.
8. Devon and Cornwall (Hercynian Chain, granites, mineral veins). 10 days approximately.
9. East Anglia (with emphasis on the Mesozoic and Pliocene rocks). 7 days approximately.

It is expected that the cost of the excursions will vary from five to eight dollars per day. Membership in the Congress is open to anyone legitimately interested in geology and related sciences. Inquiries should be addressed to the General Secretaries, Eighteenth Session, International Geological Congress, Geological Survey and Museum, Exhibition Road, South Kensington, London, S.W.7.

Some of the subjects announced for discussion may be broad enough to allow the inclusion of geomorphic papers, but it is interesting to note that neither in the general sessions nor in the excursions is specific provision made for the geologist who is primarily a geomorphologist. In Great Britain where the relationship between structure and topography is shown so beautifully and in such varied forms, this seems regrettable, and it is to be hoped that an excursion or two may yet be arranged for the considerable number of geomorphologists, who will undoubtedly attend the Congress.

Geological Society of America. The Semi-Centennial Anniversary of the Geological Society of America was celebrated at the Waldorf-Astoria Hotel in New York City on December 28, 29, 30 during the Fifty-first Annual Meeting of the Society. This, the third meeting to be convened in New York City in 11 years, was probably the largest and most elaborate ever held by the Society. In addition to the Geological Society, the Paleontological Society, the Mineralogical Society of America, and the Seismological Society of America held sessions in conjunction with the three-day program.

During 1938 Dr. Arthur L. Day, who retired recently as director of the Geophysical Laboratory of the Carnegie Institution, served as president. To succeed him in 1939, Dr. T. Wayland Vaughn, emeritus Professor of Oceanography at the University of California and emeritus director of the Scripps Institution at La Jolla, Calif., was elected. Dr. J. Ellis Thomson of the University of Toronto served as president of the Mineralogical Society of America in 1938 and is succeeded as president for 1939 by Dr. Maxwell Naylor Short of the University of Arizona. Prof. Ralph W. Chaney of the University of California was elected president of

the Paleontological Society of America for 1939 to succeed Dr. C. W. Gilmore of the United States National Museum, who served in 1938.

The Geological Society of America was founded at Cornell University in 1888; it was developed by successive steps from the Association of American Geologists, founded in 1840, which in 1843 became the Association of American Geologists and Naturalists. Starting with a list of 112 original fellows, of whom six, Nelson H. Darton, Herman L. Fairchild, William F. E. Gurley, Robert T. Hill, Frederic W. Simonds, and Edward O. Ulrich, are still living, it has expanded gradually to its present list of fellows numbering about 700. Within the last decade the influence of the Society has been tremendously increased by the munificent R. A. F. Penrose Bequest of over four million dollars establishing a permanent endowment for the support of publication, research, and public education.

To date the income of the Penrose Fund, which has been administered from the Geological Society House, 419 West 117th St., New York, N. Y., has been largely devoted to the support of a great number of individual research programs, carried out both by member and non-member geologists, and to the publication of the results of these and other researches. Thus far, 258 grants for such research projects have been made. Most of these are for amounts of less than \$1000, but one grant was for \$24,000, while 19 have been for amounts of \$3000 or more. In 1938 a total of 4859 pages of material was published, distributed as follows: *The Bulletin*, the monthly magazine of the Society, 2000 pages; *Proceedings*, the reports of meetings and business of the Society, 388 pages; *Bibliography and Index of Geology Exclusive of North America*, 510 pages; *Special Papers and Memoirs*, monographic reports on larger studies, 1691 and 270 pages respectively.

In allocating funds for research the Geological Society has purposely left to the individual applicants the initiation of such researches and has been as generous in grants to small isolated undertakings as to larger and apparently more important ones. Recently this policy has been questioned, and a committee under the chairmanship of Prof. Nevin M. Fenneman of the University of Cincinnati has been appointed to canvass the entire field of geologic science to discover or point out the possibilities of different lines of research and to recommend the most promising ones for development now.

At the annual meeting of the society the election of two foreign correspondents, Prof. H. A. Brouwer, Geological Institute, University of Amsterdam, and Prof. Hans Cloos, Geological and Paleontological Institute, University of Bonn, and 43 fellows was announced. During the year the deaths of seven fellows and one correspondent, Giuseppe Stefanini, occurred. Of the fellows, Frank B. Taylor, famous for his work upon the glacial geology of central North America and for his early suggestions concerning continental drift, and Arthur C. Veatch, well known for his work in petroleum geology and more recently for studies of submarine topography, were probably the best known.

During the annual smoker of the society the address of Dr. Day, the retiring president, entitled "The Hot Springs Problem," was given, and at the annual banquet the Penrose Medal was presented to Professor Lawson. During the meetings, Dr. Ellis Thomson, retiring president of the Mineralogical Society of America gave an address: "A History of the Study of Ore Minerals," and Dr. C. W. Gilmore, retiring president of the Paleontological

Society, delivered an address: "Review of Recent Progress in Reptilian Paleontology." These addresses will be published in the Bulletin of the Geological Society.

Field Conferences in Geology. One of the most significant features indicating the continued vitality and even growth of interest in geologic studies is the increasing number of annual field trips arranged by state and regional associations of geologists. Some of these field-study groups have been holding annual meetings for many years as instanced by the New England Intercollegiate Geological Conference; others have but recently been organized as is the case in the Carolina group. Scarcely a section of the more thickly populated areas is now without some such organization, so that most serious students of geology, whether professional or amateur, find it possible to meet kindred spirits at least once a year for a couple of days devoted to field study of their favorite subject. Anyone genuinely interested in geology is usually welcome at these conferences, and the groups commonly consist of a greater proportion of students, usually graduate, than of professional geologists. The permanent organization is rather loose, but a great amount of time and energy is devoted by the local committees in charge of guiding the visitors to their area in assuring a most instructive and entertaining weekend to their guests. These meetings are not necessarily held at any educational center but rather at a region of especial geologic interest, and the guides chosen are those people best acquainted with the local geology. The list of organizations holding such annual field meetings is much too long to be enumerated here.

Journal of Geomorphology. During the year Vol. I of this new quarterly *Journal*, the first in the English language to be devoted to the study of the surface features of the earth, appeared. It is edited by Douglas Johnson and published by the Columbia University Press. Averaging 96 pages in length, each number of the magazine contains in addition to the usual scientific papers, sections devoted to Editorials, Notes on Maps, Reviews and Abstracts, Studies in Scientific Method, and Current Notes on Geomorphology. Although it closed the first year with an encouraging list of nearly 400 paid subscribers, it is expected to incur an annual deficit for several years at least and is published with the financial support of the James Furman Kemp Memorial Fund of Columbia University.

Submarine Canyons. During the past few years the sonic depth finder has so increased the rapidity and ease with which submarine topography can be determined that it is perhaps not too much to say that charts of the continental shelf and slope can now be made approaching, if not equaling, ordinary topographic maps in accuracy. This has added greatly to the knowledge concerning submarine canyons, and interest in these puzzling features has increased greatly. In brief, it may be said, as pointed out by Shepard, that most of the canyon floors possess a continuous seaward gradient; that canyons with lowest gradients occur offshore from major rivers; that the steepest canyons are located off continental and oceanic islands; that the canyons of the Atlantic slope of North America are steeper in gradient than those of the Pacific; that most canyons are located at the mouths of rivers; and that they seem to be world-wide in occurrence. This group of facts and others which might be mentioned suggest that the canyons were cut as subaerial features when the ocean stood lower than now. According to Veatch, the lowest point

to which a submarine canyon can be traced is off the coast of Africa, where the Canyon of the Congo can be found to 12,000 feet below sea level. The famous canyon of the Hudson River, cut below the continental shelf south of New York City, is of a similar order of magnitude. Obviously, if these are subaerial in origin, the continents must have stood 12,000 feet higher with reference to sea level than at present, and probably not so long ago, since the canyons have not been filled. Lacking other corroborative evidence, many geologists have been loathe to accept such a great relative shift in sea level, for no one has been able to suggest more than a couple of thousand feet lowering of sea level due to water held up in glaciers during the Pleistocene.

Various other explanations, ably reviewed by Johnson in current issues of the *Journal of Geomorphology*, have been proposed by those attempting to escape from the varied implications of the subaerial hypothesis. The most popular alternate hypothesis seems to be the turbidity current theory supported by Daly, in which a submarine current of water of greater specific gravity than usual, due to its mud content, is required to cut the canyon, while, as at present, they were below sea level.

In addition to increased knowledge concerning submarine topography, knowledge concerning the geology of the canyons and the continental shelf has increased somewhat. Through an ingenious invention by which an explosion drives a core-taking instrument into the mud of the continental shelf it has been made possible to get samples of loose material from depths as great as 10 or 12 feet below the surface. This has not aided much in solving the question of canyon origin, but by means of fragments of rock brought to the surface by the dredges of fishermen and by dredging exploration something has been learned concerning the age of the bedrock floors and walls of the canyons. The age of some of these hard-rock fragments has been closely determined by their fossil content, and a limiting maximum age for the canyons thus established. It is certain that should the canyons prove finally to be subaerial, it will greatly change many more or less established theories of geology.

Meteor Craters. The origin of meteor impact craters continues to attract geologists as evidenced by a number of papers on the Carolina Bays country. The Bays, numerous, oval, shallow, depressions in the Carolina Coastal Plain, have been accepted by many geologists as of meteoritic origin. Geophysical studies seem to bear out this contention in showing magnetic highs at expectable positions for the buried meteorites, but the apparent restriction of the Bays to the Coastal Plain seems to suggest a terrestrial origin. The problem may be regarded as still unsettled.

Meteor Crater (Coon Butte), Arizona, remains the world's outstanding example of an impact crater and has been so accepted by most geologists and astronomers. Many efforts to mine the iron supposedly buried here have failed and as Lundberg has recently shown by geophysical methods the masses of iron are apparently to one side of and not beneath the crater. This is attributed to the angle of impact having been at 30 degrees to the horizontal rather than vertical. It is stated that the new information gained by geophysical methods will be the basis of renewed efforts to make economic recovery of this unusual iron deposit.

Mammoth Remains. Of considerable interest, but not greatly significant, was the announcement by Soviet scientists of the finding of a mammoth

carcass, whole and entirely preserved, within the solidly frozen soil of Wrangel Island. Mammoth and mastodon bones are frequently found, but the occurrence of refrigerated carcasses seems to be restricted to Siberia. There is no reason that they should not occur, however, in northern North America. One such body is preserved in the Natural History Museum in Leningrad and is the subject of pilgrimage by visiting geologists. The new find will be brought to civilization by a special expedition equipped with a refrigerator, but it is doubtful whether it will tell much more than is known already about this extinct beast of the Pleistocene.

Bibliography. Among publications appearing during 1938, the following may be particularly worthy of mention:

Landslides and Related Phenomena, by C. F. S. Sharpe (New York, Columbia University Press, 1938). This thoughtful and well-prepared modern discussion of landslides and other mass-movements of soils and surficial materials contains a novel classification. Quite evidently it is based upon adequate field work and scholarly knowledge of the literature in its field. It contains a useful bibliography and should be found in all reference libraries of geology and geography.

Physiography of Eastern United States, by Nevins M. Fenneman (New York, McGraw-Hill, 1938). This long-awaited companion to its author's *Physiography of Western United States*, which appeared in 1931, is a most important contribution to the knowledge of the regional geology and geography of the United States. Slightly over 700 pages in length it becomes at once an indispensable reference and guide in its field. The twelve major geomorphic provinces of the United States east of the Great Plains are treated in 13 chapters replete with photographs, diagrams, maps, and reference to original sources.

Die Oberflächengestaltung Finnlands, by Victor Tanner (Helsingfors, Centraltryckeri Och Bokbinderi A. B., 1938). An abundantly illustrated and authoritative account, over 700 pages in length, by a Finlander, of the geomorphology and topography of Finland, that most interesting neighbor of the Scandinavian countries, which shares with them many features of geographic and geologic interest. A long bibliography is appended.

Practical Seismology and Seismic Prospecting, by L. Don Lee (New York, D. Appleton-Century, 1938). A discussion of earthquakes, natural and artificial, written with the minimum of theory and with the point of view of those having little mathematical training always in mind.

Structural Petrology, by Eleanor Bliss Knopf and Earl Ingerson (New York, Geological Society of America, 1938). The first detailed exposition in English of the theory upon which the subject of structural petrology (Gefügekunde) or petrofabrics is based. This method of studying major geologic structures by means of the orientation and character of the constituent minerals of the rock as seen in thin section was developed by Sander in Austria and is now attracting wide attention. Several chapters upon laboratory technique are the contribution of Earl Ingerson, a former student of Sander.

Architecture of the Earth, by Reginald Aldworth Daly (New York, D. Appleton-Century, 1938). A book, much of which will be comprehensive to the educated layman, summarizing particularly 20th-century advances in geologic discovery and thought. Much attention is paid to the new handmaidens of geology, geophysics, and geochemistry, and many new possibilities as to the origin of earth forces and structures are presented.

Lexicon of Geologic Names of the United States, (two volumes), by M. Grace Wilmarth (Washington, U.S. Geological Survey, 1938). This useful reference mentions the initial paper and later articles, if any, in which the stratigraphic units of the United States have been originally defined and later modified. In addition abstracts or excerpts from the source papers are given together with other pertinent remarks as to age, locations, subdivisions, etc., of the formations listed.

Das Relief der Erde, Erster Band, written by Fritz Machatschek (Berlin, Gebrüder Borntraeger, 1938). In this volume is discussed the regional geomorphology of all of Europe, of Siberia, Central, and Eastern Asia, and of the Alpine folded region of North Africa. The regional subdivisions are based very largely on structure, and many structural and geomorphic maps contribute in making this a useful reference or text on the areas described.

Recognition and Significance of Multiple Erosion Surfaces, by John L. Rich (*Bulletin of the Geological Society of America*, vol. xlix, November, 1938). Rich questions the existence of the multiple erosion surfaces described in a number of recent papers, and, if they do exist, questions their explanation as products of repeated partial pene-

planation. Much of the evidence for these surfaces such as the elevations of ridge crests, isolated hilltops, and spurs is inadequate and unsafe, and more attention should be paid to the correlation between surface form and rock resistance. Theoretical considerations oppose the occurrence of several cycles, beyond maturity, at the same time in a region of uniform rock resistance. The burial and resurrection of marine surfaces or of pediments or of more ancient unconformities may explain many of the supposed "levels." It is argued that the Rocky Mountain upland may better be explained as a single surface of varied origin rather than as 10 or 15 surfaces of different age developed as the result of an equal number of partial stream cycles. Rich believes it possible that the topography of the Appalachian Mountain region may be explained by a single-cycle interpretation taking into account differences in rock resistance.

Preparation of Petrofabric Diagrams, by John C. Haff (*American Mineralogist*, September, 1938). This is among the first, if not, the first paper to present in English the detailed technique of preparing petrofabric diagrams. The technique of studying rock fabrics was developed abroad by Schmidt and Sander, and it is only during the last five years that American petrologists have begun to write upon it. The author who has studied with Sander in Innsbruck presents a well-illustrated and clearly written account of the accepted procedure, which may serve as a guide to many wishing to become better acquainted with it.

GEOMORPHOLOGY. See GEOLOGY.
GEORGE WASHINGTON UNIVERSITY. THE. A nonsectarian institution of higher learning for men and women in Washington, D. C., founded in 1821. The enrollment for the first semester of 1938-39 was 5968. The enrollment in the 1938 summer session was 1613. The faculty numbered 401.

The Law School this fall inaugurated an enlarged program of research in the field of public law, and coincidentally expanded its *Law Review* from a quarterly to a monthly, to be published eight times a year, from November through June. In a development of the program for graduate study in the School of Education, eight outstanding educational leaders, including state and Federal officials and officers of educational foundations and professional bodies, were appointed Adjunct Professors to assist with doctoral studies. The Department of Journalism was expanded, with the appointment of three new members of the teaching staff and the addition of new courses.

The Hall of Government, gift of Mrs. Henry Alvah Strong, was opened in September and houses the University's School of Government. Work is under way on the new Lisner Library. The auditorium, a second gift of the late Abram Lisner, is to be started this year.

The total endowment amounted to \$2,600,000, from which the income of 1937-38 was \$80,846. The total income from all sources was \$1,457,900. The library contained more than 119,000 volumes. President, Cloyd H. Marvin, Ph.D., LL.D.

GEORGIA. Area and Population. Area, 59,265 square miles; included (1930) water, 540 square miles. Population: Apr. 1, 1930 (census), 2,908,506; July 1, 1937 (Federal estimate), 3,085,000; 1920 (census), 2,895,832. Atlanta, the capital, had (1930) 270,366 inhabitants.

Agriculture. Acreage, production, and value of the chief crops of Georgia, for 1938 and 1937, appear in the accompanying table on page 284.

Mineral Production. Apart from clay and clay products, the chief component of Georgia's yearly total value of mineral output of \$12,640,232 (for 1936) was stone of divers sorts. This included granite, to the value of \$875,529 for 1937, as against \$920,355 for 1936, and marble to the total of \$1,030,407 (1937), as against \$1,841,407 (1936).

Finance. Georgia's State expenditures in the year ended June 30, 1937, as reported by the U.S. Bureau of the Census, were: For maintaining and

Crop	Year	Acreage	Prod. Bu.	Value
Cotton	1938	2,064,000	857,000	\$37,280,000
	1937	2,661,000	1,500,000	64,573,000
Corn	1938	4,623,000	53,164,000	29,772,000
	1937	4,203,000	48,334,000	30,934,000
Tobacco	1938	88,200	91,820,000	19,045,000
	1937	80,600	75,013,000	14,986,000
Peanuts	1938	619,000	495,000,000	16,837,000
	1937	530,000	392,200,000	12,943,000
Sweet potatoes	1938	123,000	9,225,000	7,841,000
	1937	114,000	8,550,000	8,806,000
Hay (tame) .	1938	1,085,000	631,000	6,815,000
	1937	935,000	545,000	6,268,000
Peaches	1938	5,320,000	5,320,000
	1937	2,730,000	3,958,000
Oats	1938	426,000	9,585,000	4,026,000
	1937	444,000	8,658,000	5,108,000
